The disease may be epizootic or endemic, but there is no proof of its being contagious; and I am of opinion that it arises from some local cause, and think that a careful perusal of this letter leads to this supposition. The black-faced or *mountain* sheep are those alone, he says, which are liable to this disease. This appears at first somewhat surprising; but there may be some cause producing the predisposition in *their* system, which our unacquaintance of *all* the facts regarding it, involves in mystery, or the circumstance of the disease may be purely accidental. But there is one natural cause which may operate, which is, that should the marshy part of the pasture send up a rank aftermath, it may stimulate and excite the mucous coat of the bowels too much. The probability of this being the true cause of the disease in this particular case, is strengthened from the nature of the weather during the last summer, and immediately preceding the date of Mr. Chalmer's letter. In May and June the drought was so severe in many parts of the country, that the pasture was withered up, particularly in dry situations; but in marshy or boggy situations, the heat produced an extraordinary degree of vegetation. And, I believe it is found, that sheep coming from a poor walk, to a rich pasture, which is the usual course of management of black-faced sheep when removed directly from the hills, will be more liable to the disease than sheep which have always been accustomed to such pasture; and after such a sudden change of food, there is no part of the animal economy so likely to be affected as the bowels. In the present instance, I firmly believe the marshy pasture to be the immediate cause of the disease. The sheep ought therefore to be allowed to browse but sparingly on such pasture.

The treatment I would recommend in such a disease, is to remove the irritating matter from the bowels by some mild laxative, and combine it with an opiate, to allay the pain in the bowels. For this purpose, from one to two ounces of castor or linseed oil, or one or two ounces of Epsom salts may be given with from thirty to fifty drops of laudanum; and if these do not allay the pain and stop the purging, half a dram more of laudanum, with two drams of chalk, may be administered in a little milk, or starch or oatmeal gruel, and repeated till an effect is produced; but frequently sweet-milk alone, or that mixed with a little chalk, will prove sufficient. The Epsom salts, however, are more to be depended upon, especially in cases which run their course rapidly. It will also be advisable to house the affected sheep for a day or two, and feed them upon hay if they will eat it, if not, to give them oatmeal or starch gruel. When the sheep suffer much pain, fomentations of hot water should be frequently applied to the belly.

In the particular case mentioned, the progress of the disease seems to have been more rapid than is usually noticed. The principal chance of curing it will therefore depend upon its discovery at an early stage. If this is done, little other treatment than a dose of salts will be necessary; but in ordinary cases of dysentery, the disease lingers about the animal for several days, and even weeks, when a different treatment may be required;—a continuation of astringent medicines must then be persisted in before the disease may be subdued.

The preceding case shows the injurious effects of

certain kinds of food, or rather perhaps the injurious effects of food grown under particular circumstances. Many sheep-farmers can too dearly testify, even in the present season, to the truth of this remark, by the loss which has been sustained by sickness of from four to six in the score in a short period. Sickness is a disease which there is every reason for believing arises from the strong after-growth which springs up from rain after dry weather, in autumn, producing sudden derangement of the stomach and bowels. Although sickness is not characterized by all the symptoms in the preceding case, it is still an affection of the bowels, differing only from the other in some of its symptoms, perhaps from the rapidity of its progress, or the particular part of the stomach or intestines which is affected by the inducing cause.

That a sudden change in the *condition of the food*, or in the food itself, has an effect upon animals which feed upon it, is a fact which none will deny, but which the following cases appear to me strongly to corroborate and illustrate. Last year, 1833, Mr. Hardie, Balbegie, about three miles north from Kirkcaldy, in Fifeshire, turned out fifteen cattle, mostly of the Fifeshire breed, about the beginning of May, to graze in a field which had been laid down in the preceding year with rye-grass and clover, and which yielded a good rank crop of grass. On the third day after the cattle had been put out, a heavy rain fell, the weather having been previously very dry for a considerable time. There was no water in the field except in a small pond and some ditches, and it was extremely disagreeable and brackish to the taste. The land was poor, and had been lately taken into tillage. On the evening of the third day, one of the cattle was taken ill, and on the following day five more were similarly affected, and the day after that other two. The remainder were immediately removed to another field, where they all thrived well, being unafflicted with the disease. Those which were taken ill were bled as soon as observed, to the extent of about a Scotch pint from each; and a large dose of castor oil given, but which did not operate. Blisters were also applied to the head, but in the course of four or five days they all died in a state of delirium.

About the same period this year, Mr. Hardie turned out into the same field, and the one adjoining, which had come into pasture, twenty-six cattle, one and two-year olds, of the same breed. For the first fortnight they were housed in the straw-yard at night, but were afterwards allowed to remain constantly in the field, and they continued to thrive and were quite healthy until the night of the 10th June. For a considerable time previous to this, the weather had been very dry, and the grass almost withered up, or at least it contained much less succulence than is usual at that season of the year. During that night a considerable quantity of rain fell, but the weather was mild, and continued so for some days afterwards. On the morning of the 11th, one of the stots was found dead, and many of the rest unwell. The latter seemed dull and somewhat stupid, their eyes having a fixed appearance, and glassy. All the cattle were immediately removed from that field; those which were well were put into another field, where several of them in succession became similarly affected. The sick ones were taken into the house and bled, about two Scotch pints of blood being taken from each, and a quantity of molasses and salts given as a purge, but which did not operate. The eight which had been first afflicted and thus treated, died.

I was then sent for, and found that the disease arose from inflammation of the true stomach, producing a degree of affection in the brain similar to stomach staggers in the horse. Those which were

still affected, seven in number, had the pulse varying from 30 to 100, and small, and they had a strong inclination to press forward with the head against any thing that came in their way, but especially in a corner. Others were at times in a state of high delirium, scrambling upon the walls with their fore-feet, their respiration rather hurried, appetite gone, bowels inactive. I recommended repetitions of the bleeding even to faintness, and large doses of purgative medicine to be given in large quantities of gruel, and cold water applied frequently to the head, and these all recovered.

But the object of my being sent for was as much with a view to ascertain the cause of the disease, as to cure those already affected, as it was generally believed that they had been poisoned. Those which had died had been examined, and in all the four, the stomach had been found in a state of inflammation, and the villous coat much thickened. I was unable to learn any farther particulars as to the post-mortem appearances, as I had not an opportunity of examining them myself. I could not, however, see how or why they should have been poisoned, and therefore went and took a survey of the field. I first examined how it was supplied with water; this was done by means of a small pond, which collected the surface water from one or two drains or ditches, by the hedge side. The heat of the season had dried up all the drains and ditches, and there was no water anywhere, except in the small pond, although there had been several showers between the time the cattle had been taken ill, and when I visited them. The water which is in the pond, was certainly the worst I ever tasted, having the flavour of being exposed to the smoke of coals, and very brackish. Indeed, so disagreeable was it, that I am sure that the cattle must have been perishing for thirst, before they could have drunk it, and the drinking of it would have produced a contrary effect to allaying thirst. The cattle had not been thriving for some time, which was attributed to the failing of the grass by the heat; but this did not appear to me to be the cause, for although the soil was poor, and the grass thin, it neither appeared to have been eaten too bare, nor overstocked.

From the circumstances which I have stated, it appears to me that the disease had arisen from a sudden change in the condition of the grass. The agreeableness of moist food to a palate parched with thirst, I need not stop to describe; and if the cattle were circumstanced as I have described, and of which there cannot be a doubt, is there any effect so likely to be produced on them, as the injury from the food being in the condition in which I have stated? That moist grass will produce derangement of the stomach and bowels, I need not tell any agriculturist, dear-bought experience having feelingly demonstrated to him how readily bloat is produced in cattle by wet clover, and how speedily inflammation of the stomach and bowels will take place in horses from the same cause. But the case of Mr. Hardie's cattle is of itself sufficient, to my mind, to illustrate this point, for as soon as rain fell after dry and hot weather, the disease attacked the cattle both this year and the last. To this view of the case, some may say that although the disease may have depended upon the change of weather, it did not necessarily depend upon the change produced by the weather upon the food, but in all probability upon an immediate effect on the bodies of the animals. To this I would reply, that I have seen other examples of this disease having been produced by a sudden change of food. Five years ago, about 200 head of Highland cattle were bought to feed at a distillery in this neighbourhood, and when tied to the stake, were immediately put

upon draff and dreg, with a small allowance of straw for food. In a few days a considerable number were attacked by the same disease as that which seized Mr. Hardie's cattle. Three died at the onset of the disease, and the rest recovered, by effecting a gradual change from their former food to the dreg, upon which they afterwards fattened as well as cattle usually do on that kind of food. Sudden changes of food, or in the condition of food, is attended with considerable danger, and we ought therefore to look rather to those circumstances, and endeavour to rectify them, than to harbour suspicions which the peculiar appearance of such diseases might excite.

### IMPROVED HARROW.

The thanks of the Society of Arts have been voted to Mr. T. JOHNSTON, 137, George-street, Glasgow, for his Break-Harrow.

This harrow has been tried on a small scale with full success.

It is composed of two equal and similar frames, joined together as shewn in the figure, the two chains of the splinter-bar being attached to the front piece of each frame, so far to the left of its middle as to give a general oblique position to the harrow when in use. Each frame consists of three longitudinal iron bars, above which, and resting upon them, are two diagonal bars, and above all three cross bars. These are all kept in their places by nine quadrangular bolts, with screw-nuts above, so that the frame may be taken to pieces and put together again in a few minutes. The diagonal bars have six tines on each, directed obliquely and alternately to the right and left; the other twenty tines (eighteen on the three longitudinal, and twelve on the three cross-bars) are perpendicular as usual.

The chief novelty consists in the oblique tines placed on the diagonal bars, which thus peculiarly fit the instrument for advantageous use on coarse land, and in laying the cross-bars above the others, by which less obstruction is given to the progress of the harrow, and it is less liable to jump.

THE POTATOE.—Mr. Hickey has communicated to the *Irish Farmer's Journal* a very singular and successful experiment, tried upon the potatoe in the county of Dublin. A gentleman who holds a farm of

150 acres, planted in the usual manner 34 acres under potatoes in 1832; the result was, a complete failure of the crop. This induced him to try many experiments upon the root, all of which failed except the following:—He took six potatoes and divided them into twenty cuts—he then got a large basin of water, into which he put a cupful of salt and a piece of blue stone about the size of a walnut. He put ten of the cuts into the basin, and let them remain there one entire night. On the following day he procured a very strong microscope, through which he examined the entire twenty cuts. On the ten cuts which were not immersed in the basin he could distinctly perceive many small white particlees like eggs; and those cuts which were immersed presented no such appearance whatsoever. This discovery urged him to follow up the examination attentively, and every day, for a short period, he continued to watch the appearance of the aforesaid matter. The result was, that those white globular particles were animalculæ, for in a few days they became quite visible to the naked eye in the form of worms or maggots. The cuts that had been steeped never showed the slightest appearance of any such thing, and they retained their solidity and firmness when the other ten cuts were completely decayed and rotted. Still unwilling to believe without further proof, he tried the experiment five or six times, and planted them, distinctly marking a division between those cuts which were steeped and those that were not. The consequence was, the almost total failure of the one kind and the complete success of the other placed the question beyond the possibility of a doubt. He considers that the air has a powerful effect upon the potatoe, and may sometimes impregnate it with this destructive matter.

#### TO THE EDITOR OF THE "FARMER'S MAGAZINE."

Sir,—Will you do me the favour to insert in your next Magazine the following corrections of mistakes which your printer has made in my letter, which appeared in your last number, under the head of "Malt Tax and Beer-Shops?"

I assure you I do not impute blame to your printer on this score; it would be unreasonable of me to do so; because I have often great difficulty, after having written a letter, to read it *correctly* before I seal it; and if I cannot read my own writing, I think it would be very unfair in me to blame others for not being able to do so. I think this explanation will serve my purpose, both for the past, and on future occasions; and, in the course of my correspondence, wherever your readers meet with a word or sentence which is on the face of it incorrect, I beg they will remember the confession that I have just made—that it proceeds from the pen of a man who cannot always read his own writing, and exert a little of their own ingenuity to eke out the sentence. The first mistake which occurs, and of which I beg your correction, is in the second sentence of the letter to which I have called your attention. I wrote, or intended to write, "my eye inadvertently glanced down the two columns—and not to two columns." The next mistake is in the same sentence; for *Beer and Hops*, read "*Beer-shops*." Having done more injury to *moral society*, read "*rural society*." For *brew both a better and cheaper beverage*, read "*to brew*," &c., &c. In the fifth paragraph, there is a full stop at Ireland; but the sentence ought

to have been carried on to the next full stop. In the same sentence for *sowing of clover*, read "*mowing of clover*." Again—*All this is hard work, indeed, employed in these matters*. Now, after the last word "*matters*," there is a full stop; but the sentence ought to have been carried on. For *senseless individuals* in the sixth paragraph, read "*numberless individuals*;" and, in the next paragraph, for *the gin-shops*, read "*these gin-shops*." For *unseasonable abuse*, read "*unreasonable abuse*;" for *head of the parish*, read "*heads of the parish*." In the tenth paragraph, for *few of the number*, read "*fear of the number*;" and, in the next, and last paragraph, for *lighter in respect*, &c., read "*higher in respect*, &c."

I do not for a moment apprehend that it is necessary for me to correct these errors in order to support the principle which that letter advocates, namely—the destruction of the *Beer-shops* to be effected by the repeal of the MALT TAX; because, I think, nine-tenths of your readers, or, indeed, nine-tenths of the community, concur in that principle; indeed, I never recollect any subject on which men appeared to me to be so nearly unanimous as they are on this. It is true one may find a few maltsters and brewers to declare that such a step would be alike unjust and futile; in fact, that it would do mischief, and cause us to be a community of drunkards; but how or why this is to be, they do not explain—I should, perhaps, say, they cannot explain; for I sincerely believe that never, under *any* circumstances, would it be possible to invent *any* system so destructive to the morals of the lower orders as the present system of Beer-shops.

Sir Edward Knatchbull's "Beer Amendment Bill" of last Session has, in no degree, answered the object it was intended to effect. It is true it puts the power of licensing the houses into the hands of that portion of society rated at not less than ten pounds a-year. Now it does not require a very extended knowledge of human nature to perceive that this power, invested in such a class of persons, would be made subservient to the worst of passions. I could exemplify this to be the case in many instances that have occurred in my own immediate neighbourhood; but I must refrain from so doing, in order to avoid calling down on myself any portion of those highly-excited party feelings which have been engendered entirely by this well-meant, but short-sighted act, of the Legislature. It would be only candid, possibly, to admit, that in the parish in which I reside, we have been enabled to get rid of the only beer-shop it contained, by the above provision, of a certificate signed by six persons rated at ten pounds each: then this is of but little service, because, in the immediate adjoining parishes, where property is held under different circumstances, every beer-shop that was licensed before the passing of the Act of last Session, still remains so, and many others have been added to the "motley group." Probably, before this appears in your next number, some decided steps will have been taken by the House of Commons on the subject of the Malt Tax; to repeal which, I hope the Government, if not inclined to render to the wishes of, by far the greater part of the community, may be

obliged to yield to an overwhelming majority of the House of Commons.

But, although the repeal of the Malt Tax would be an immense boon granted to the agricultural interest, let it not be supposed for a moment that the beneficial effects would be confined to this interest only; neither let it be thought, that it would be any *direct* relief, either to the owner or occupier of the soil. The squire and farmer, it is true, would then be enabled to buy Malt cheaper, and to this extent, would, of course, be *directly* relieved; but it is the labourer whose circumstances would be immediately improved by being able to *brew beer at home*, instead of being driven to the necessity of procuring it at the beer-shops; and *this is the great object to be gained*, the acquisition of which would ensure an indirect benefit to the landlord and tenant, by improving the moral condition of their labourers. I have often heard it stated by persons, who are, in fact, opposed to the present system of Corn Laws, (but to whom it would be *inconvenient* to make an unreserved declaration of this nature), that it would be unjust to disturb those laws so long as the Malt Tax existed; but, immediately on the repeal of that tax, they would be prepared to set about a repeal of the Corn Laws. I cannot refrain from having a few words with reasoners of this description. If, by the repeal of the Malt Tax, I am to understand that the "National Debt" is paid off, and, consequently, the Government has no longer occasion for raising the amount of revenue necessary to pay the interest of that debt, then I know no reason why the Corn Laws should not be also immediately repealed; because, I have always thought that it was necessary to protect the English farmer in the price of his corn, in order that he might be enabled to pay high taxes, for the purpose of those taxes being applied to pay the interest of this debt.

But, if the "National Debt" be not paid off, and the repeal of the Malt Tax, means only the raising of so much revenue from some other source, but still to be applied to the same purpose, namely—the paying the interest of the debt; then, it appears to me, the *necessity* of protecting the farmer in the price of his corn, in order to enable him to continue to pay his share of the interest of the debt is, in no degree, lessened. This opinion, I am aware, may be disputed. I wish to be understood, that I advance it entirely under the conviction, that the farmer would only be relieved by the repeal of the Malt Tax in the manner I have stated above, and the consequence of selling his wheat at four pounds per load less than he has done on the average of the last seven years, (and which, if the Corn Laws should be repealed, he would assuredly be obliged to do), would not be less likely to ruin him, because the Malt Tax was repealed.—I am, Sir, your obedient and very humble servant,

AGRICULTUR.

Sussex, March 11, 1835.

### ANALYSIS OF MARL.

The value of marl, as a manure, must of course be referable to the nature of the different kinds employed. It is, indeed, evident that, being in-

tended to correct or improve the soil, its constituent parts should be known, and their qualities explained, before any use can be rationally made of it; and, therefore, the more accurately its properties are ascertained, the more confident may the propriety of its application be determined. Farmers, indeed, cannot be expected to be sufficiently acquainted with chemistry to be able to analyse it, though the most calcareous sorts may be known by means of acids, as applied to lime: or, the common earthy kind, when put into water, will fall to pieces, allowing a considerable portion of sand to fall to the bottom of the vessel: by which simple tests, they might often derive considerable advantage. Its qualities are, however, more generally taken, by mere practical men, more upon trust derived from the experience of their neighbours than from any actual knowledge of its properties; but although, when thus guided, they cannot go far wrong, yet they may be misled by circumstances of slight apparent difference, and, in cases of new pits being opened, no certain estimate of its effect can be formed until a complete analysis has been made. This should, indeed, be done in all such instances; for it costs but a trifle, is easily performed, and without having recourse for the purpose to a regular scientific chemist, the object may be attained by application to any intelligent apothecary, by furnishing him with the following account of the modes of procedure:—

The ingredient of marls, on which their fitness for agricultural purposes depends, is the carbonate of lime. It is owing to the presence of this earth that marls effervesce on the addition of acids, which is one of their distinguishing characters: to ascertain which—

"Let the marls be put into a glass, partly filled with water, which will expel a portion of acid contained mechanically in the marl, and thus obviate one source of fallacy. When the marl is thoroughly penetrated by the water, add a little muriatic acid or spirit of salt. If a discharge of air should ensue, the marly nature of the earth will be sufficiently established."

Then, to find their composition—

"Pour a few ounces of diluted muriatic acid into a Florence flask, place them in a scale and let them be balanced. Then reduce a few ounces of dried marl into powder, and let this powder be carefully and gradually thrown into the flask, until, after repeated additions, no further effervescence is perceived. Let the remainder of the powdered marl be weighed, by which the quantity projected will be known. Let the balance be then restored. The difference of weight between the quantity projected, and that requisite to restore the balance, will show the weight of the air lost during the effervescence, and will stand thus,—

"If the loss amount to 13 *per cent.* of the quantity of marl projected, or from 13 to 32 *per cent.*, the marl assayed is calcareous marl, or rich calcareous earth.

"Clayey marls, or those in which the agillaceous ingredient prevails, lose only 8 or 10 *per cent.* of their weight by this treatment; and sandy marls about the same proportion. The presence of much agillaceous earth may be judged by digging the marl, after being washed with spirit of salt, when it will harden, and form a brick.

## CURIOUS BEQUESTS.

EXTRACTED FROM THE REPORT OF THE COMMISSIONERS ON CHARITIES.

**ALMS-COW.**—In the parish of Waddesdon, Bucks, there is a statement that the benefit of *two* cows was distributed yearly amongst twenty-two people of that parish, by the Duke of Marlborough.

The milk of *one* cow kept for that purpose by a tenant of the Duke, occupying Lodge Hill Farm, is now received daily by twenty-two parishioners, in rotation, one in the morning and another in the evening. The distribution of the milk of the second cow was discontinued in 1825, the tenant of the farm refusing at that time to keep two cows for the poor, as the allowance mentioned below had become insufficient to defray the expense. The cow is called "the alms-cow," and when she dies or grows barren, another is provided by the tenant. The poor made no complaint when the second cow was discontinued. Mr. Raine informed the Commissioners by letter that since he had been receiver of the Duke's estates, he had allowed 10*l* for the keep of one cow, and his predecessors had done so before him.

**GANG MONDAY LAND.**—There is about an acre of land in the parish of Edgcott, so called, in respect of which Robert Marcham, Esq. pays the overseers about 3*l*. yearly. This was formerly distributed in cakes and beer to the tenants: two cakes each, and as much beer as they chose to drink at the time, the residue being given to all poor persons who came for it, whether parishioners or not. Since the inclosure, about thirty years ago, this sum has been distributed at Christmas in coals. Before the inclosure, the poor had a right to get fuel on the common; since the inclosure, Mr. Marcham has paid about 3*l*. more in respect of this right, and it is distributed also yearly at Christmas in coals,—each person's share amounting to about four hundred pounds weight.

**THE STEPHENAGE MONEY.**—There was formerly a custom in the parish of Drayton Beauchamp, called "Stephening." All the inhabitants of the parish used to go on St. Stephen's day to the rectory, and eat as much bread and cheese, and drink as much ale, as they chose, at the expense of the rector. The usage occasioned so much rioting, that the late rector discontinued it, and distributed an annual sum of money instead, in proportion to the number of claimants; but they increased so considerably in 1827, that he withheld the annual payments. A similar custom existed in the parish of Great Harwood until about seventeen years ago: the rector gave each poor person a quatern loaf and two ounces of cheese—this was called "Stephening."

**WHEAT.**—Forty-nine bushels of wheat are yearly sent by Lady Bridgewater to the mill to be ground, and the flour to be made into four pound loaves, at her expense, and distributed to the poor of Edlesborough. This charity is said to have originated in a donor named Randall, about 1597.

**STREWING.**—At Wingrave, there is piece of land left for the purpose of furnishing rushes for the parish church on the feast Sunday. It consists of about three roods, let at a guinea a-year, which is received by the parish clerk, who provides grass to strew the church on the village feast day, which is the first Sunday after St. Peter's day.

**DOLE OF HERRINGS.**—Richard Stokes, parson of Loughton, in 1546, left lands in that parish subjecting the holder thereof, annually for ever, to distribute to the dwellers and inhabitants of every house in Loughton, ten white herrings and ten red herrings. It ap-

pears that this gift has been discontinued; but the old people of the parish remember it, and James Walter, a man about sixty, recollects having carried herrings to the church for distribution.

**MALTHUSIAN AND ANTI-MALTHUSIAN CHARITIES.**—John Bowsher of Chepstow, by will, in 1818, gave to ten poor bachelors of that parish, of sixty years and upwards, 2,000*l*., or so much as would pay four shillings per week to each; in default of bachelors, then to poor men of Chepstow.

At Griadon Underwood, there is a yearly sum arising out of charitable donations for apprenticing illegitimate boys or girls. The premiums given are 12*l*. with girls, and 30*l*. with boys.

**BIBLES.**—John Cory left forty shillings a-year to the senior alderman of Fybridge Ward, Norwich, to buy as many bibles as the same would extend to, and to give them to eleven poor children, one in each parish. The Commissioners observe that in May, 1833, there were three years' rent charge due; and it was represented to them that although the receiver had taken pains to give this charity publicity, yet it was extraordinary that there should not be sufficient applications annually to exhaust so small a sum. P.Q.

## ON THE PRESENT AGRICULTURAL DISTRESS.

TO THE EDITOR OF THE NORTHAMPTON MERCURY.

Sir,—It has been requested of those engaged in farming in this county, to search out the causes of the present agricultural distress, and also to state by what means its progress can be arrested. There is not, I conceive, much difficulty attached to the first request, but a great deal to the second. The cause of the distress is, that wheat, which is the farmer's chief dependence to pay his rent, is sold at a lower price than he can afford it for. The cause of the lowness of price is that the supply to the markets is greater than the demand, the reasons for which in my opinion are these. From the last two or three autumnal seasons being remarkably favourable for wheat seeding, much more than the usual quantity has been sown, and the crops have proved full average ones. From the same favourable seasons also, and from effective draining, vast quantities of wheat have been grown in the fens, where wheat never grew before, and the crops there have proved most abundant. To which may be added, the great quantities of wheat imported from Ireland, and the inability of the great portion of the farmers to hold their wheat till it might fetch a better price; and in some parts of the kingdom the few farmers that could keep it, not liking in these times to have crowded stack-yards, and not feeling confident that there might be no alteration in the corn laws.

Some assert that the progress of this distress would be effectually arrested by the circulation of one-pound notes. Corn would then no doubt nominally bear a higher price; but let me remind the farmers who are for again having one-pound notes, that in such a case the present scale of duties on the importation of foreign corn would not be high enough. There may be some doubt as to the policy of the change that was made in the currency, but it appears to me to be quite out of the question now to think of reverting to a depreciated paper currency. Government loans to farmers have been mentioned. A loan to one engaged in a profitable concern may be of great use to him, but to one in a losing concern it can, at best, but defer the day when he appears before the world a ruined man. Most of those persons who are unac-

quainted with farming, fancy that the farmer's present distress might at once be relieved by a reduction of rents; this is a most mistaken notion, as I trust I shall be able to prove. Rents at all times have been, and must continue to be, estimated by the expected price of wheat. That price of late years, I believe to have been 7s per bushel. Now if the average price continues to be only 5s per bushel, and other grain in proportion, although one-half of the rents of good land, and two-thirds of the rent of poor land, were abated, in neither case would the occupiers of such lands be relieved from distress.

Statement of the effect of an abatement of two-thirds of the rent of an arable clay land farm of 200 acres, at 25s per acre, with the prices of wheat reduced from 56s per qr to 40s (as it must be if wheat continues at such a price); barley, from 30s to 22s, and oats from 23s to 18s. Presuming a succession of crops in something like the following order:—

|                                                  | per qr. | £    | s. | d. |
|--------------------------------------------------|---------|------|----|----|
| 30 acres wheat, 90 qrs. less in value, 16s.      | 72      | 15   | 0  |    |
| 30 .. barley, 120 .....                          | 8s.     | 48   | 0  | 0  |
| 30 .. oats, 150 .....                            | 5s.     | 37   | 10 | 0  |
| (If beans were grown there would be equal loss.) |         |      |    |    |
| 60 .. clover—sheep make less by .....            | 60      | 0    | 0  |    |
| 20 .. pasture—beasts less by .....               | 25      | 0    | 0  |    |

Some imagine that relief from poor-rates would

much lessen the distress. The poor-rates are always considered in the rents; many farmers are distressed who have scarcely any poor-rates to pay. In populous parishes, where the rates are high, great savings might be made, if the occupiers of the land were always unanimous as to the employment and the good management of the poor. About twenty years ago, I proposed in the Farmer's Journal, a plan for making, to a certain extent, the maintenance of the poor a national concern. I have from reflection been since convinced that such great abuses would creep into any arrangements consequent upon that plan, that the idea ought to be abandoned. County rates ought to be more equalised, and reduced to what they were in old times. The statute duty which the occupiers of the land are called upon to perform, ought to be paid for out of the turnpike trust funds. I do not know how far it would be practicable, with our commercial arrangements, but if the duties on foreign butter, cheese, and tallow, were increased, it would benefit many English and Irish occupiers of land. The fairest way of making up any deficiency in the revenue by taking off the malt tax would be by a small property tax, and thus bring in to pay taxes those who now escape—the misers and absentees. Some farmers are of opinion that taking off the tax on malt would benefit them so little as not to justify a step which would involve the financial arrangements of the country in difficulties. Most assuredly it would not, if on full investigation it should appear likely to give but very trifling relief to the agriculturist. I am, however, of opinion that there is no one act within the power of government that would be likely to afford greater relief. The annual amount derived from this tax is said to be four millions and a half; there need not, however, be so great a loss to the revenue to give to the working classes untaxed beer; for a great portion of the malt is used in the distilleries, and of course such an additional duty would be laid on distillation as would keep spirits at their present prices, or perhaps increase them, and thus decrease the loss of revenue from the repeal of the tax. All taxation should be so levied, that every person may contribute to the expenditure of the state in proportion to his means; therefore, luxuries, not necessities, should be taxed. Beer is a necessary for the working classes. But although it may be the general wish to have beer cheap, it cannot be to have spirits so; in fact, those who have witnessed the sad, disgusting excess to which gin has been drunk by the lower orders of late years in large towns, must wish, in mercy to them, that it were dearer. It is said that if the distillers were not obliged to use malt, they would use barley, that one bushel of the latter would answer the purpose of two of the former. Now if this is a fact, as the exciseman must always be in attendance where distillation is going on, if spirits are obtained at a cheaper rate from barley than from malt, of course the government must increase the duty accordingly. The tax on malt falls heavier on those occupied in farming, than on others who are engaged in trade. A farmer who sells produce during the year to the amount of one thousand pounds, and who must employ labourers, and find them beer, to raise that produce, pays more than double by the tax on malt, than the shopkeeper, who in the year sells goods to the amount of five thousand pounds; or persons living in towns with incomes of a thousand a year.

An able writer in the British Farmers' Magazine on agriculture and the general statistics of

the country, says the present depression in the price of wheat may very easily be rectified by the farmers withholding their corn from market. This would be most salutary advice, if it were possible to act upon it, but unfortunately it is not, for all farmers must during the winter thresh out their usual quantity of corn, for the straw to be made into manure by their cattle for their spring crops; and besides, most of the farmers who have capital sufficient to keep their corn when threshed, cannot do so from the want of convenience to keep it in a good state, free from injury by rats and mice.

If the tax were taken off, more beer would be drunk; more malt necessarily made; besides which, if it were not taxed, more would be used in the public breweries, where it is evident, from the taste of some of the beer brewed there, compared with home-brewed, substitutes for malt, such as sugar, molasses, &c. must have been made use of. By thus increasing the demand for barley, a greater quantity would be sown, and a less quantity of wheat, and probably thus prevent the wheat market from being so overstocked as it has of late been.

As to what has been said about the necessity of having cheap corn, in order that our manufacturers may supply the whole world with cheap goods, it is all a fallacy; for goods have been sent since the present agricultural protection has been in existence to all parts where they have been wanted, and will continue to be so sent, so long as this country possesses these combined advantages which no other does, viz.—its inexhaustible coal and metal mines, its superior machinery, and the certain continuation of the power of working it; the greater skill and larger capital of its manufacturers, the immense capital of its merchants, its innumerable shipping, and the facility with which goods from any part of the kingdom can be shipped for their destination.

To such an extent is machinery now in use in all our manufactories, and to such perfection is it brought, that quantities of cotton, the produce of China, have of late been brought into this country, have been manufactured into goods suited to China, and sent out there; and notwithstanding the great expenses of freight and insurance on the importation of the raw material, and on the exportation of the manufactured goods, the manufacturers' and the merchants' profits, such goods are enabled to be sold in the Chinese market at a less price than the same description of goods manufactured in China can be sold for, although the wages of the operative manufacturers do not there exceed one penny a-day.

The price that wheat is sold for in any country does not prove whether it is there cheap or dear. Where the price is low, and the wages of the working classes are so low that they cannot obtain wheaten bread, and therefore live on a coarser kind, made of rye and the tail of wheat (as is now the case in many parts of the continent,) in such countries it cannot be called cheap; nor where it is nominally high, with corresponding wages, can it be called dear. It has been said, during the late election, "that the time of taking off the malt tax should be considered the exact time to do away with the corn laws"—just as if farmers only would be benefited by the abolition of the tax. This is mere electioneering talk to please borough electors. Notwithstanding all that the advocates of free trade can say, I have no idea that a majority will be found in the House of Commons for the abolition of all corn laws, or in fact to agree to any

alteration of the present protection to farmers, who by the law of the land, are heavily burdened with the maintenance of the poor, and therefore have a just right to be protected from an influx of foreign corn, when the price of the corn of the country is not higher than it ought to be. I cannot say what may be the feelings of the generality of the fundholders, but for my own part I feel certain that it would be impossible long to continue paying the present interest of the national debt with a free trade in corn: for on the price of wheat depends the capability of those on whom it falls to pay a very great portion of the taxes of the country.

It is the opinion of some farmers, and some landlords also, that a fixed duty on the importation of corn would be of more benefit to farmers than the graduated scale of duties has been. The objections to a fixed duty are too numerous to be entered into in this paper. I shall only observe, that it must be desirable for the majority of farmers to have a steady price for their corn, which in my opinion they are more likely to have with a graduated scale than with a fixed duty, though just the present time may appear to afford an evidence to the contrary. Few farmers have been much benefited by a sudden rise in the price of corn, for it has generally occurred at a time when the greater part of them had little or none to sell.

Most of the London newspapers are unfriendly to the farming interest. The writers in those papers want cheap corn, regardless of all the ruinous effect it may have on the British farmers. They may perhaps be deceived by persons interested in the foreign corn trade, but they are continually inserting in their papers incorrect statements of the prices of corn, which create, among their readers engaged in trade, prejudices against the farmers. In a widely circulated Evening Paper of February 3, it is stated, under the head of Foreign Corn, that the average price of wheat at Hamburg was, on the latest accounts received from there, 26s 8d per quarter; and at the same time it was, in Mark-lane, 51s per quarter—wheat, they say, is, therefore, 91½ per cent. dearer in London than in Hamburg. Now the fact is, the average price of wheat in Mark-lane was only 41s per quarter.

Every one must acknowledge that the manufactories of this country are of very great importance to it, by enriching it, and giving employment to a great portion of its population. Agriculture (Dr. Johnson says) "not only gives riches to a nation, but the only riches she can call her own;" and, as it employs a very great portion of the population, there can be no pretence whatever for sacrificing the agriculture of the country, by an unlimited importation of foreign corn, to benefit for a time (and for a short time only) the manufactories. This nation is in an artificial state of prosperity, which can only be retained by artificial means. It would be a kind of national suicide to throw down those barriers by which this prosperity may be retained, to enrich other nations, but to impoverish this. In former times the wealth of this country was supposed to be in the land. The land, therefore, was justly burdened with the maintenance of the poor. If it can now be proved (as the advocates of free trade assert) that the real wealth of this country is its manufactures, the manufacturers ought to bear their share of the burden of the poor.

From what I have witnessed, and from all the accounts I could collect, it appears that the manufactories of this country have scarcely ever been

going on more prosperously than they have during the past year, with the present agricultural protection; why, therefore, should this question be so continually agitated to paralyse the exertions of all occupiers of land? but more particularly those who occupy the cold clay land of the country, where the greatest possible exertions are needed, but where they would be entirely fruitless, with a free trade in corn; for such land, in that case, must be thrown out of cultivation, and the labourers that were employed on it thrown on the parish funds, as long as any such parish shall retain any funds.

Great distress has not yet reached the turnip-land farmers, but it appears to me to be very evident that it soon will; for if nothing is done to assist the farming interest, the prices of barley and oats, after the next harvest, will correspond with the low price of wheat; and as the greater part of the agricultural labourers are accommodated with small portions of land, they are now enabled to feed pigs for their consumption; the demand, therefore, for mutton, is so decreased that the butchers will not much longer be able to give more than 4d per lb. for the best fat sheep, instead of rather more than 6d, which they have been giving for some time past. I am informed, that a baker in a village near me said that, of thirty-three labourers' dinners which he baked on Sunday se'nnight, 31 of them were of pig-meat.

I am one (and I trust a majority of those now engaged in farming are the same) who never wished, or ever shall wish, to see the price of wheat so high that the labouring classes cannot obtain from their earnings as much good bread as they can consume, with a fair portion of good meat, and good wholesome beer, and all the reasonable comforts that a labouring man can desire. The labourers in agriculture know very well, that if corn continues, for any length of time, to be sold at a less price than their employers can afford it, their constant employment is less certain, their wages must be reduced, and consequently their comforts lessened; and I am inclined to believe that a great portion of those who are employed in trades are now quite aware, that if the agriculture of this country falls into decay, the trade of the country must shortly after do the same.

I have never yet heard, nor do I think I am likely to hear, any satisfactory arguments to prove that the general prosperity of this country has been injured, or kept from increasing, since the year 1828—the date of the present protection of British agriculture. I therefore cannot imagine what possible plea there can be for abolishing it, and thus weakening the power of this great country, by making it dependant upon other countries for a portion of the first necessities of life.

The writer of this letter has been practically engaged in farming for more than thirty years, and has written much under different signatures during that period in various agricultural publications, both on agriculture and on subjects connected with it; but having now attained to nearly threescore years and ten, he had determined to turn his mind to more important things. Having, however, been called upon, in common with other agriculturists, to search out the cause of the present distress, and to give an opinion in what way its progress can be arrested, he does not hesitate to answer to that call, though, from the difficulty of the subject, he has felt himself incompetent to the task.

A SMALL OWNER AND OCCUPIER OF LAND  
IN NORTHAMPTONSHIRE.

Th———ds, February 10th, 1835.

## TO THE EDITOR OF THE TIMES.

Sir,—As you have occasionally favoured me by inserting letters of mine in your extensively read paper, I again request of you to publish the following, addressed to the Marquis of Chandos.

My Lord,—I am fully convinced that no one has more zealously and sincerely laboured to benefit the agricultural interest than your Lordship; and though I differ from your Lordship as to the measures by which such benefit would be obtained in one important particular, I trust you will give me credit for an equally sincere desire, which be assured I feel, to relieve and raise that important interest. I pursue the same object, though by different means. I perceive by the public newspapers that you have given notice of your intention to move, on Wednesday next, for the repeal of the duty upon malt. Your Lordship will therefore pardon me if I point out the reasons which have led me to the conclusion that the removal of that duty will not be beneficial either to the agricultural interest or the labouring population, in a degree at all proportionate to the sacrifice it will require.

I will state at once what I think your Lordship will concur in, that the remission of a part of the duty would by no means be expedient, as there would be the same expence of collection, and the same restrictions upon the manufacture. I will therefore hasten to consider the effect of its total repeal.

1. It is argued that the repeal of the malt duty will benefit the cultivators of the soil by producing an increase in the consumption of barley: let us assume the calculation adopted in the act of the 1st. of William IV., that four barrels of beer are made from one quarter of malt. Now, as the duty upon a quarter of malt is 1*l.* 0*s.* 8*d.*, and as there are 576 quarts in 4 barrels, the duty does not amount to a halfpenny a-quart, and even if by a more favourable calculation it did amount to a halfpenny a-quart, I put it to your Lordship to consider whether a reduction to that extent would materially increase the consumption. The only advantage, then, which could accrue to the agriculturist from the repeal of this duty would be one which he would share with all the rest of the kingdom—the diminished charge upon the malt which he himself consumes.

Now in this country on an average (and I have taken some pains to ascertain the fact) not more than 6 quarters of malt are brewed by an occupier of 200 acres of land, so that in my opinion 6*l.* 4*s.* per annum is all the benefit which such an occupier would derive from the repeal of this duty, even supposing that he is not at all affected by the substituted tax which must be proposed.

2. It has been urged that the repeal of the malt duty would enable the labourer to have a cask of beer in his cellar, and to brew his own beer; and this, it has been said, will not only increase the consumption, but have a beneficial effect upon the morals of the poor: but allow me to ask what reason can be assigned why the labourer did not brew his own beer before the 16th of July, 1830 (the date of the act for repealing the beer duty,) when he would thereby have avoided a duty of 10*s.* per barrel, which was only paid by those who brewed for sale? That charge was twice as heavy as the present malt duty. The reason I think is obvious—it was, because he could purchase it cheaper. For the same reason he does not make his own shoes, or his own coat.

Then, as to the temptation of company at the pub-

lic-house or the beer-shop, would it not exist in precisely the same degree if the labourer had a cask of beer in his cellar brewed by himself, as if he had a cask purchased of the public brewer? If there were a disposition to avoid that temptation, and to drink his beer at home with his wife and family, what now prevents the labourer from purchasing a cask of beer and so consuming it? Nothing that would not equally apply to his purchasing malt and brewing his own beer. And if he had a cask, what security is there that his wife or children would not consume the greater part of it while he was absent at his daily labour? And would not he himself be likely to fall into the temptation of consuming it most improvidently either alone or with his companions? I urge these reasons in addition to the indisputable fact, that the same proportionate quantity and strength of beer cannot be extracted from one or two bushels of malt as from 100 bushels—I urge them in addition to the want of skill, the ignorance of the laws and principles of fermentation, and the want of suitable utensils, all which must prevent the poor man from brewing his own beer at a rate at all approaching in cheapness the rate at which he can purchase it.

Having stated these reasons to show that the consumption of barley would not be materially increased, nor the labouring population materially benefited, allow me to urge some of the evils which would attend the repeal of the malt duty, both to the agriculturist and to the kingdom at large.

According to the present mode of collecting the duty, the Excise allow six months' credit upon receiving security. The maltster who has no capital of his own is thereby enabled to carry on his business with the public money, for he can with the greatest facility convert his barley into malt and his malt into money in much less than six months, and the duty which he has received some months before he is called upon to pay it, becomes his capital, and enables him to pay the farmer for his barley on the first market day after the delivery. But for this arrangement maltsters without capital, and that is by far the greater portion of them, would be unable to carry on their business at all, unless the farmers would give them credit for their barley, and thus subject themselves to the risk of bad debts, which it is not likely that they would be willing, or perhaps able, to do. Another class of persons then possessing large capitals, and fewer in number, would embark in the business of malting, the competition would be destroyed, a larger profit would be exacted, and the price being thereby materially raised, a check would at once be given to any benefit expected to arise from increased consumption. The parties therefore who would be the most profited by the removal of the duty are the opulent maltster and the public brewer.

So, as regards the exportation of ale and porter, it would produce rather an injury than good; for a drawback or rather payment of 5s. per barrel, which is equal to the malt duty, is now allowed on exportation. By as much, therefore, as the price of malt (exclusive of duty) will be increased by the repeal of that duty, by so much will the exportation of ale and porter be checked and discouraged; and the quantities now exported to the British colonies are very considerable, and must have no slight effect upon the price of barley in the markets of Great Britain.

Lastly.—A tax amounting to upwards of 5,000,000l cannot be suddenly withdrawn without great inconvenience to the public service. And surely that inconvenience ought not to be incurred but on the most

conclusive grounds, and with the certainty of attaining objects commensurate with the sacrifice. That the agricultural interest is terribly depressed no one can deny, and it is in my mind equally certain that the repeal of the malt duty would afford no adequate relief. But there is, in my humble opinion, a mode of giving effectual relief which has not yet been publicly adverted to, and which is too intricate to be discussed within the limits of this letter, but which I should rejoice to see under the advocacy of your admired talents and influence and zeal.

I have the honour to be, my Lord,

Your very obedient humble servant,

Bury St. Edmund's, BENJAMIN GREENE,  
March 2.

## TO THE EDITOR OF THE HEREFORD TIMES.

Downton.

SIR—In my letter, which appeared in your last number, "*inadvertently*" is printed for "*indirectly*" and I, in consequence, appear to consider myself to have given an opinion, inadvertently, which I subsequently thought erroneous: and I therefore trouble you with another letter.

The advice which I gave to my tenants in this vicinity, and which I thought they had followed with advantage, was, that they should sow less breadth of wheat, and of other corn, and upon ground capable from its condition to afford large crops, and upon such only, my conviction having been, and still being, that at least one-fourth part of the tillage of Herefordshire, and of some other counties, taking the average value of its produce during the last eighteen years, has been tilled during that period with positive loss to the cultivators.

When the price of any article, which is the produce of the country in which it is expended, sinks below its natural value, that is, below the cost of its production, it ceases to be produced; and the consequence generally is, that such article rises in price above its natural value, for a time. The capital which was employed in causing the production of such article is partially, or wholly, withdrawn, and otherwise employed. The effects of an excessively high price operate in every respect in diametrical opposition to this. The very able author of the "*Wealth of Nations*" has compared the variations of price in the market to the oscillations of the pendulum, and has justly observed, that, whatever disturbing cause occasions the pendulum to pass its proper bounds in one direction, will occasion it to pass its proper bounds in the opposite direction. As the pendulum is attracted to the position which places at right angles to the centre of gravity, so the capital manufacturer and farmer is attracted to that kind of occupation where they conceive it can be employed with most advantage. But the price of corn in this country is governed much more by the cost of the production of it in other countries than in this, and therefore, a depression of price, which may ruin the farmer, is without its ordinary corrective. The Corn Bill, which was passed to protect and benefit the farmer, has, in my opinion, been productive of diametrically opposite effects, by having led him, through successive years, to raise an article which has not repaid the cost of its production. To the consumer generally, and to the manufacturer (exclusive, perhaps, of those who work for a foreign market wholly,) the Corn Bill has, I am confident, had the effect of greatly reducing the price of bread,

with a benefit to them; though they have viewed it with very hostile feelings. The panic amongst farmers in the year previous to the passing of the first Corn Bill was so great, at the prospect of being exposed to compete with the untaxed cultivators of the Continent, that I felt strong apprehensions that the decreased quantity of British corn grown would greatly exceed all that of the Continent of Europe and other countries could supply; and at the table of Mr. Dickenson, the then member for Somersetshire, I (who who had never had a bet of two-and-twenty shillings in my life) offered to a gentleman, who differed from me in opinion, to deposit a hundred guineas as a wager, that if a Corn Bill, protective of the British farmer, did not pass within two years, wheat would be sold, within three years, at twenty shillings the bushel. My opponent at first seemed very much disposed to accede to my proposition; but upon hearing the grounds upon which my opinion rested, he declined it.

Our legislators appear to me to have been exceedingly unfortunate in the measures which they have adopted for the benefit of the different classes of society. The Corn Bill, I am quite confident, has been injurious to the agriculturist; and no person will now, I think, have the hardihood to deny, that the Beer-Shops have been injurious alike to the comforts and morals of the labouring classes generally; and, respecting the altered Game Laws, there can scarcely exist two opinions. Respecting this last mentioned, I believe, that many of its clauses were introduced by a party, who were anxious to make it as bad as possible, with the hope of causing it to be rejected; and if such was their motive, I cannot accuse them either of ignorance of the subject, or want of abilities to do mischief. I am not without apprehension of seeing similar evidence of ability in the forthcoming Tithe Commutation Bill. In my last, I contended that, under existing circumstances, the farmer ought to be exonerated from all expenses of repairing roads; but perhaps an exemption from all expenses relative to turnpike-roads is as much as can with convenience and propriety be conceded to him.

I am, Sir, your obedient servant.

T. A KNIGHT.

## TO THE FARMERS OF FIFE.—THE NEW GRAIN MEASURES.

Gentlemen,—By the late Act of Parliament, it is now made imperative on you to use the *Standard Measures* only, and this under the usual pains and penalties. It is therefore quite evident, that grain measured strictly by the standard in the farmer's barn-floor, will not, after being carted and driven to distance, measure out again. For this there must be a remedy. Either the farmer must allow something in addition to the standard, to make his grain remeasure when delivered,—or the merchant, knowing the weight, must lay his account with a certain sure deficiency of measure, in dealing by the legal standard measures. It remains, therefore, with you to say which is to be the rule. It has been too long the practice among farmers to give something considerably more than the standard,—and it is quite notorious that every farmer is known by his measure, and the merchant proportions his price to it. In this way the *fars* have been very materially affected, and in this lies one of the strongest and most just complaints against the existing mode of striking the *fars*.

The opportunity now occurs of remedying this evil. You have only to comply with the strict letter of the law—to sell only by the standard legal measure, with a reference to weight, and let the merchant run the risk of any deficiency of measure that may arise by cartage, and shape his price accordingly. The price per quarter will by this means be lessened, so will your rents, and you will besides have a greater number of quarters to dispose of. By an irregular course, you raise the *fars* and your own rents, and thereby do gross injustice to yourselves, and to all those who make payments of grain by the *fars*.

A FARMER.

## INSTINCT OF A LIONESS.

A seaman, belonging to a wood-party of a ship upon the coast of Africa, had straggled with his companions, and was using his axe freely in the woods, when a large lioness approached him, face to face. The man, for the first moments, gave himself up for lost; but very soon afterward he began to perceive that the manner and expression of countenance of the lioness was mild, and even mournful, and that he had no danger to apprehend from her. She looked at him, and then behind her, and upward into the trees, and went a few steps from him upon the path by which she came; and then returned, and then went again, and acted, in short, much as a dog would act that wished you to follow him. The seaman yielded to her obvious desire, and she led him some little distance, till, near the foot of a tall tree, she stopped, and looked up, with plaintive cries, into its branches. The seaman, directed by her eyes and gestures, looked upward also, and soon discovered, at a considerable height, an ape, dandling and playing with a cub lion, which he had carried thither for his amusement. The wants and wishes of the lioness were now easily understood. The lion species, though usually reckoned among the species of cat, differ absolutely from it in this, as in many other particulars, that it cannot ascend a tree; a distinction, by the way, which ought to satisfy us at once of the error of those who talk to us of lions in America, where in reality there is no lion, and where the puma and jaguar, which they call lions, so readily ascend a tree. But equally in vain would it have been for the sailor to climb after the cub; for the ape, at the best, would have enjoyed the frolic of leaping with his plaything from branch to branch, or from tree to tree as he approached. The only chance, therefore, was to fell the tree before the ape, seated near its top, should have the sagacity to provide against the effect of the strokes of the axe at its bottom. To work, therefore, he went—the lioness, which had seen other trees fallen by the axe of the stranger, standing by, and impatiently waiting the event. The ape kept his seat till the tree fell, and then fell with it; and the lioness, the moment the robber reached the ground, sprang upon him with the swiftness and sureness of a cat springing upon a mouse, killed him, and then, taking her cub in her mouth, walked contentedly away from the benefactor to whose skill and friendly assistance she had made her sorrowful appeal!

## TO THE EDITOR OF THE NORWICH MERCURY.

Sir,—A great deal has been said about the importation of Foreign Corn into England through our Channel Islands. My present object is not to defend this, or any other species of smuggling, but only to show that the effects of such importations have been greatly exaggerated. In the last session of Parliament Mr. Heathcote moved for certain returns connected with this subject, and the result is as follows—

The united imports from Guernsey, Jersey, and the Isle of Man, were, of Wheat—

|               | QRS.   |
|---------------|--------|
| In 1831 ..... | 13,895 |
| 1832 .....    | 17,323 |
| 1833 .....    | 25,065 |

Total 56,283

Annual average, 18,761 quarters.

Now, supposing this to be all foreign wheat, will it justify the assertion made by some, and actually believed by many, that the quantity so obtained has been sufficient to produce the present stagnation of prices? 18,000 quarters, (some of which may be of foreign growth,) thus to affect a consumption of 16 millions of quarters! Sir, Tenterden Steeple being the cause of Goodwin Sands, is a fool to it. But the Whigs, we are told, connived at the practice! This is a serious offence to be sure, *if true*; but if *they* are bad, are not the Tories still worse? What were the imports from the same quarter during the three years preceding those I have mentioned—the Tories, observe, being then in power?

Total 95,867

Annual average, 31,955 quarters.

The Tory Ministers, then, it appears, were nearly twice as extensive smugglers as their opponents, and yet not a word is said of their delinquencies; but the moment it *serves a purpose* to raise a cry, either against the late ministry or their supporters, what a torrent of virtuous indignation is forthwith poured against the aiders and abettors of such transactions!

I have said, the cry was raised to *serve a purpose*—I speak advisedly. That purpose has been to get votes in favour of Tory candidates. In some places it has succeeded. To the credit of the West Norfolk farmers it has utterly failed.

Your's, &c.

S. TAYLOR.

Stoke Ferry, March 2, 1835.

Mr. Editor,—As our own county members, and many others, go to Parliament deeply pledged to support the interests of the farmer, and some of them have distinctly promised to vote for the repeal of the Malt Tax, I take the liberty of addressing the follow observations on that subject. In the first place the advocates for the repeal of the Malt Tax expect that in consequence, barley will be permanently advanced at least 10s per qr.; that this is a false notion I will now prove; I ask by what reasoning, and on what grounds, they have come to this conclusion; have they taken into consideration the price at which the Danes, Prussians, and Germans can grow barley (and of as good quality and weight too as we can)? I fear not. I will now state the present prices of

their barley—the very best that can be purchased at their outports, at 14s a quarter, weighing 15 stone 6 lbs neat; freight to the Eastern Coast of England and other expenses not exceeding 4s 6d to 5s per qr., making say 19s, which added to the duty of 13s 10d will be 32s 10d. Now if the German boors can afford to sell their barley in London at 32s 10d, and they can supply any quantity, is it probable that an advance of even 2s to 3s per qr. can take place, the present average for the country being 32s. You must bear in mind that by the corn law, as it now stands, an advance of 1s a quarter is a reduction of 1s 6d in the duty on foreign barley, an advantage of 50 per cent. in favour of the foreign grower. Why not at once advocate an alteration in the corn law, viz. for barley to work up in the same scale of duties as wheat; this, on a repeal of the Malt Tax, would be a certain and great relief to the farmer; the whole of the five millions that the tax raises would then go into the pockets of our own farmers, whereas, without a prior alteration in the corn law scale of duties, the foreign grower would get at least four-fifths of the amount; the advocating the repeal of the Malt Tax *before* an alteration in the corn law, is putting the cart before the horse; it may be said that barley growers would be the *only parties* benefited, I deny that, a great breadth of barley would be sown, and consequently less wheat, which would bring about an advance in that article, as there would be less wheat grown to be pressed upon the markets. It is also urged that an advance in price is not the only benefit to the farmer that would follow from the repeal of the Malt Tax; the farmer would make his own malt, and the labourer would brew eight or ten gallons of ale in his own cottage copper; I don't believe either would be the case; in the first place, it would not be worth the farmer's while to manufacture, even if he possessed a drying kiln, the little malt he would use as he could buy it cheaper; and I would ask, how is it possible for a labourer existing on the low pittance of 9s a week in winter, and 12s in summer, to save enough to purchase the hops and malt to brew with? If a bushel of malt cost 8s now, and only 5s then, would a labourer with only three-pence to spend, and that is as much, and sometimes more, than they have to spare in the week, be able to buy it? Suppose he could get the malt and hops, two-thirds of them would not work until the ale was finished. It is also well known to practical farmers and all who have paid any attention to the present condition of agricultural labourers, that those men who drink the least beer are decidedly the best servants. The reason is this,—the farmer is so situated that he can't afford more wages to his labourer than will suffice to buy him meat, (letting alone drink) to keep body and soul together,—and those who spend their small earnings in drink apply to the parish for bread and beef, and so become drunken paupers and bad servants; but notwithstanding, I should like to see the time when every able bodied man could buy his quart of ale a day. The greatest consumption of malt takes place in towns, and not in agricultural districts; there are hundreds of farming labourers in this country who don't taste malt liquor from one week's end to another, and it matters little to them whether ale is 2d or 4d a quart if they cannot procure it. As parliament are now meeting, I would particularly urge upon all agricultural associations to petition for an alteration in the corn laws (to the effect that barley should work upon the same scale of duties as wheat,) as well as for the repeal of the Malt Tax. I am quite sure that the repeal of the malt duties *alone* will be of no benefit to the *English* farmer.

I remain, Sir, Your's &c.

Horncastle.

A MERCHANT.

## ON THE USE OF THE STIRRUP IN RIDING.

On this subject (the stirrup) the riding-master preaches the absurd doctrine, or rather the monstrous paradox, that the stirrup adds no safety to the seat—that, in fact, it is a useless appendage, and yet he is never without it! But, adds he, if we are to use the stirrup, let it be as long as possible, and merely the toe or ball of the foot placed in it. Now in direct contradiction, we say, let the stirrup be sufficiently short that you can rise in it so as to clear the pommel of the saddle fairly, and the foot placed in it home—that is, quite up to the instep, or as far as possible—by which, when seated in the saddle, the knee will be considerably bent, and thus that strong lateral pressure or adhesion to the side of the horse, and consequently safety, are acquired, which cannot be accomplished by any other means. If, according to the directions of the professed but unreflecting riding-master, we are to extend our lower extremities to almost a perpendicular position by means of the long stirrup, as the muscles of the thigh and the leg are extended also, and the otherwise powerful knee joint deprived of its compressive strength, we are rendered incapable of effective lateral pressure, and very liable to rupture, from the lowest and weakest part of the body being thus brought to press an unnatural weight upon the saddle; to say nothing of the looseness of such a position, and the consequent insecurity of the seat.

An officer who had served many years in a dragoon regiment in India informed us that the native horsemen of the enemy rode with much shorter stirrups than our cavalry, and, in consequence, although they were smaller and weaker men, they could reach much farther, and cut much more powerfully with their swords. In the use of the lance or spear, they derived a similar superiority, from the same cause. It will be asked by the unreflecting, perhaps, how it happened, then, that the cavalry in question were uniformly vanquished? Because in the approved art of war, these Eastern soldiers are universally inferior to their European opponents: their knowledge of engineering is very imperfect, nor can they act in bodies with a prospect of success against their white antagonists; in desultory warfare they are formidable, and in single combat the Indian cavalry is superior to our dragoons.

Again, if we look at the hunter, we find he uses the stirrup; for how else could he restrain the impetuosity of his fiery steed when the fox goes away? how hold him together, and prevent him labouring through mirey lanes, heavy ground, and green fallows? how put him at awkward jumps, and steady himself and his horse over them? how lift and support him when distressed? Who will be hardy enough to say that these observations will not apply strongly to military equitation? Even in riding a journey, should chafing occur (which generally arises from the stirrup being too long), if the stirrup be shortened the horseman will derive the greatest relief.

Our cavalry are taught to leap; and it might be asked, how the men contrive to avoid a tumble if their seat be so loose? In the first place, it must be recollected, that a leap in a riding school is something like a mechanical operation; and so long as the horse takes the bar fairly the balance is sufficient to keep the rider in his seat; but should the animal refuse, swerve, or take the leap awkwardly, the inefficacy of the long stirrup becomes apparent; the rider looses one or both stirrups, and is unseated, if not thrown.

The English horse is acknowledged to be the finest

animal of his tribe in the world; our cavalry are mounted upon horses immeasurably superior to those of any other country; our horses are handsomer, larger, much more powerful, and much fleetier than those of our continental neighbours. We are of opinion that similar remarks will apply to our men; yet these overwhelming advantages have never become so decidedly and so conspicuously manifest, as might have been very reasonably expected; and for no other reason than that they have been neutralized by the position in which the military horseman has been compelled to ride.—*United Service Journal*.

## AGRICULTURE.

Previously to the year 1806, when all restrictions on the corn trade between Ireland and Great Britain were abolished, the imports of corn from the former to the latter did not exceed 400,000 qrs. (Parnell on Finance, p. 66.) The imports of grain and meal, reduced to quarters, from the same country, in 1832 amounted to no less than 3,100,000 qrs.; while the yearly increasing number of horses, oxen, cows, swine—and the immense quantity of butter, barrelled beef, bacon, hams, &c., &c. give an aggregate of agricultural produce brought hither from a section of the empire almost entirely free from direct taxation, and unrated to the poor, which would alone account for the great and progressive depreciation in England of similar productions grown here. The average price of wheat in Dec. 1830, was 66s 6d; in Dec. 1831, 55s 2d; in 1833, 48s 5d; in 1834, 41s 1d: this rapid depreciation has taken place in the face of an increasing population and an absence (or nearly so) of foreign and colonial grain; for though there have been importations from Canada, and to a small extent, a fraudulent introduction of foreign corn through the Isle of Man, these are really little more than as a drop of water in the bucket, compared with the regular weekly inundations of agricultural produce from Ireland. Accordingly, we have long entertained the opinion that British farmers are not sufficiently alive to the great injury perpetrated upon them by the non-introduction of poor-laws into that country; they have petitioned with great unanimity and perseverance for the continuance of the corn-laws—for the abolition of the malt-tax—and for a commutation of tithes; while the absence of poor-laws in Ireland, a country containing at once the richest soil and the most wretched population in the world, is a subject which they seem to think or care little or nothing about; and yet it is a subject perhaps of greater importance to them than any single one of the others, great as that single one may be. There is a laboured article against Irish poor-laws in the *Edinburgh Review* of April, 1834, which we read the other day for the purpose of seeing what the ingenuity of some subtle casuist could devise to say against them; and here we must acknowledge our disappointment at seeing but the old arguments of Mr. O'Connell, which Dr. Doyle had long since triumphantly refuted, brought up afresh, and with as much confidence as if the refutation had been unwritten or unremembered. Mr. O'Connell had the audacity to avow that *his object* was to create mischief, misery, and discontent in England by driving over vast hordes of his squalid half-starved countrymen to jostle against our native labourers and work against them for under-wages. This, though a base and selfish, is at least an intelligible principle. The *Edinburgh Reviewer* objects to the introduction of poor-laws into Ireland, having pre-

viously formed for himself a revolting and fantastic theory that the establishment of any legalized provision on which the poor may rely in case of infirmity, old age, or inability to find employment, is morally and politically injurious, because it tends, they say, to dry up the sources of private benevolence among the wealthy, to sever the ties of domestic attachment among the poor, and to lead them to idleness and improvidence. The state of society in England is a standing proof of the fallacy of these allegations:—

1. Private benevolence with us is always flowing through a thousand unseen channels, fed from a thousand never-failing springs.
2. The privations which our poor are daily undergoing to prevent a separation of the members of their families is evidence of the strength of their domestic attachments.
3. Here, where poor-laws do exist, numberless societies of the working classes, formed for the support of their respective members in times of sickness, age, and distress, are also found, while in Ireland, where there is no system of poor-laws to "encourage idleness and improvidence," there is not a single society of the sort in existence! The Edinburgh Reviewer aims to be witty: "from the same lips we hear a bitter condemnation of the poor-laws in England, and an eager advocacy of their introduction into Ireland."

"Numberless have been the preparations made to alter the principle or correct the administration of poor-laws in South Britain. *Bills* have been presented to Parliament in as great abundance as by *tradesmen at Christmas*—chairmen have reported—the very short-hand writers have been run out of breath—Pitt, Whitbread, Sturges Bourne, Scarlett, and many others, have toiled for years, and find none," &c. &c. Thus, putting his principle in abeyance for a moment, in order to sport a very ill-timed pun, an inference is endeavoured to be forced upon us that, because able and wise men may not have agreed in any one entire system of poor-laws, therefore no system can be good. This comes with an exceedingly bad grace from the *Edinburgh Review*: it is nothing more than the old argument hashed up again, or rather the old taunt of the Tories which that journal has exposed a hundred times over, against Parliamentary Reform—"You, gentlemen Reformers, cannot agree upon any plan among yourselves, and where are we to find a stronger proof that it is impossible to devise one which shall not merit the contempt of all wise men?" And yet the impossibility has been overcome, and if the adopted measure of reform is not perfect, yet it has raised our national character and is daily diffusing national benefits. The administration of the old system of poor-laws in England, we all know was very bad; and the new system is not yet in full operation, but the Reviewer has wilfully violated an old and excellent maxim, "*ab abusa ad usum non valet consequentia*," and he might as well have argued against Christianity itself from the corruptions with which different sects and churches have polluted its pure, its holy, and its heavenly spirit, as against a legalized provision for the poor of Ireland in all cases of absolute and proved necessity, from the abuses which may have prevailed in the administration of such a legalized provision here. That strong part of the argument which advocates the *right* of the poor of every country to derive a maintenance by the sweat of their brow from the soil which gave them birth, as it does not strictly come within the province of this article to notice, we must reluctantly, and for the sake of brevity, forego, and confine ourselves to what more immediately belongs to it. At the same time we

do not hesitate to affirm, as an abstract principle, as a fundamental position anterior to all human law and superior to it, that the earth, being a gift from God to man, is therefore as much the common property of mankind as the atmosphere which surrounds it, and consequently that every human being born upon it has as much right to a share of its fruits, when earned by his toil, as the first-born man had to the whole of them. "If it be proved," says Dr. Doyle, "and I contend that it has been proved, that from the attributes of God, the nature of man, and the admitted principles upon which all society is founded—if it be proved from these that the poor in every civilized state should be rescued from the pressure of extreme want, it is an error against reason, it is a crime against morality, and an impiety against God to leave them to perish or to withhold from them the necessaries of life." Now, the Irish poor are thus left to perish in the land of their nativity, and in very mockery of their condition, they have often been left to perish in the midst of plenty raised by their own hands; and it is the absence, as Mr. Poulett Scrope truly says in his "Letter to the Agriculturists of the West of England," of any law compelling the landholders to keep their peasantry from starving, which enables them to exact from the latter every atom of the produce of their labour upon the soil, except the dry potatoes on which they support a miserable existence. It may be added, a very precarious existence too, for they are overtaken by a famine every three or four years from the failure of the potato crop, when sea-weed drifted from the shore, the bark of trees, nettle leaves, and every sort of garbage become the substitute for human food, and are greedily swallowed to allay the pangs of hunger. But it is untrue that "from the same lips we hear a bitter condemnation of the poor laws in England and an eager advocacy of *their introduction into Ireland*." No one ever recommended the introduction of the unamended system of English poor laws into Ireland, which is disingenuously implied in the assertion. It is a system which we demand; some system or other better adapted probably to the genius, feelings, and manners of that country, than our own amended but yet untried code would be; but a system which should remove the muzzle from the ox that treadeth out the corn, and which should make the Irish landlords relax their gripe upon their poor tenants. What has kept up the rate of agricultural wages in England to double the rate of wages in Ireland, except our poor laws, bad as they may be? The free communication and transit of labourers between these two sections of the empire, now infinitely facilitated by steam carriage, has an inevitable tendency to bring the wages of both to a level. The condition of the Irish labourer, therefore, must either be raised to a level with that of the English, or the English labourer must be lowered to the level of the Irish. In the worst of times our labourer gets his eighteen-pence a-day while the Irishman gets from 4d to 10d and the landlord pockets the difference. We pay from 6s to 9s an acre poor's-rate, while the Irish farmer pays no rate at all! That we are beaten in our own markets is the natural result, and the nation is not benefited by it. We have corn cheaper it is true; but in the long run, a nation cannot be benefited by the operation of unequal laws and by the partial exemption of one section of it from what ought to be a common burden upon the whole. If otherwise, justice is an idle and unmeaning name, no longer a virtue, but a cheat, and assuming its semblance for the purpose of betraying. Indirectly, the British farmer and the British tradesman do ac.

tually pay a poor's-rate for the Irish landlord. The hordes of hungry poor which cross the channel and land upon our shores are employed to the exclusion of our own poor, who receive parochial relief in idleness. And is this from the inability of Irish landlords to find employment for them at home? What says Dr. Doyle, who sketched a plan for the legalized relief of his countrymen when in extreme distress? "I propose to exclude from relief, except in times of extraordinary distress, those who are able to work, because I know the improvements which can instantly be commenced on the soil and navigation of Ireland would give employment to all her industrious people." We say at once, then, to our brother farmers, petition the legislature from all parts of the country for the introduction of poor-laws into Ireland, for the absence of them is an act of gross injustice to you, and has pressed more heavily upon your interests than any other single grievance whatever. It must not be admitted as an objection that agriculture has flourished in England notwithstanding the absence of poor-laws in Ireland, and therefore the want of them cannot be the cause of its depression now. The imports from Ireland have increased upon us of late years almost in a geometric ratio, and they will continue to do so while capital can be so much more advantageously invested in Irish than in English agriculture, in consequence of the exemption from that heavy rate which oppresses us, and that unequal law which shifts the Irishman's burden upon the Englishman's shoulders. But we are exceeding our due limits, and must pause.

There is no improvement in the prices of wheat and barley: the malt-trade is almost paralyzed by uncertainty as to the repeal of the duty, and brewers keep themselves aloof from the market. The month of February has been mild, with very frequent and heavy gales of wind, and a fall of more rain than we have had for many months before. Indeed the operations of ploughing and carting have been occasionally suspended by it on heavy soils; but the earth will be much better fitted to receive spring-seed than if the drought had continued without relief. We know an entire parish near us, (Hingham, Norfolk) where a week ago there was not a single well from which a pail of water could be drawn; the inhabitants were fortunate in being able to supply themselves with water from their mere. At this season of the year we may expect the markets to be scantily supplied with grain, as every farmer will be busily employed during the next two months: a slight rise in prices, as old Moore the almanac maker, would say, may therefore be expected *about this time*, rather *more or less*, according to the conjunction or opposition of the planets.

## PHRENITIS IN CATTLE.

(From the Veterinarian.)

The Frenzy or Sough in cattle is too well known to the farmer and the practitioner. There are generally at first much oppression and heaviness; the animal can scarcely be induced to move; the eyes protrude and are red; the respiration is hurried, and delirium more or less intense rapidly succeeds. The beast rushes at every thing in its way—it mischievously selects its objects—it is in incessant action, galloping about with its tail arched—staggering—falling—bellowing hideously—its skin sticking to its ribs, and the sensibility of the spine exceedingly increased. There is, even in health, a peculiar formation of the eye, or a sensibility of the retina to cer-

tain colours, which makes the beast dislike a brilliant red: under this disease it excites him to the highest pitch of fury.

If, however, the previous oppression and stupidity are much less in the ox than in the horse, so is the succeeding violence increased; not even a rabid ox is a more fearful animal; and it is somewhat difficult to distinguish between the two diseases. There will probably be some history of a previous bite belonging to the rabid ox; and in the early stage, although there may be lowness or oppression, there is nothing like apoplexy or want of consciousness. Besides, with greater fury there is more method in the madness of the rabid than the phrenitic ox. The latter will run at every thing which presents itself, but it is a sudden impulse. The former will, like the horse, plot mischief; he will endeavour to lure his victims within his reach. A much greater quantity of foam will be discharged from the mouth of the rabid than the phrenitic ox.

The causes are much the same as those of apoplexy—too stimulating food and too great redundancy of blood, to which may be added some immediately exciting cause, as hard and rapid work in sultry weather, over-driving, &c. In the neighbourhood of London too many instances of phrenitis occur from the latter cause. It once used to be the sport of brutes in human shape to excite it by selecting a beast from the herd, and driving it furiously from street to street.

The post-mortem appearances in the ox are always characteristic of the disease. The vessels of the cerebrum, the cerebellum, and the spinal chord, are highly injected—the membranes of the three are also loaded with blood. The lateral ventricles are distended with a serous fluid. The fourth stomach and the small intestines usually exhibit the most decided traces of inflammatory action. To a certain extent, however, and sometimes to a degree almost inconceivable, the whole venous system is gorged with black blood. The ox has, comparatively, more blood in him than the horse.

As to the treatment of phrenitis in cattle, there is some difficulty. Is any treatment practicable? Is human life to be hazarded? Cases will occur in which the bullet will be the best remedy; but then the flesh may be in such a congested state that it cannot be sold. If the beast can be managed or approached during a momentary remission of the symptoms, bleeding should be attempted; and if a vein can be opened, it should be suffered to bleed on as long as it will. Physic, if it can be given, will be indicated. Sometimes the beast labours under an insatiable thirst; and as his taste is not very exquisite now, he may be cheated with water in which Epsom salts have been dissolved. If there is time to get down a hornful of drink, a scruple or half a drachm of the farina of the croton nut may be administered, mixed with a little gruel. All other medicines are completely out of the question. If bleeding and physic will not save the ox, nothing will. Use should also be made of any temporary respite to confine the animal; or, if possible, to get him into some place where he cannot do much harm to himself or to any one else. Some persons have recommended setons of the black hellebore root inserted into the dewlap, and when these begin to act, they do generally act most tremendously; but the animal will have recovered, or he will be dead before the seton can have any influence. The frenzy being subdued, the next consideration is, what is to be done with the beast. No more dependance can be placed on him than on one that had recovered from a fit of apoplexy. The purging system should be continued to a mode-

rate degree; and the fever medicine given to abate the quickness of the circulation; and then, when the congested blood is got pretty well out of the system, and the vessels have got rid of their superfluous blood, and the flesh looks well, the sooner the beast is disposed of the better.

## COURT OF KING'S BENCH.

CHITTENDEN v. RICHARDS.

Mr. Serjeant SPANKIE stated the case to the Jury.—The plaintiff, Mr. Jeremiah Chittenden, is a hop-merchant, residing in the borough of Southwark, and the defendant was Mr. John Richards, the Member for Knaresborough, who is also engaged in the hop trade. In the month of June, 1834, the parties had entered into a contract, by which Richards, in consideration of the sum of one hundred guineas to be by him paid to the plaintiff, engaged to purchase from him 120 bags of hops, at the rate of 8*l.* per cwt.; defendant, however, reserving to himself the right of declining the bargain, by giving notice to that effect on or before the 12th of July. These species of contracts, it appeared, were not uncommon among hop-merchants. On defendant being applied to after the 12th of July, he had refused to purchase the hops according to his agreement, and this action was brought to recover damages for the breach of contract.

John Chittenden examined by Mr. KELLY: Was the son of the plaintiff; his father had a quantity of hops in June, 1834; the price of hops then was from 7*l.* 7*s.* to 8*l.* per cwt.; the hops were not in his father's warehouse, they were at Mr. Collett's, in the Borough.

John Collett examined: Was a hop-merchant; knew the plaintiff, who had applied to him (witness) for a loan of some money in the month of March, 1834; he advanced plaintiff 1,222*l.* 12*s.*, plaintiff leaving with him 120 bags of hops as a security; the money was to be repaid in six instalments; he had advanced about four guineas per cwt. upon them.

Cross-examined by Mr. Serjeant WILDE: It was not a bought and sold transaction, it was a loan; he was aware of the contract between Chittenden and Richards; he saw the agreement between them two days after it was dated; it was left in his (witness's) possession; the hops continued in his warehouses till the present time; no application for them was ever made by Mr. Richards; he of course expected that the money he had advanced on the hops should be repaid him before he delivered them up; could not say that he was interested in the result of this trial; of course he wanted his money.

George Denman examined: Was clerk to the preceding witness; saw Mr. Richards on the 19th of July, in consequence of instructions he had received from Mr. Collett; Chittenden did not accompany him that time; his instructions from his master were, that if Mr. Richards would sign a paper, binding himself to take the hops at four months credit, and give five per cent. discount, he was to have them. Mr. Richards refused to do so.

Cross-examined by Mr. Serjeant WILDE: Did not remember that he had told Mr. Richards that the hops were the property of his master; thought they were his master's property; would not swear that he had not told defendant so; had a faint recollection of something of the sort having been said.

Several witnesses were then examined to prove

that the price of hops had fallen considerably after the 12th of July.

Mr. Serjeant WILDE addressed the Jury for the defence. He said, the truth was, plaintiff never was in a condition to deliver the hops; they were not in his possession, he had no control over them, as they were the bona fide property of Mr. Collett, as long as the money advanced upon them remained unpaid. Defendant had no right to be forced to enter into two contracts; he had made one with the plaintiff, and by that he abided, and did not see any reason why he should be compelled to enter into a second with Mr. Collett.

The LORD CHIEF JUSTICE summed up. The only points for the Jury to consider, were very short and very simple; they were, first, whether plaintiff had ever actually had the means of delivering up the hops to the defendant; and, second, whether such tender of them had ever been made. A person who had entered into a contract with A, could not be held to be obliged to enter into a fresh contract with B, to render the former one available.

The Jury, after a deliberation of upwards of an hour and a half, returned a verdict for the defendant.

## MIDDLESEX SESSIONS, MARCH 5.

### APPEALS.—IMPORTANT TO FARMERS.

Samuel Welch, a farmer, of Walthamstow, appealed against a conviction of Thomas Halls, Esq., for passing through a turnpike-gate at Clapton, without paying toll.

Mr. BODKIN, for the respondents, who are the contractors for the roads, said the only question the Court had to determine was the construction of the 32 sect. c. 126, of the Act 3 George IV., commonly called the General Turnpike Act. The short facts of the case were, the appellant, a farmer, claimed exemption from toll for hay, the produce of his own land, not intended for sale; this was admitted, but he also claimed a right to return toll-free with his cart loaded with manure. The words of the act, after naming a variety of articles exempt from toll, were "only once in the same day." He, therefore, contended that as the appellant's cart had carried one of the articles exempt in the morning, on its return loaded with another article it was liable to toll.

The CHAIRMAN—But both articles are exempted from toll under the act.

Mr. BODKIN—Yes, but the difference is that they were both carried in one cart on the same day, which was contrary to the terms of the act.

Mr. CLARKSON, for the appellant, argued that if a man sent out two carts on the same day, one empty and the other loaded, the empty one might return loaded, and the loaded one empty, and both would be exempt from toll. It would be an injustice so to construe the act as to prevent the poor man who had but one cart, from the exercise of the same privilege with his richer neighbour. The act was intended for the benefit of the agriculturist, but this would be a gross perversion of its meaning.

After a lengthened discussion the Court divided, when there appeared for confirming the conviction three, and against it two. Conviction confirmed.

### THE DECISION REVERSED.

RAPHEAL, APPELLANT—HALLS, RESPONDENT.

This was an appeal by Lewis Raphael, the bro-

ther of the Sheriff of London, against a conviction in a case where the question was precisely the same as last.

Several other magistrates having entered the Court, the Counsel on both sides agreed to leave the question to be stated by the Chairman.

The CHAIRMAN, after stating the facts to his brother magistrates, said he regretted that a difference of opinion existed between that Court on a former occasion, and the magistrates below, Mr. Halls, of Bow-street, having continued to convict after the Court had decided the question by quashing a conviction of precisely the same nature; the Court, however, had just come to a different conclusion on the second appeal, a third was now before them, and the question was still open for discussion.

Mr. LAURIE said, that having read the clause in question, he was of opinion that the Court were bound to construe it in its most liberal meaning for the benefit of the agriculturist. (*Hear, hear.*)

After some further discussion the Court again divided, when there appeared for the appellant nine votes, and for the respondent three; and the conviction was ACCORDINGLY QUASHED.

Mr. Welch, the former appellant, then applied to the Court, and said that he thought himself hardly dealt with; he was a poor man, and the penalty would defray the toll for twenty years.

Mr. BODKIN, on the part of the respondents, consented to abandon their half of the penalty and costs.

### MALT DUTY.

#### A RETURN OF THE NUMBER OF PROSECUTIONS UNDER THE MALT LAWS IN EACH OF THE THREE KINGDOMS, IN EACH OF THE LAST FOUR YEARS.

Excise Office, London, March 7, 1835.

#### A RETURN OF THE TOTAL NUMBER OF, AND EXPENSES OF THE OFFICERS EMPLOYED IN THE COLLECTION OF THE MALT DUTY, AND OF THE TOTAL AMOUNT OF SAVING WHICH COULD BE EFFECTED IN THE EVENT OF THE REPEAL OF THAT DUTY.

No separate return of the number and expenses of the officers employed in the collection of the malt duty can be given, as the surveys are so arranged as to comprehend the charging of duty under several heads; and with regard to the possible saving to be effected in the event of the repeal of the malt duty, no estimate on this subject can be relied on as altogether correct.

In order, however, to comply with the terms of the order as closely as possible, an estimate has been attempted; and supposing that the survey on brewers (which is continued as a protection to the malt duty) were at the same time wholly abandoned, the repeal of the malt duty *might possibly* admit of the discontinuance of

107 Supervisors, at £200...£ 21,400

1,250 Officers, at £100..... 125,000

—£146,400

by enlarging the remaining districts and rides, making a saving in salaries of 146,000*l* per annum; but as the increased size of the remaining districts, &c., would necessarily very largely increase the expenses of the supervisors, some corresponding extra allowance would be called for, which would go to diminish the amount of saving obtained from the discontinuance of salaries.

It is to be observed, that the immediate saving would not amount to the above sum, as an allowance of half-pay to the officers dropped must be granted to them until they could be absorbed into the other branches of the service, as vacancies occur.

The half-pay would amount to..... £73,200

G. A. COTTRELL, First Gen. Acct.  
Excise Office, March 7, 1835.

CONSUMPTION. — A young lady in the last stages of consumption was lately restored to her health by the following extraordinary and accidental remedy:—She had long been attended by the faculty, but derived no benefit from their prescriptions, and considered herself verging to the end of her existence, when she retired during the summer to a vale in the country, with the intention to wait in solitude the hour of her approaching dissolution. While in that situation, it was her custom to rise as early as her malady would permit, and contemplate the beauties of nature and the wonderful works of God from her chamber window, from which she observed a dog belonging to the house, with scarcely any flesh on his bones, constantly go and lick the dew off a camomile bed in the garden; in doing which the animal was noticed to alter in appearance, to recover strength and, finally, to look plump and well. The singularity of the circumstance was impressed strongly on the lady's mind, and induced her to try what effect might be produced from following the dog's example. She accordingly procured the dew from the same bed of camomile, drank a small quantity each morning, and after continuing it some time experienced some relief; her appetite became regular, and she found a return of spirits, and in the end was completely cured.

DAYS OF GRACE.—Different customs prevail in different countries with regard to the grace allowed on notes. In the United States three days are allowed; in London, three days; Turin, five; Amsterdam, six; Copenhagen, eight; Paris, ten; Hamburg, twelve; Madrid, fourteen; and Geneva, thirty; while in St. Petersburg, Leghorn, Lyons, Leipsic, and some other cities, no days of grace are allowed.

NEW POOR LAW BILL.—The advantages of the poor law amendment act have been strongly exemplified at Brighton, where a very considerable saving has been effected in the expenditure of the parish funds, while the poor are also in a better state. The sum collected for the relief of the poor in 1832 was 28,323*l* 13*s*; in 1834 it amounted to no more than 15,829*l* 9*s* 8*d*, leaving a saving of 12,494*l* 3*s* 4*d* per annum.

## RETROSPECT OF THE WOOLLEN TRADE.

The activity which our markets began to experience shortly after the commencement of the new year has suffered but little fluctuation since, but continues to prevail at the present moment with every prospect of permanency. The character of this activity is not less gratifying than its degree, since it appears to spring from a demand not for purposes of speculation, but real and effective, having the supply for actual consumption as its immediate object. Hence we do not find that goods accumulate at any point of their transition, but that they move forward from hand to hand with a readiness which causes the like animation to be felt along the entire line of operations connecting manufacturer with consumer. The accounts from London represent that woollens are almost the only branch of manufactures in a state of briskness there, and the stocks of wool in that market are said to have been reduced more than half within the last month. This state of things indicates the rapid progress which has been made towards the restoration of confidence since prices became moderate and steady, but as it is one which offers no inducement for speculative adventure, we must be prepared for the uneasiness of individuals who find their occupation gone, and are therefore anxious to promote another change which may enable them to resume it: we need not be surprised if a stray lamentation should here and there be vented that amidst all this seeming prosperity there is yet "no improvement in prices." Of the sort of improvement sought we need not doubt. Advance is meant. Nor need we look far back for an example of its effect. We improved wonderfully in the last six months of 1833, and we were at the point of perfection just twelve months ago, when our trade, unfortunately, came to a complete stand-still. It was very perverse of the trade so to do. Dr. Sangrado's patients were equally perverse when they chose to die just at the critical moment when the drinking of another gallon of water and the loss of another pint of blood would have cured them—Our "improvement in price" Doctors practice the bleeding system also, and sometimes, it must be admitted, with tolerable advantage—to themselves—but as to the water-drinking part of the process, they leave it to Mr. Livesey—of Preston.

As little need we be surprised at the questionable shape in which these lamentations will sometimes insinuate themselves upon our attention. A person who has an interested purpose to serve at all risks will not be very scrupulous in his employment of means. Let one of this class but get himself placed "squat, like a toad," at the ear of some well-chosen purveyor of public information, and it is odds, as Lord Brougham would say, that he finds him ready moulded to suit his purposes upon public credulity. Such persons there are in existence to whom the support of a theory is the "vindication of a principle," and who recognise in a state of advancing prices a state of perfect optimism under which all is for the best. In what shape the squatter might start up if we could have him "touched lightly" with the spear of another Ithuriel—whether in that of a manufacturer or a wool dealer, is more than we will venture to speculate upon. We will say, however, that if ever there was a time when the trade of this district was in a sound and healthy state, that time is the present. The clothiers sell their goods as fast as they produce them, and obtain satisfactory remunera-

tion for their outlay and labour; but what is all this to the high price optimist? He turns his face to the wall, and will not be comforted; how should he, since there is "no improvement in prices?"

From official accounts which have just been published of comparative imports and exports in the years 1833 and 1834, we extract the following view:—

|                                                                 | Years ending 5th Jan.         |
|-----------------------------------------------------------------|-------------------------------|
|                                                                 | 1834. 1835.                   |
| Quantity of foreign wool imported into the United Kingdom . . . | lbs. 88,046,087 .. 46,455,422 |
| Do. retained for home consumption                               | lbs. 39,153,463 .. 41,113,448 |
| Duty paid on foreign wool . . .                                 | £ 138,280 .. 131,685          |
| Foreign and Colonial wool exported,                             | lbs. 442,696 .. 807,362       |
| English wool exported, declared value . . .                     | £ 332,504 .. 191,979          |
| Woollen goods exported, ditto . . .                             | £ 6,540,636 .. 5,975,657      |

It will be seen from this statement that the imports of foreign wool last year exceeded those of the preceding year by nearly eight and a half millions of pounds weight, and it will be recollected, at the same time, that the quantity imported was more by one-half in 1833 than in 1832, so that, comparing the latter year with 1834, we have an augmented import, in two years, of about twenty millions of pounds upon about twenty-six millions! Let those who like to speculate on a scarcity of foreign wool for the supply of our manufacturers take this fact along with them.

We cannot exactly account for the apparent discrepancy between the quantity of wool imported and the amount of duty paid thereon last year. The prices of wool for the greater part of last year were too high to allow us to suppose that a larger proportion than usual would come in at the  $\frac{3}{4}$ d per lb. duty; and at the 1d. per lb duty the 6,595*l.* diminution of amount, would represent a quantity of 1,582,800 lbs.; so that if we take the rate of duty to have been proportionately the same in the two years, this quantity must be added to the excess of import in 1834 to find the quantity warehoused in bond on the 5th January last, and the total stock so warehoused must in such case have been about ten millions of pounds weight. We cannot imagine this to be the proper way of explaining the difference, and are yet unable to account for it otherwise, unless, indeed, we assume that the importations from our colonies, duty free, have been so much augmented as not only to account for the general excess, but also to compensate for a deficiency from other parts; and, after all, this may be the true solution. It will, however, be seen that the quantity retained for home consumption in 1834 exceeded that of 1833 by about two million pounds only, so that the excess of import being eight millions and a half, we have, at all events, about six and a half millions of that excess unappropriated, and this part of the statement being lbs. against lbs., we apprehend there can be no mistake. The quantity of foreign and colonial wool exported is too unimportant to affect the comparison materially.

The next point which claims our notice in this statement, is the comparative value of English wool exported in the year 1834, which appears to have been little more than half of that of 1833.

The trade in English wool is an enigma somewhat difficult of solution. Whilst foreign wools, in the course of the last nine months, have fallen so considerably, and accommodated themselves so completely to the general state of trade in manufactured goods, English wools have remained, and still remain, at most extravagant prices. Foreign wools at 3*s.* per lb. have fallen to 2*s.*,

whilst English wools at 2s. have scarcely fallen at all, and it has been usual to ascribe this effect mainly to the demand which exists for foreign supply. Now, we have often stated, and we do not hesitate to repeat what we have stated, that of the produce of the last clip, not more than one-half the usual proportion has been worked up in this country up to the present period. It appears also that little more than one-half the usual quantity has been exported during the past year. What, then, has become of the surplus? In the emphatic language of penny-a-lineism, we pause for a reply. In the meantime we may express an opinion, which we believe is becoming very rife amongst the consumers of English wools, that some great and sudden depression in the article is inevitable. Foreign wools are now employed extensively to purposes for which English wools used formerly to enjoy a monopoly. Considerable stocks must be in existence somewhere, and the longer they are allowed to accumulate, the greater must be their ultimate pressure upon the market. We should not be at all surprised if, in the course of the next three years, the prices of English wools fall to little more than one-half what they are at this present moment.

Let it not be supposed that we speak of a contingency which has never before been realised. In 1825, the famous, or the infamous bubble year, a certain sort of English wool, which three years before had stood at 10*l.* per pack, reached 18*l.* and ruined most of the purchasers at such price. In 1829 it fell again to about its former level. That same sort, however, during the past year rose to 26*l.* per pack, and 18*l.* are yet asked for it at this moment. Are we then unreasonable in surmising that, under existing circumstances, it may again fall to 10*l.*? That state of excitement which is intermittent with the mercantile community, each successive fitful change occupying but a short interval, becomes a chronic disorder when it once attacks the English wool-grower; he hears from afar, in his rural retreat, that an advance in prices has taken place, but he is unacquainted with the evanescent nature of the circumstances which have produced that advance, and probably by the very time that he acquires his knowledge those circumstances have ceased to operate. The opening of foreign markets, consequent upon the peace in 1814, brought in a mass of competition against him, but still he remained obstinate, and in the years 1832 and 1833 wools were brought to market the accumulated produce of fifteen to twenty years, half of it rotten and almost valueless. Such is the consequence of inattention to the signs of the times, and such result we must expect again, unless the English wool-growers open their eyes to what is passing about them.

We leave one item in the official account without remark for the present. It connects itself with the subject of our foreign trade upon which we have already promised to offer our views, but we are again constrained to postpone them to a future opportunity.

Upon looking more minutely into the public accounts of imports and exports for the last two years, we discover no evidence of a more positive nature as to the proportion which the actual consumption of foreign wools, during the past year, has borne to the supply of it. At the same time further points of comparison offer themselves which may assist us in forming an approximate opinion.

In the first place, however, we find that the exact decrease in the quantity of foreign wool upon which duty was paid last year, was 2,628,101 lbs. as compared with 1833. As to the quantity stated to have been entered for home consumption, we have no longer any doubt that it means the quantity of foreign wool upon which duty has been paid, added to the total import of Colonial wool which pays no duty, and the increase upon both together being 1,959,985 lbs., whilst the decrease upon the former alone is 2,628,101 lbs., it follows that the increase of Colonial wools admitted in 1834 is equal to the sum of these two quantities, namely 4,588,086 lbs. The account of foreign wool imported, we find, embraces the quantity upon which duty has been paid, the quantity bonded, and the whole import of Colonial wool duty free: hence the general increase in 1834 being 8,409,335 lbs., if we deduct from that quantity the increase upon Colonial wool alone, as above, we shall find the increase of foreign wool, subject to duty, to be 3,821,249 lbs. What portion of this extra supply may have been actually consumed we have no means of determining; nor can we judge of it in any other way than by reference to the general state of our manufacturing operations in 1834, on comparison with that of 1833. Such comparison would lead us to conclude that the general consumption must have fallen off, but it must be borne in mind that Colonial wools have been substituted for English wools, by the worsted spinners, to an extent which may have taken off a portion of this augmented supply. Yet this, after all, is mere matter of conjecture.

The stock of foreign wool bonded in London, for payment of duty, is stated to have been, on the 5th January last, 4,623,689 lbs. What stocks may have existed in bond at the out ports we are not informed, and the private stocks upon which duty has been paid, of course appear in the public accounts in augmentation of the quantity entered for consumption. The excess of import over apparent consumption is no guide, or limit, to the quantity in bond, because the bonded stocks held the year previously are not included in that excess, but have been accounted for in the importations of 1833.

APPLE TREES IN COTTAGE GARDENS.—It often happens that one or more trees can be trained against a cottage wall or roof, or against some wall appertaining to a cottage; in these cases the proper sorts are the Ribston pippin, the old Nonpareil, and, if a large kitchen apple be required, the Bedfordshire Foundling. In situations liable to spring frosts, which so often kill the blossoms of the generality of apples, the Court pendu plat is recommendable, as its blossoms expand very late in the season. Under less favourable circumstances, where the Ribston pippin may not succeed, the Bedfordshire Foundling will be a harder substitute, or the King of the pippins, which is still harder; the Northern Greening may be planted for late kitchen use. For an autumn kitchen apple, perhaps none, in this case, is more to be recommended than the Keswick Codling. The Hawthornden comes into an abundant bearing state at an early age; and, were it not liable to die off in some soils, it might be preferred to the preceding. A wet soil, and a cold bleak situation, are what the cottager has the greatest difficulty in contending with, a poor soil he can enrich. In some instances it may be possible for him to remedy a wet soil by drainage; but in other cases he may find this beyond his means. He should, how-

ever, take care to plant the tree very shallow, or even place it entirely on the dug surface, and then cover the roots with the best mould he can collect. This he should afterwards keep mulched if the weather becomes very dry; but otherwise he should only keep the soil slightly stirred occasionally by a fork; or if this cannot be done without injuring the roots merely hoeing it will be better. In short, every thing should be attended to that will encourage the roots to run near the surface; the latter should, therefore, be trod upon as little as possible. Rotten manure should be applied; even leaves could be collected and applied in a state approaching to vegetable mould.—*Gardener's Mag.* January.

## THE MALT TAX.

FROM THE SUSSEX ADVERTISER.

SIR,—Mr. Blackman in his letter to you, inserted in your last Journal, has totally refrained from touching on the subject of the *main benefit* which the English Farmer will receive by the total abolition of this tax;—let him consider that—

|                                                                                                                                                                                                                                                                                                             |         |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|
| A farm of 200 acres (rent 100 <i>l</i> per annum) requires, or has imposed on it, with the farmer, about four men per day all the year round, (365 days in a year, 52 Sundays) 333 days, which at one quart of beer per day per man, (at 6 <i>d</i> . per quart, the beer-shop price,) gives per annum..... | £33 6 0 |
| For the harvest month, an addition of ten men will give, at one gallon each....                                                                                                                                                                                                                             | 28 0 0  |
|                                                                                                                                                                                                                                                                                                             | £61 6 0 |

There were farms thus situated in this kingdom, and though the statement as applicable to the whole kingdom is an over charge, perhaps doubly charged—be it so—there will be then left full £15 per cent. on the rental by the removal of this odious tax as a benefit to the English farmer, besides the £3 per cent. increase by the increased demand for barley.

The English farmer now produces wheat for the public at 1½*d*. per lb., and yet has to pay 6*d*. for a quart of beer; this is far from honest towards

AGRICOLA.

DEVILS PREFERRED TO SANITS. — (From an old M S.)—A farmer rented a grange haunted by fairies for a great rent, which hee paid every haife yeare. One asking him how he durst be so bold to live in that place, and whether hee saw none? “Noe,” saith the farmer, “there bee two saints in heaven trouble me more than all the divells in hell, namely, St. Mary and St. Michael, which bee my rent days.”

There is scarcely a profession, trade, or occupation of any kind, in which the intense use of the eye does not produce an early weakening of that most important organ. To all, the failure of sight is a lamentable deprivation—to some, utter ruin. Every one who holds prevention to be better than cure, and who, from his peculiar avocations, is under the necessity of pressing upon the eyesight, should use Grimstone's Eye Snuff. There never has yet been discovered a remedy so uniformly efficacious in affections of the eyes.

## TO THE EDITOR OF THE “MARK LANE EXPRESS.”

Sir,—I observe in your Paper of the 2nd. Instant a letter respecting the duty on Malt, commencing as follows—

“Lest the fallacious arguments of “A Constant Reader” in your last, should bias any one, I will state the case at issue.” Your correspondent then goes on to state that the consumption of Malt is 32 millions of bushels, and the duty 2*s* 7*d* per bushel, and concludes by asserting that by the repeal of the Malt duty, the Public would save 9,600,000*l* in the price of Malt and Beer!!!

Without farther preface, I will proceed to show the gross ignorance displayed by your correspondent, and how little reliance the public can place upon such statements.

In the first place then, your correspondent does not seem to know how many bushels form a quarter; he assumes four, now no one need be told that a quarter consists of 8 bushels. He next proceeds to show the expense of manufacturing at 4*s* per quarter, interest on capital, labour, &c., and retailing 4*s* per quarter, and lastly, extra cost from restrictions on the trade, licences &c. 4*s* per quarter, all of which are much exaggerated, and sums up with stating the expense of collecting the duty at 8*s* per quarter, being nearly two-fifths of the whole duty.

A very few remarks on your correspondent's calculations, will in the present instance be sufficient to show that the public only pay for their malt and beer, the amount of the malt tax, more, than they would do, provided the duty was repealed.

Assuming then, that if thirty-two millions of bushels of malt consumed is correct, the amount of duty at 2*s* 7*d* per bushel can only be 4,133,000*l* odd; not 8,000,000*l* as your correspondent has it. In the next place he sets down 1,600,000*l* as the expense of manufacturing, being at the rate of 4*s* per quarter, or 6*d* per bushel. Now observe this should be exactly one-half, or 800,000*l*. He falls into the same error with his charge for “Interest on capital, labour, (what labour?) and in retailing,” another 800,000*l* over-stated. And lastly he says “extra cost from restrictions on trade, licences &c.” 4*s* per quarter; now this really is the best joke of the whole; what branch of the Excise department can restrictions impose an increase of cost above the duty of 20 per cent? Not malt—and for 4*l* 10*s* of licence duty, which is the highest rate, you may make thousands and thousands of quarters. I now come to the cost of collection, which your correspondent states at 6*d* per bushel, or 4*s* per quarter, a very formidable sum, 3,200,000*l*. and more than the whole expense of collecting the gross Revenue of the United Kingdom. I here state, and I do so without fear of contradiction, that the malt tax is the easiest and the least expensive item of the Revenue, in its survey and collection, and cannot possibly exceed 1*d* per bushel. Therefore how it is possible for the public to save above nine millions, by the repeal of four millions, is more than I can comprehend. But it will not be difficult to show, that the public cannot receive any benefit at all from the repeal of this tax.

Suppose that Government should repeal the malt tax, either with a view towards the relief of the agricultural interest, or to benefit the public, they will do so from necessity not choice; because they see plainly that the demand for barley at present is very great, and that foreign barley can, and is now imported, and brought into consumption at the present

rate of duty with advantage; and unless that rate of duty was raised, any increased demand can do our agriculturists no good. On the other hand they have very strong and powerful reasons, for resisting the repeal of the malt tax; and not the least is the immorality consequent upon placing an intoxicating liquor, so much in the power of the lower orders. But even allowing no bad consequences should arise from this, would not the increased demand for barley, cause a larger quantity of land to be put under that crop? and this of course to the exclusion of other kinds of grain, perhaps Wheat?—and would not this system have the effect of raising the value of the latter? And where would be the advantage to the labourer if he got his pot of beer a farthing cheaper, (not more) and paid a penny more for his loaf? This certainly would be supporting the agriculturist with a vengeance. Is the public aware that this is the true cause of exactions making for the repeal of the malt tax? and is it not at their expense, that relief is sought by the agriculturists? It is. A cheap loaf is far preferable to cheap beer any day.

Let Government stand firmly to the continuance of the malt duty. It is perhaps from the ease and certainty with which it is collected, the fittest subject of taxation in existence. It presses hard on no one, and no substitute can possibly be found less objectionable.

I am, Sir,

Your most Obedient,  
ANTI-CHANDOS.

### SALE OF CORN BY WEIGHT.

Limerick Chamber of Commerce,  
10th February, 1835.

At a General Meeting of the Body held, to take into consideration the necessity of applying to Parliament for an alteration in the present mode of selling Grain by measure in London.

“Resolved:—That an alteration in the mode of selling Grain of all kinds in the London market, from the system of measure, to weight, is absolutely necessary for the safety and security of the trade—exposed, as it is at present, to mistakes or fraud in shipments, to embezzlement on the voyage, or to fraud or inefficacy in the metage in London; and that this Body take such steps, through their Directory, by petition and correspondence as may tend to a Legislative Enactment for the above-named system.”

### PETITION.

To the Right Hon. and Hon. the Commons of Great Britain and Ireland in Parliament assembled,

The Petition of the Chamber of Commerce of Limerick,

Most respectfully sheweth:

That your Petitioners beg leave to address your Honourable House, and to represent the great injury which they, in common with the Corn Trade of Ireland in general, sustain, in consequence of the system established in the London markets, of selling all species of Grain, and discharging all such cargoes by measure instead of weight, which latter mode is now adopted in all the great Ports of England and Scotland.

That this system exposes your Petitioners to the liability of constant frauds on the part of Masters of Vessels, who, receiving their cargoes by weight, and delivering them by measure, are thus rendered wholly irresponsible for the quantity discharged.

They have thus the opportunity, if so disposed, of abstracting, without detection, from the cargo during the voyage, and the shippers are thus deprived of all remedy for the recovery of the deficiency. This system also renders your Petitioners wholly dependent on the skillfulness or negligence of the parties who may be employed to discharge the cargoes—thus proving that the system of measuring Corn is a most fallacious and indefinite standard of quantity.

That your Petitioners beg to state, that it is not their wish to interfere in any way with the Revenues of the Corporation or Meters: on the contrary, they are willing to pay for weighing, a charge equivalent to that now enacted for measure: their sole object being to change a system which exposes them to constant frauds, and deprives them of all check in the disposal of their property.

Your Petitioners, therefore, humbly pray, that your Honourable House will be pleased to institute such inquiry into the subject as may lead to some alteration in a system so injurious to the Corn Trade of Ireland in general.

Your Petitioners will pray, &c.

### PHRENTIS IN SHEEP.

(From the Veterinarian.)

In the sheep the symptoms are the same—the eyes bright and prominent—the flanks heaving—the animal in constant motion; he cocks his tail and gallops about the field, and attacks his companions, or the shepherd, or even a post or tree that may chance to attract his attention.

LAMBS.—In lambs the symptoms are sometimes very curious—they leap and jump about, and exhibit the most ridiculous antics. Mr. John Lawrence says that “on the borders of Suffolk several scores of lambs were seized with an uncommon malady, leaping and jumping about the fold-yard in a strange manner; and a dunghill being raised to a level with the eaves of a low-tiled barn, a number of the lambs ran skipping up to the top of the roof, as though they had been possessed by more devils than Mary Magdalene, or even the nuns of London. The whole parish wisely concluded that they were bewitched, and a wretched and aged pauper became the object of their suspicion and deadly hatred. The senseless and infernal supposed prevention of witchcraft was resorted to, namely, burning one of the poor animals alive.”

CAUSES AND TREATMENT.—These bear so close an analogy to what I have described in cattle, that I will not detain you by a repetition of them.

The dog is comparatively exempt from phrenitis. I never saw a case of what I could satisfy myself was pure phrenitis in this animal. These exemptions are singular; and, as veterinary science progresses, will be a subject of interesting inquiry.

AUTHORITY OF THE SPEAKER.—There is an instance on record of the exercise of authority by a Speaker of the House of Commons, which we should suppose without a parallel:—It is related of Sir Edward Seymour, when he was Speaker in 1672, that his coach breaking down at Charing Cross, he ordered the beadle to stop the next gentleman's they met, and bring it to him. The gentleman in it was much surprised to be turned out of his own coach, but Sir Edward told him it was more proper for him to walk in the streets than the Speaker of the House of Commons, and left him to do so without further apology.

## REMARKS ON THE RECENT FAILURE OF THE POTATO CROP.

(From the Quarterly Journal of Agriculture.)

As a corroborative proof of what our correspondent A. A. stated as a cause of failure in the potato crop, arising from the action of the dung on the cut sets, he informs us that a piece of ground had been planted with a variety of white potato, and another piece with a variety of purple potato. Both pieces of ground were dunged for the crop, and both kinds of potatoes were cut into sets, and planted on the dung, without regard to whether the skinny or cut aside was placed next the dung. The white variety sprung very well, but the purple proved very defective. Some purple cut sets were planted on a piece of ground *without any dung*; these all sprung very well. Without the occurrence of this latter circumstance, the difference in the springing of the white and purple kinds might be reasonably ascribed to a difference in the state of the sets, the purple kind might have been injured whilst the white was not; but when we see the former springing quite well without dung, it is obvious no previous injury had been sustained by the sets, and that it was the dung which had proved injurious to their vegetation. Again, those purple sets which had sprung were found to be placed with the skinny side next the dung, and those which had not sprung, with the cut side next the dung; whereas, the purple sets which had been planted without dung all sprung, whether their skinny or cut faces were placed uppermost or downmost. These circumstances again press upon our attention the injurious agency of the dung.

In what manner the action of the dung affects the vegetation of the sets is not very evident, for if the dung had undergone any fermentation in the earth, which it probably did, and that fermentation had destroyed the vegetation of the purple sets whose cut faces were placed near the dung, it ought, in like manner, to have destroyed the vegetation of the white sets which were placed with the cut faces next the dung; and yet they all escaped unscathed. The failure of the purple sets on the dung would at first countenance the conclusion, that the exposure of the internal substance of the potato to the dung, renders it susceptible of being injured by the dung; while, on the other hand, the success of the white sets tends as much to prove that no injury had arisen from the dung. These are conflicting testimonies. In this dilemma, conjecture even cannot supply us with a satisfactory reason; for, were we to suppose that the act of cutting the two varieties of potatoes into sets might have injured the one kind and not the other, the supposition would not be in accordance with fact, for the purple sets sprung without dung as well as the white sets with dung. Still, we have this alternative left upon which to hazard a conjecture:—the two varieties of the potato might differ in their constitutional condition; the white kind might be in a more vigorous state of health than the purple, and therefore more capable of resisting outward affections. We have seen that the white withstood the excitement of dung when the purple did not, for that it was that excitement which had destroyed the vegetative powers of the purple sets, by being placed in a certain position,

there can be no doubt, because part of them sprung very well without dung.

That some varieties of the potato may be in a state of constitutional decay, is not improbable. It is scarcely possible for the multifarious varieties of potatoes which exist to escape injury in the very various soils and situations in which they are cultivated throughout the country, regardless of their nature, although it is evident that some soils and situations must be more congenial to their nature than others. The following instance, related by Mr. B. H. Hickey in the Irish Farmer's and Gardener's Magazine for January 1835, shows one among the many ways in which the potato may be affected, and all such affections are probably superinduced by constitutional weakness. "A gentleman who holds a farm of 150 acres, planted in the usual manner 34 acres under potatoes, in the year 1832; the result was a complete failure and total loss of the crop. This induced him to try many experiments upon the root, all of which failed except the following, which exceeded his most sanguine expectations:—He took six potatoes, and divided them into twenty cuts, he then got a large basin of water, into which he put a cupful of salt water and a piece of bluestone about the size of a walnut. He put ten of the cuts into the basin, and let them remain there one entire night. On the ten cuts which were not immersed in the basin he could distinctly perceive, by a very strong microscope, many small white particles like eggs; and those cuts which were immersed presented no such appearance whatsoever. This discovery urged him to follow up the examination attentively, and every day, for a short period, he continued to watch the appearance of the aforesaid matter. The result was, that those white globular particles were animalcule, for in a few days they became quite visible to the naked eye in the form of little worms or maggots. The cuts that had been steeped never showed the slightest appearance of any such thing, and they retained their solidity and firmness when the other ten cuts were completely decayed and rotted. Still unwilling to believe, without further proof, he tried the experiment five or six times, and planted them, distinctly marking a division between those cuts which were steeped and those that were not. The consequence was, the almost total failure of the one kind and the complete success of the other, placed the question beyond the possibility of a doubt."

The curl is, we conceive, another disease probably arising from constitutional derangement; and there may be many others to which the attention of the cultivator has not yet been directed. There is apparently no other way of explaining the certain partial failure of the ash-leaved kidney potato when cut into sets and planted for years in the same garden. A change of seed will not insure success, but planting whole potatoes always will.

Of late we have had favourable opportunities of becoming acquainted with the opinions of many cultivators and experimenters on the cause or causes of the recent failures in the potato crop. The general tendency of the whole of these opinions is to ascribe the failure to some injury which the sets or tubers had received. No doubt the want of plants originate from a lifeless state of the cut sets. But this fact is apparent to every body, it requires no ghost to tell us that the non-appearance of the plants above the ground is a consequence of a *bad* state of the sets; but how did the sets become bad? "['There's the rub.'"] Some say the injury to them arises from heating the crop in the pits after having been taken up in

\* In the Autumn of 1833, 200 ewes were fed on these meadows, and when killed were all found to be quite sound.

autumn; from heating the sets after having been cut; from planting the crop during dry warm weather; from using unfermented dung; from over-ripening the seed; from not allowing the seed to ripen enough; from planting the crop too late; and from taking up the crop too early. This enumeration of opposite causes of failure shows on what questionable grounds some of the opinions on the subject are founded. Heated sets will no doubt not spring, but how they can become heated under the same process of storing and cutting, which has prevailed for years past before failures were even suspected, it is not easy to see. If lateness of planting and earliness of taking up be causes, how happens it that failures such as the present did not exist in Ireland before these few years, where potatoes are planting and taking up all the year round? Bad crops of potatoes have frequently occurred in Ireland as well as in this country, but they have occurred from a destruction of the crop after it had appeared above the ground, as in many parts of the west coast, from rain and high winds. In some places in Ireland potatoes are planted as late, and take up as early, as August, and in others they are taken up during winter as they are required. If over-ripening the potato be a fault, there is always a remedy in every potato end, and the best end too for seed, which is never over-ripe. There is one circumstance in which all experimenters are agreed, that potatoes planted whole never fail to spring. This is one important fact. It proves that the astringent principle of the skin of the potato can resist injuries, whatever be their origin, much better than the internal pulp.

Now, it may be asked, after all this argumentation, what does it end in? We answer, nothing; literally nothing. We pretend not to explain the various phenomena connected with the failures of the potato-crop. But we are anxious to state it as our opinion, that the culture of the potato is as good and judicious now as it ever was when no failure occurred. If it is necessary to change that culture, it must be from a change in the nature of the potato. It is not improbable that *it has* changed. It is not improbable that successive cultivation from tubers may have altered the constitution of the potato, especially when we consider that the plant can also be cultivated from the seed. We should like to know, whether, in the same district of the country, failures have been observed most in those kinds of potatoes which have been longest in cultivation. We should like to know whether the new varieties which have been cultivated in fields have always grown. We know that several new varieties have sprung without failure in experiments on a small scale. Should the results of these inquiries prove, that only the old varieties have failed, and that new varieties have always succeeded, we may naturally conclude in that case, that the old varieties have degenerated, and either that nothing but the substitution of new varieties, or a total change in cultivation, can in future ensure full crops of the potato.

**LARGE CYPRESS TREE.**—Mr. Exter, in 1827, measured a cypress-tree in the churchyard of Santa Maria de Tesla, two leagues and half west of Oaxaca, whose trunk was 127 English feet in circumference, and 120 feet in height. It appeared in the prime of its growth, and had not a single dead branch.

All plants, whether in the garden, field, or forest, if in rows, should be placed in the direction of north and south, in order to admit the sun's rays every day equally to both sides of the row.—*Gardeners' Mag.*

## THE MALT TAX.

Sir,—Being one amongst the many thousands who believe that the repeal of the malt tax would afford more relief to the distress of agriculture than any other measure that can now be proposed, I confess myself amongst the number of those who (upon reading the debate which has recently taken place in the House of Commons) felt the greatest disappointment, mortification, and disgust.

No honest man can be otherwise than disgusted at that total want of principle which so many members exhibited, who had made their way into Parliament (some entirely, and others in a very great degree) by their advocacy of the repeal of this most unequal and oppressive tax, but who, upon the very first opportunity, instead of supporting the repeal, are found voting its continuance, thereby insulting their suffering constituents, and violating the most solemn promises, made, as it now appears, only to be broken upon the very first opportunity. Surely confidence in public men never received before such a deadly blow as this: and unless these men have sold themselves to the advocates of annual parliaments, I am at a loss to know upon what ground their justification can be placed;—it cannot be upon the speech of Sir R. Peel, masterly as it was, for although he exhausted every argument that could be brought against the repeal, he stated no single fact that was not as well known at the time of the elections, when those promises were made, as at the present moment. But, Sir, I will now leave these impostors to their constituents and their own consciences.

Although I am ready to admit the ability with which the Chancellor of the Exchequer treated the subject, I am decidedly of opinion he is either misinformed, or has misrepresented the most material point on which the strongest part of his argument rested—viz. the quantity of barley brought into charge from the 10th October, 1834, to 19th February, 1835, which he stated to exceed, by 846,000 bushels, the quantity charged in the corresponding months of the preceding year; and upon this supposed fact, he founds an assertion that the barley crop of 1834 could not be a deficient one; this appeared to every one acquainted with the real state of the crop to be impossible, unless a larger quantity of foreign barley than the return shewed had found its way into the market. But, admitting the quantity of malt stated by the Chancellor of the Exchequer to be correct, is he a stranger to the fact, that wheat has entered largely and generally into the maltster's cisterns this year, *not singly* by itself, but mixed with barley, so as to render it impossible for the excisemen to tell the proportion, the duty being the same, the quantity alone concerned him, and the trade alone can say what quantity has been used. I have the authority of some of the most practical men in this county for stating it at one-fifth, and for saying in that proportion it has been used by them to great advantage. Believing this practice to have been general, and knowing it has been used by some in larger quantities, what becomes of Sir Robert Peel's argument, founded on the quantity of malt made as a proof of the quantity of barley grown last year?

Equally fallacious is he when quoting the highest price of malting barley in Mark-lane, and taking that price as a test for the average price realized by the grower; every one knows it cannot hold a comparison, and that in the last season in many situations not half the average quantity was grown, and also when the falling off was the greatest the quality was the worst.

Equally fallacious is he also when he asserts that the *tastes* of the labouring classes are changed, so as to induce them to prefer tea to beer. Is it possible any man in his senses can believe this? Let any practical man say if the contrary is not invariably the case, and that the use of tea is forced upon him from his inability to obtain beer. Is it not a lamentable fact that many a poor man is out all day with only a piece of bread, and, instead of carrying with him the little stone bottle of home-brewed beer, which I am old enough to remember in use, his only means now of moistening that meal which his crust affords is a draught of water, and that perhaps drawn from a ditch. Surely, then, it is no wonder that at night, when he returns to his family, he substitutes a little of what is called tea, but what is in reality little else than warm water, and which then to him is certainly preferable to cold. This you may depend upon it is the reason why, in cold weather it is taken by the labouring man, as I have often heard it refused by him in summer, when he would jocularly describe it as water got damaged. I do not wish to say anything to inflame the passions of that unfortunate class of whom I am speaking, and will therefore suppress a description which I could easily give, but content myself with asking if enough of that quiet, industrious, and peaceable conduct which formerly so much distinguished the agricultural labourer, still remains, sufficient to keep him by his own hearth, sharing the beverage called tea with his wife and family, and in silence, although not contentment, brooding over his altered circumstances, witnessing at the same time his former employer, and the employer perhaps of his father and grandfather, reduced to a level with himself. I ask, in such a case as this, would it not be worth while to restore such men, if it can be done, to the use of their long lost beverage, home-brewed beer? Surely the amount of the malt tax ought not to stand in the way of such an object.

Equally ill-timed and cruel was it for Sir Robert to tell the growers of barley that, from the low price of wheat, the clay soils equally needed relief—who denies it? or who doubts but the alteration of the currency, and the operation of his own bill, are the causes of their distress in common with our own? What else have brought wheat to 4s 6d per bushel? What else has it been which has annihilated so large a proportion of the agricultural capital, and reduced thousands of honest, industrious, and deserving men, with their wives and families, to ruin and beggary?

Are we now to be told that the present race of occupiers are required, and expected, to take example by their predecessors, and silently submit to the sacrifice of the remaining part of their capital at the "*shrine of public credit*," and that as long as the produce of the land can be made to obtain as much of the present currency as will pay the public creditor the sum previous administrations had agreed to pay him, in one of a different description, so long we must continue to cultivate the soil, and, like slaves and vassals, hand over as it were our produce, further to enrich the only class in this country who have not already sustained their share of the loss which the holding either of land or merchandize necessarily entailed upon every one who was exposed to the operation of Mr. Peel's bill. What property, whether real or personal, but has been depreciated from thirty-five to fifty per cent. except the fundholder's? His property forms the exception, and up to this moment has been wonderfully improved. I envy

not his good fortune, and have not the most distant wish to do him an injury: and I have good reason for knowing that many fundholders consider that gross injustice has been done the landed interest, and that a continuation of that injustice is more likely than any thing else to endanger the stability of the public securities of this country, which danger must always be proportionate to the ruin and distress which are brought upon the rural districts.

I will here also forbear to describe what I am thoroughly convinced must be the finish of the large nominal wealth of this country, if some timely concession is not made to that which always has been considered the true basis of a nation's wealth, agriculture.

I sincerely wish I could flatter myself that even-handed justice might soon be expected by us; no one would more sincerely rejoice at this than myself—and as no one will now deny the distressed state of the agriculturist, whether on clay soils or light barley lands, so no one, I assure you, can be more convinced of the danger of longer delaying the application of a remedy of some sort to our present situation, than I am that the repeal of the malt tax would prove of all other measures the most effectual.

I remain, Sir,

Your most obedient servant,

ROBERT LEAMON.

Whitwell, 17th March, 1835.

**LARGE HORNS.**—The horns of cattle, of the Cape in general, are very large, being equal in size to those of the Abyssinian ox. I have frequently seen them a yard in length, and six or seven inches in diameter at the base: they are said to be capable of holding four or five gallons of water, and even to contain a bushel of corn, but I never tried the experiment. At all events, they might well be considered there as the veritable cornucopia.

But the horns of the cattle at the Cape are by no means so extraordinary as the tails of the sheep. Every one has heard of the immense tails of the Cape sheep, but the formation of them is not so well known. They consist of a mass of very nice, sweet fat, which is exceedingly useful for domestic purposes, and consequently is much prized by the Dutch. This mass varies in its weight from eight to even twenty-five pounds, but the average is about ten. The sheep are the *laticauda*, or broad-tailed kind.—*Voyage of the Chanticleer.*

**ANECDOTE OF A PARISIAN GIRL.**—AN HISTORICAL FACT.—In 1813, voluntary subscriptions were raised for the support of Napoleon's army. The poor of France subscribed their mite, and have been known to part with any property they might possess to contribute; indeed, so great was their attachment, that a poor girl (who could not afford a trifle out of the produce of her industry) gave vent to her patriotic feelings, by parting with a most luxuriant head of hair. The barber, who gave two dollars for the hair, told her he had some of ROWLAND'S MACASSAR OIL, and like other patriots, presented her with a bottle; which restored her hair so rapidly, that in a few months she was enabled to sell it again, to subscribe to the second levy. The tale reached the ear of Napoleon, who gave her a pension of 500 francs a year, and an inclosure of 10 dollars, to purchase some more of Rowland's Macassar Oil.—Curiosity induced the Monarch to try the Oil himself; and he often told the anecdote when confined at St. Helena.

## A LETTER TO SIR ROBERT PEEL.

(FROM COBBETT'S REGISTER.)

You first began by stating the amount of the tax, the gross proceeds of which, for 1834, you stated at five millions one hundred and fifty thousand pounds; and the net payments into the Exchequer at four millions six hundred and seventy thousand pounds. Here then the cost of collecting this tax is four hundred and eighty thousand pounds a-year; and yet you twisted the thing about, one way and the other way, till you came to an assertion, unsupported by any fact, that the collection of the tax costs only a hundred and fifty thousand pounds a-year. An honest Committee of the House of Commons would bring proof upon the table, that the malt tax costs five-sixths of the expenses of the whole of the excise.

Your next assertion was, that if the malt tax were taken off it would cause the price of beer to be only a half-penny a pot cheaper than it now is. This monstrous assertion you copied from the *Times* Newspaper. It is as clear as figures can make it that malt would be at the same price that barley would be, bushel for bushel, even if made by a maltster for sale; because eight bushels of barley make nine bushels of malt, and the increase of bulk amply pays for the expenses of the malting. Now then, when barley is from twenty-five to thirty shillings a quarter, but fix it at thirty, malt to the domestic consumer is nine shillings a bushel. So that, supposing that the repeal of the malt tax would leave all the malt to be made by maltsters for sale, a quarter of malt would cost me thirty shillings instead of the seventy-two shillings that it must now cost me; and yet you tell us that it would reduce my beer in price only a halfpenny a pot. You seem to think that all beer is to be made for sale, even after the repeal of the malt tax; but did you make the "pledge-breakers" believe, that even the public brewers (who we will suppose now to sell beer on an average at four-pence per pot) would take off only an eighth part of the price, when the malt should cost less than half the sum that it costs now? This would hardly be believed by "pledge-breakers," and certainly not be pretended to be believed by any other of God's creatures.

You said, sir, that you did not think that malt could be made cheaper than maltsters now make it. You really appear not to have been able to understand any part of this subject. You talk of a competition between the poor man and the maltster in the making of malt. Why, sir, neither the poor man nor the farmer would make malt to sell. They would make it to use; and it would cost them more to go five or six miles to a malthouse to fetch malt enough for their use, than it would to make the malt at home. In towns it would be made by maltsters, as it formerly was; but, as it formerly was, it would be made without any other charge than the increase of the bulk. You seem to imagine, that farmers and labourers would not make their own malt if they were permitted to do it. All the farmers, and more than half the country labourers, would make their own malt; and every one of them can do it if he will. Every one of my labourers in Hampshire who lived in my houses (they were all situated in, or near to woods) made his own malt and brewed his own beer. I saw them drinking water, and I told them that no water-drinker should live under a roof of mine. They remonstrated a little, talked of the high price of malt (then I believe thirty-six shil-

lings a quarter duty;) I answered, there is the barley which you grow yourselves; get it when you like, at so much a bushel; and the short and the long of the matter is, if I come to your house on such a day and do not find you with a good barrel of beer, out of that house you go as soon as you can make it convenient. They all had barrels of beer in a very short time; and I never asked one of them what were the means he made use of to make his malt; but make it they did, and good jovial lives they led. I hope that great numbers of them make their malt now, especially in the woody parts of Hampshire and Sussex. It is, therefore, ridiculous to talk of men in the country still going to a malthouse.

The same error you adopt with regard to the brewing. You seem to think that all the beer that is brewed is to be sold; and you say that a poor man cannot compete (as you call it) with the great brewer, who makes such quantities, and who has so much capital. Poor fellow, he does not want to compete with him (if it must be compete). To "compete" with the big brewer he must have a druggist's shop in his house. He wants nothing but the strength of the malt, worked into water, fermented, and put into his barrel. He does not want to know any thing about "Corythris Indicus," "essence of tobacco," "salt," "devil's dung," and all the other infernal ingredients, that have been proved to have been put into the horrible stuff called beer and porter. He wants simply the malt soaked in water, of a heat which he very well understands, then the liquor boiled in his kettle, and then the liquor put into his tub; and when it has seen a Sunday he is very sure that it will not poison him. You have the notion, borrowed from your predecessor, that so much strength cannot be got out of a bushel of malt, as can be got out of each bushel of a thousand bushels, if brewed all in a mass; and that therefore the farmer or labourer cannot "compete" (as you call it) with the big brewer. This argument, "if carried out," as they say of the Reform Bill, would send all the victuals of a parish to be cooked in one pot. Sir, your way of life, the places where you have been all your life-time, your taste, your great acquirements of a totally different kind, have absolutely disqualified you for treating on a subject like this. A bushel of malt contains a certain quantity of sugar, or sweet matter, which, being drawn out into water, and afterwards fermented, becomes beer. Now the whole of this saccharine matter can be got out of a bushel of malt, or of a gallon of malt, as completely as it can be got out of a hundred bushels, when put together for the purpose. In short it can all be got out; and no one can have more than all out; and I have drunk as good beer as I ever wished to drink when the brewing has been of a peck of malt; and as to the expense of brewing, the rule always was, that the grains paid for the fuel and the labour. But in a labouring man's house there is, in fact, no cost at all. The wife is the brewer, and there is this great additional advantage that good and fresh yeast (an absolute necessary of life) used always to be had in plenty in every neighbourhood. Whereas now, even the baking work has to stand still till the hawker of yeast comes round from the big brewery.

You had my Lord Althorpe's argument, that the habits of the people had changed; that they now like the East and West India slops better than beer. Those slops are the ruin of their wives and families in great part; but if they have lost their love of beer, how comes it that they so crowd to

the beer-shops? I have often reminded even the House of Commons, of the memorable evidence of Mr. Ellman, who told a committee of the House of Commons, in 1821, that, forty-five years before that, when he became a farmer, every labourer in the parish of Glynde, where he lived, brewed his own beer, and drank it by his own fire-side; and that then, in the year 1821, not a man in the parish brewed his own beer, except two, to whom he gave the malt. Forty-five years back would have brought him to 1776. Now, sir, I beg to observe, and I beg my Lord Althorp, and those who cheered you, to observe, that at that time, there was no malt tax, if made by persons for their own consumption. The tax on malt made for sale was not above ninepence or a shilling a bushel; but on malt made by the parties for their own consumption, there was no tax at all. Of course, every man in the country made his own malt; and that was the reason why they all brewed their own beer in Mr. Ellman's parish, as it was in every other parish in England. In the year 1783, this permission ceased (seven years after Mr. Ellman began to be a farmer;) from that time to this, the tea-slops, the potatoe food, the rags, the feebleness, the beggary and misery, and recklessness of character have been coming on; till at last, they have made it certain, that either the system must be changed, or this whole frame of government be destroyed.

It is not that the taste and the habits of the people have changed; it is that they have been compelled, by acts of the parliament, to abandon their good habits: it is not that they ever preferred nasty troublesome expensive tea-slops, and the washy roots, that give the body half the smell of a corpse: it is not that they have ever preferred this, but that they have been driven to it by acts of the parliament. The wretched, half-naked creatures get trust for a quarter of an ounce of tea, and two ounces of sugar, not having the means of getting the malt, and very seldom of getting meat; and you contend, that the parliament had not only a right to reduce them to this state, but to keep them in this state. Give them, at least, the liberty that their fathers had, forty years ago; give them leave to make malt for their own consumption, and not to sell or barter; give the poor man, or the farmer, leave to make his drink out of his own little plot, or out of his field of barley, the produce of his own toil. You talk, often enough, of ancient liberties, and laws, usages, and constitution, all of which your party express themselves devoted to conserve. Permit us to go back, then, to the laws of fifty-two years ago. Permit us to be as free as our fathers were, and we will not complain; but, unless you will do this, talk to us not of Conservatives, and especially of Conservatives who break their pledges to prevent us from going back that fifty-two years.

Mr. Handley having spoken of the advantages of spearing barley and then drying it in order to fat cattle, and having said that two bushels of speared barley were equal, in fattening cattle, to three bushels not speared, you expressed your great doubts as to the fact; and you should not have done this without knowing anything at all of the matter. Perhaps there is nothing more surprising than the great change produced in the fattening powers of barley, by the process of malting, by which process it becomes quite another thing than what it was before. You will, however, have no doubt of the greatness of this change, when you know that beer cannot be made of barley. Take a bushel of barley, pour water upon it as if

it were malt, crack it first, as you do malt; then brew with it, as if it were malt; treat it exactly as you treat malt; and you will find come from your barrel, flat, tasteless, nasty, shiny stuff, that you will not endure in your mouth for a moment. Take the same, or a similar bushel of barley; make from it seven gallons of beer; a quart of that beer will set you to sleep, if not lay you under the table; and, if kept two years, would burn in the fire like brandy. There is, then, a very surprising effect produced by the process of malting. The late Mr. Baverstock, of Alton, to the knowledge of many persons who knew him, and who are now living, extracted forty-five pounds of sugar from a bushel of malt. Mr. Timothy Brown, who was also a brewer and a maltster, breakfasted with him along with me, when he sweetened our coffee with this extract, which was of about the sweetness of coarse moist West India sugar. Brown, who had made similar experiments himself many times, told us that he had never got more than forty-two pounds from a bushel of malt. Thousands upon thousands of persons can, I dare say, bear testimony to the extracting of quantities of sugar, in somewhat a similar proportion. Now, sir, take a bushel of barley and grind it into flour or meal, give it to a hog, horse, or ox; and you will find that even three bushels will not lay on the quantity of flesh that will be laid on by these forty pounds of sugar; and I would venture my life upon the issue, that a bushel of malt ground into meal, will lay twice as much flesh upon any animal as a bushel of barley ground into meal. I was not back from the North soon enough to try this experiment upon two hogs; and I have no means of weighing the hogs alive; but if I live till next fall, I will try the experiment fairly; at any rate, the effect of malting is prodigious, as to the capacity of barley for creating meat. And, sir, this tax is a positive prohibition to our availing ourselves of this immense source of national wealth. The case is simply this: here is my field of barley, restrained as I am by the malt tax, it will fat only ten hogs of a certain size; take away the tax, and it will fat twenty hogs of the same size. If this be the fact, is not this the most horrible law that ever was heard of in the world?

With regard to the mode of using barley, as mentioned by Mr. Handley, it is this: you steep the barley as if for malting; and then you lay it upon the floor in greater or less thickness, according to the weather; you turn it now and then until the roots come out, and until it is in that state in which it ought to go upon the kiln to be dried. In this state you give it to the cattle without kiln-drying; and Mr. Handley said, that in this state two bushels were equal to those of unspeared barley, which I can readily believe, because I have known many farmers do it, in order to bring up their horses when they have been low in flesh. But the excise has been so severe; the terror so great; the ruin so terrible, that men have been afraid even to do this; and if to have the barley in his granary; to know how he might use it so as to revive his horses; and not to dare so to use it lest he should be ruined, and die in a jail: if this be not slavery—real infamous slavery—let a broken-pledged "Conservative," or the devil himself, come and tell us what slavery is.

After all, however, your statements in contradiction to me were of no effect. They all sunk out of sight when you came to your closing argument, which was this: that, if the malt tax were repealed, there must be a property tax; that is to say, that if the tax were taken off the industrious

classes, it must be paid by the landholders and the fundowners ! This was your great pledge-cracking argument. Mr. Hume showed that there need be no property-tax ; that to make the stamp taxes fair and impartial ; to make the aristocracy pay on their estates what the tradesman and the farmer and the artizan are compelled to pay ; that this alone would yield a revenue equal to the amount of the malt tax. Ah ! but this was worse and worse ; for here was the aristocracy to pay again ; and the Duke of Sutherland was to pay upon his estate in proportion to what farmers, tradesmen, and artizans, pay on their property ! This was the devil all over ; this was the very thing to be avoided. Mr. Hume pointed out the pension-list, and the salary-list. Still worse, if possible ! Monstrous, to take away the pensions of gentlemen and ladies ! "What, destroy the monarchy !"

Sir, the discussion and decision on the malt tax, including the Conservative pledge-breaking, and the most cordial support that you got from the Whigs ; these have done prodigious good. Better in the end that the Marquis of Chandos should have failed. Had you yielded you would have swamped the Whigs ; but you must have kept on yielding ; and the two factions would not have been exposed as they now are ; they are now coupled together in their hatred of the people, who enjoy the sport of seeing them worry and tear each other to pieces.

#### SOME ACCOUNT OF THE MODE OF FATTENING CALVES IN THE NEIGHBOURHOOD OF LONDON.—

By Mr. MAIN, Chelsea.

(From the *Quarterly Journal of Agriculture*.)

The paper written by Mr. Aiton of Hamilton, on the fattening of calves in Strathaven, published in Vol. V. p. 249, of this Journal, like every thing else which falls from that gentleman's pen, is calculated to do much good, especially in the north of England and Scotland, where that branch of rural economy is but little practised, and but little understood. As fattening calves forms a distinct and profitable part of the farmer's business in the neighbourhood of London, it has occurred to me that a statement of the English practice might not be unacceptable to some readers, who may have opportunities of engaging in this very natural and ancient practice of fattening calves.

Mr. Aiton has said very truly, that local circumstances must determine the grazier or farmer whether he shall turn the milk of his cows into butter or cheese, into pork, bacon, or veal. For the last mentioned purpose he must be near a good market, where there is a constant demand for butcher-meat of this description. If at too great a distance, the expense of carriage (because fat calves cannot, at least should not be driven) deducts too much from the profit, and is often otherwise inconvenient. So much does the circumstance of distance from market govern the trade, that the whole country round London is divided into *zones*, in each of which the different businesses of milking, calf and house-lamb fattening, butter making, cheese and pork fattening, are carried on. Milking, for the supply of the metropolis, is carried on within a circuit of six or eight miles from the city, either by cowkeepers in the vicinity, who have establishments similar, though on a smaller scale, to that of the late Mr. Harley of Glasgow, or by far-

mers, who send the milk in large upright tin cans by spring-vans to the retailers in town. Beyond, and surrounding this circle, lies the veal and lamb suckling country, extending from ten to thirty miles. Still farther off is the fresh butter district, extending to the distance of seventy or fourscore miles from London, numerous heavy broad-wheeled waggons being employed to bring up the butter and other provisions weekly, and load back with goods of all descriptions.

Every farmer in the suckling district, keeping from six to a dozen cows, or more, makes veal of all his milk. By proper management of his cows, and by selling off barreners, and buying in incalvers, he always contrives to have a flow of milk, to the quantity of which the number of calves are apportioned. The byres or cow-houses are single or double ; if the former, the building is wide enough to admit a rank of calf-pens being fitted up behind the cows. If it be a double cow-house, the pens occupy the centre from end to end between the stalls or standings for the cows.

The calf-pens are boarded inclosures, but no larger than will just allow the calf to turn within ; the sides and partitions are four feet high, the floor boarded and pierced with holes, and raised at least one foot above the earthen floor of the inclosure, for the purpose of keeping the pen dry and clean, as much depends on cleanliness, and frequent changes of clean wheat straw for the calf to lie on. There is a little box or manger in every pen, in which is kept a lump, or some pounded chalk for the calf to lick. This is supposed to counteract the tendency to inward fever, which suckled calves are often subject to.

Every cow is made to suckle her own calf three times a-day, for the first three or four days after calving, and afterwards constantly twice a-day. If she has a very full stock of milk, another calf about the same age is also put to her, in order that her udder may be perfectly emptied at each milking. Her own calf must, however, always have its full, and not be robbed by the other. If a calf goes on thriving and well, it will be what is esteemed in England *prime veal* in about ten weeks, and will, at the end of that time, weigh from seventeen to twenty stones of 8lb. each, and will fetch at Smithfield market from 4s 6d to 5s 6d per stone, according as veal is more or less plentiful.

It is not the largest or heaviest calves that fetch the most money ; one of fourteen or fifteen stones, if of the proper age, and as complete as to fatness as possible, will sell for a shilling or two per stone more than a calf weighing between twenty and thirty stones. Notwithstanding this well known fact, some farmers are of opinion, that as a calf grows and fattens faster after it is ten weeks old than before, and also requires less milk to keep it improving, there is really more clear profit made from a calf of twenty-five stones, than from two of fifteen stones each. There is only the prime cost of one, say they, and one commission for selling ; whereas there is in the other case two first costs and two commissions to be deducted from the gross amount. This is a question not yet settled even in suckling districts, for there we see men of equal penetration and experience following different practices.

Farmers living at the distance of from fifteen to thirty miles from London send their fatted calves to market by a salesman, who keeps horses and covered spring-vans for the purpose. Each salesman has a track of country which he frequents, and where he is well known. His van calls twice a-week at the farm-houses on his route to market,

to take up the fatted stock. This is sold in London early on the morning of the next day. In the evening he repasses homeward, leaving the amount of sales at each of his employers, enclosed in a printed market-bill, with the name of the purchaser, and the amount as stated by the clerk of the market, to whom the money is in the first place paid. The salesman's commission for carrying and selling a calf from a distance of twenty miles is 5s, and one shilling additional for every pound sterling above 5l the calf may fetch.

The veal sucklers are supplied with calves by another class of men called calf-dealers, who travel in carts built for the purpose into the dairying counties, and buy up all the young calves to be disposed of. These are brought up by hundreds every week into the suckling districts, and sell at prices varying from 20s to 35s per head, according to their age, size, or breed. The London cowkeepers also sell all their calves as soon as dropped; these are carried to Smithfield, and bought by another class of calf-dealers, who carry and dispose of them in the country.

The whiteness as well as the firmness of veal constitute its principal value when dressed. Some breeds have whiter fleshed calves than others, and they are most valued by butchers, who judge of the colour of the flesh by looking at the inside of the mouth and white of the eyes. The butchers also bleed the calves repeatedly before they are slaughtered.

The profit of fattening calves may be judged of by an example in figures, which I have often experienced. A calf is suckled for ten weeks, and weighs from eighteen to twenty stones, sinking the offal, as it is called about London. The calf fetches 5l at market, from which, deducting 30s, which it might have been sold for when a week old, and 5s salesman's commission, leaves a profit of 3l 5s, or 6s 6d per week for the cow's milk. Now, deducting 2s 6d per week for the keep of the cow, the bare profit left is only 4s per week. But it must be remembered, that a good cow will fatten off two calves, while she is in milk; some I have had, two and a half; but this can be but rarely accounted on. Still, taking one cow with another kept for the purpose of suckling, her annual returns will be nearly what it is commonly estimated at, namely, 12l.

To ensure this, or any other sum as clear profit, depends entirely on the attention bestowed on the cows and calves. Some cows are odd-tempered, letting down their milk only to their own calves, and withholding it from those they are made to foster. This, if not corrected, will injure both cow and calf; the one will be starved, and the other will soon become dry.

One of the greatest rarities about a calf-fattening farmer's house is a drop of cream, or even milk for the owner's tea! The cow-man is constantly enjoined to forward the calves as fast as possible; and though it be his duty to strip every teat after the calves are satisfied, still but very little comes to the tea-table, if the number of calves be duly proportioned to the stock of milk.

The remedies for ailing calves are nearly the same in England as Mr. Aiton advises to be administered in Scotland.

The reporter of the county of Middlesex was nearly right in saying, that the farmers' wives and daughters know nothing of dairying; the fact is, they have no dairying to look to; but, had the same reporter been lucky enough to have witnessed the frugality and constant toil of a farmer's wife in the dairy countries, in the Vale of Aylesbury for

instance, he would have seen examples of incessant care and thrift in dairy management, as may be equalled, but certainly not surpassed, by any housewives on the face of the earth.

### "THE CHRISTIAN FAMILY'S ASSISTANT."

By the REV. HENRY LINDSEY POPPEWELL.

*Bennett, London.*

This work displays great diligence in the author, and alike does credit to his talents and his heart. It has reached a fifth edition, which alone would suffice to prove that it has experienced no small portion of public favour. Independent of its inestimable value to those whose habits are such as to incline them, and whose avocations are such as to permit the adoption of family prayer daily, great advantage will be derived from an attentive perusal of those parts in which reference is made to the ordinary duties of life. The following is an extract from a chapter upon the duties of masters and servants:—

"We have no right to expect every virtue from our servants. Those who seek perfection, should themselves exhibit it; this is the least that can be required of men enjoying all the advantages of truth and education, if it is to be demanded of those who unfortunately want both the one and the other. Our expectations ought to be brought within a reasonable limit; and we should make allowance for foibles, of which we are not ourselves unconscious. To be a good master, a man should be well acquainted with human nature, as well as with religious principles, that he may know what to expect and what to forgive."

### FOR THE SUSSEX ADVERTISER.

Sir,—On the hustings at the County election I ventured to give an opinion that the repeal of the whole of the Malt Tax would not operate as a general relief to agriculture. Before I proceed to submit to you the reasons for that opinion, permit me to lay aside, for the present, a few of the important questions connected with this subject, so as to avoid embarrassing the main question of relief. First, then, I pass over the question of half the duty. I should think very meanly of any ministers who could propose such a measure, except as some relief of taxation generally, and in that case there are other taxes to be taken in preference. 2ndly, I pass over the question of a substitute for the tax. If I were arguing it financially, I must see my way a great deal clearer than I now do, before I would consent to part with this tax, or any part of it. 3rdly, I pass over the moral effect of the repeal on the habits of the poor. I wish as well to them as any man, but so far as the question of relief goes, it applies only to its effect on their wages. Lastly, I pass over the general interest of the consumer in the repeal of any tax which applies to us all, though not to all equally, and the destructive effect which it appears to me the repeal of this whole tax would have on the particular property of the maltsters and brewers, to say nothing of its effects on the revenue derived from tea. And now having cleared the ground of these collateral questions I come to the question of general relief to agriculture. By the word agriculture, I mean a present and general relief to all descriptions of the actual farmers of the land. The interest of the farmer appears to me to be the primary and essential interest to be considered at this moment. The interests of the landlord and

of the labourer seem to me to be only secondary and derivative interests. There can be no principle of British policy sounder nor more important, than to preserve a race of cultivators who furnish their own capital, and to take care that that capital shall not be improperly drawn upon either by the State, the Church, the Parish, the Landlord, or the Labourer. Well then, how is the repeal of the Malt Tax to relieve the farmer? It is, say the repealers, by creating a greater demand for barley, which will increase the growth and price of barley, and thereby indirectly increase the price of hops, wheat, oats, beans, peas, beef, mutton, and Irish pork, and the difference of price between what those articles produce now, and what they will produce after the repeal, will pass into the pocket of the farmers. To be sure there is not much faith to be placed in political arithmetic, for a man may always choose his own figures, but I will endeavour to deal with them as sincerely as I can. Then let us suppose that the price of Malt is 64s. per quarter, or 8s. per bushel, of which 34s. is the price of the barley, 20s. 8d. is the duty, and 9s. 4d. the maltster's profit. If the duty be repealed, the 20s. 8d. and nearly half the maltsters' profit must be deducted from the price of the malt, and the price of the malt would then consist merely of the price of the barley, and the maltster's profit. Now the quantity malted in the United Kingdom in the year ending 10th of October, 1833, was 5,029,599 quarters of barley, including, I presume, the distilleries: but of the quantity not malted, and which was cracked or ground as food for man, bullocks, pigs, and poultry, of course we have no account. But one of the great complaints of the repealers is, that even in this very year serious injury has arisen, not only to this county, but the whole kingdom, in consequence of the excise regulations not permitting inferior barley to be malted. Now it would be well for those gentlemen who are so fond of the word protection, to ask themselves whether these excise regulations do not operate as a protection on the higher qualities of barley, and, of course, increase their price, and whether a free trade in the inferior sorts of barley for malting, although it might raise the price of such qualities, might not *pro tanto* reduce the price of the superior qualities, and whether, if the whole quantity should not be considerably increased by the new demand, the price of the whole, instead of being raised, might not be eventually reduced? At any rate it is pretty clear that the relief to the barley grower, would only come out of the difference of the profit between the price of the inferior barley consumed as food for cattle, and the price to be paid for malting, and the relief to the general agriculturist, from the additional quantity of food required as a substitute for the inferior barley. Now if the pigs of England are deprived of their inferior barley, the pigs of Ireland may rise in price, or the inferior but improving barley of Ireland may be sent to supersede the lower English barley, and the repeal of the Malt Tax may tend to raise the rents of an Irish landlord, instead of the profits of an English tenant. The excise regulations now operate to prevent the importation of Irish barley for malting, and it does not seem very easy to see how the growers of 51, 52 and 53lb. barley are to be relieved by the exhibition of 47, 48, and 49 barley, in the malt market. But let us suppose that the consumption of malt should be increased a fifth, or 20 per cent. in the whole United Kingdom, or in other words, that a million of quarters of barley more must be found, requiring, perhaps, 250,000 acres of land in the three

kingdoms, about equal to a quarter of Sussex, to supply the place of the inferior barley, or other food now used for cattle, the question still remains, to what extent, if any, the price of barley would be raised, and whether the difference of price would go into the pockets of the farmer? It is pretty certain that the price of malt would fall about 24s. per quarter, viz. the duty, and about half the maltster's profit. Is it equally certain that the average price of barley, allowing for the effect of inferior qualities being malted, would rise 3s. per quarter. If it rose at all, would it be felt as a relief even to the barley grower, at the end of three years? and who will undertake to put a value on the amount of relief to be derived by other classes of farmers? Can I believe that the repeal of a 20s. 8d. duty, which operates now as a protection to superior barleys, would leave 25 per cent. of its amount, equal to 5s. 3d. per quarter as an increased price on all barleys, and that such increased price would find its way to the farmer's pocket? If then my supposition be at all correct, that the average price of barley would not be affected above 3s per quarter, I can, at any rate, calculate my own relief as a farmer. I grow about 50 quarters of barley, on about 10 acres of land, making a relief of 7l. 10s, and if I grow 20 loads of wheat, valued when the rent was set at 14l. per load, and I sell my wheat at the present price of 10l. per load, I lose 80l., and get 7l. 10s. This appears to me about the value of the repeal of the Malt Tax. Will it on a Down Farm of 500l. per annum, give a relief in its best view, equal to a reduction of 10 per cent. on the rent? I sincerely think not; and even if a million or more quarters should be wanted, I can see no reason at all why the relief should not pass, if it passes at all, which to me appears very disputable, to Irish oats, and Irish pigs, and Irish landlords, rather than to the English farmer.

I remain, Sir,

Your obedient Servant,

Lewes,

HENRY BLACKMAN.

**CATTLE AND SHEEP IN GREAT BRITAIN.**—It is proved, by the returns of 1831, that the agricultural labour performed by oxen and horses in England and Ireland is equal to 22,500,000 effective men! The number of sheep is estimated at about 32,000,000. The value of this immense stock amounts to a very large sum, and the accidents to which they are subject are very numerous. In the Spring, neat cattle and sheep are extremely liable to become hoven from eating too greedily of clover or other green food, and unless relief be speedily afforded, death takes place. Mr. Read has, with a degree of industry which claims the gratitude of the farmer, devoted his attention to this subject, and perfected an instrument, by the early use of which, instantaneous relief is given. Upon the testimony of many eminent practical agriculturists, we with perfect confidence recommend it to those who may not be acquainted with its efficacy.

**IMPRISONMENT FOR DEBT.**—By the return to the House of Commons, in 1833, of persons imprisoned for debt in England and Wales in 1832, it appears that

So that three-fourths of the whole were too poor to provide themselves with bread!—By the 4th report of the Common Law Commissioners, dated March 1, 1832, it appears that of persons in execution for debt in 1831, more than 25 per cent. of that number were for debts under 20l., and more than 45 per cent. were under 30l.

## TO THE EDITOR OF THE LINCOLN-SHIRE CHRONICLE.

Sir,—As Parliament is about to meet, and the state of agriculture must very shortly become the subject of its deliberations, every man interested in the result ought to use some effort in promoting measures for ameliorating the condition of the farmer.

Much may and must be done by landlords, but encumbered as many estates are with mortgages, settlements, &c., it is impossible for the farmer to receive adequate relief unless assisted by the government. British agriculture is ruined, unless some legislative enactment be made for its benefit. Two measures appear obviously calculated for this end: the establishment of poor laws in Ireland, and the repeal of the malt tax. The first will benefit us by enabling the poor of Ireland to consume a greater proportion of their produce at home, which now glut the English market, and is the main cause of our present ruinously low prices; in this object, I fear, we must expect no assistance from our new Conservative member for Lindsey. I was concerned to hear the honourable gentleman declare on the day of his nomination at Lincoln, that he could not support a proposition of this kind, because, he thought, poor laws could not be administered in Ireland by reason of the absence of a middle order of society there, which was necessary for their proper administration. I have a better opinion of the honourable gentleman than to suppose him capable of viewing with complacency the horrid state of destitution and misery in which the lower orders of Ireland are involved; producing as a natural consequence, feelings, which would show themselves in open rebellion against the government which neglects to provide a remedy, unless those feelings were repressed by the presence of British soldiers. Let there be a law to enforce a provision for the aged and infirm by a charge on the owners of property, not on the miserable tenant, who is often removed in a very trifling degree from the wretched pauper, under the iron sway of absentee proprietors; let the tenant be authorised to claim the amount paid by him for poor-rates as a deduction from his rent; let a paid officer be appointed in each parish, or in a small district of parishes, to execute the office of overseer. No minister has ever proposed such a measure as this, because it would decrease the incomes of absentee landlords, and they are almost unanimously opposed to it; the government, therefore, in proposing such a scheme, must be prepared to encounter the united opposition of the Irish members in parliament. Mr. O'Connell's opposition to poor laws in Ireland speaks to my mind much in their favour; the trade of agitator, to him so profitable, would in a great measure cease; the immense military force might be reduced; the national expenses decreased, and taxation diminished. This leads me to the next head—repeal of the malt tax. The apathy of the farmers, who were not unanimous in petitioning for redress of grievances, was the cause of nothing being done for them during the last session of the last parliament. Lord Althorp acknowledged that he was induced to propose the repeal of the house tax, because the tax was shown to be generally unpopular by the numerous petitions from towns, particularly from London against it. Here we see the importance of unanimity and zeal in petitioning: a tax, which pressed heavily on none, not effecting even indirectly the only interest in the country which was declared in the

King's speech a few weeks before to be suffering, is remitted, and that suffering interest is left entirely without redress. The remission of the malt tax would be beneficial to all classes. The repeal of this tax would advance the price of barley less than it would reduce the price of malt—both effects would follow: thus, every working man in agriculture, manufactures, or commerce, could obtain a wholesome and proper beverage at a cheaper rate. Beer would supersede the use of spirits, and would become the universal beverage of the poor; a new impulse would be given to agriculture; land, which is now cultivated for wheat, would be sown with barley, and we might hope to see, not war prices (we do not desire them) but fair remunerating prices, agricultural labourers in full employment, and a spirit of contentment, loyalty, and attachment to the laws amongst our rural population.

Yours, &c.

A NORTH LINCOLNSHIRE FARMER.

Feb. 16, 1835.

The trade in eggs, the value of which for export, according to Mr. Williams, now (1832) amounts to 500*l* a-day, paid by England to Ireland, is carried on with considerable vivacity at Lanesborough (county of Roscommon), and also at Tarmonbarry. The eggs are collected from the cottages for several miles around by runners, commonly boys from nine years old and upwards, each of whom has a regular beat, which he goes over daily, bearing back the produce of his toil carefully stowed in a small hand basket. I have frequently met these boys on their rounds; and the caution necessary for bringing in their brittle ware with safety seemed to have communicated an air of business and steadiness to their manner, quite unusual to the ordinary volatile habits of children in Ireland. I recollect one little barefooted fellow explaining that he travelled daily about 12 miles Irish; his allowance, or rather his gain, was 1*s* upon every six score of eggs brought in, the risk of purchase and carriage resting entirely upon himself. The prices vary from time to time at different periods of the year; but they are never changed without previous notice to the runners. In the height of the season, the prices at Lanesborough were from 2*s* 6*d* to 4*s* per 120; but towards the winter they rise to 5*s*. The eggs are packed in layers with straw, in such crates as are commonly used for the conveyance of earthenware. Each crate will hold about 8,400 of six score, that is, 1,080, the first cost being from 10*l* 10*s* to 16*l* 16*s* per crate. These are sent forward on speculation to Dublin, or occasionally at once to the English market, and a profit of 4*l* or 5*l* per crate is considered a fair remuneration. Sometimes it is more and sometimes less; and there is a risk in the trade. From Lanesborough the crates are sent overland to Killashee, the nearest place on the line of the Royal Canal, and forwarded by the fly-trading boats to Dublin. At Tarmonbarry, I saw several cars coming in laden with crates of eggs from the neighbouring districts on each side of the river. The dealers in Lanesborough, with whom I conversed whilst in the act of packing their crates, seemed quite surprised at my question, whether they ever used any artificial means of preserving the eggs, and could scarcely credit the account I gave them of the possibility of preserving their freshness for a considerable time by simply anointing them with any unctuous substance, such as butter or lard. But in this process the whole of the egg must be carefully covered, and it should be done soon after they are laid.—*Weld's survey of the County of Roscommon.*

## AGRICULTURAL COLLEGES.

We have been much interested by an intelligent communication from a correspondent in one of the French commercial papers, who, after cursorily mentioning the different counties in which agriculture is more or less attended to, and pointing out the consequent benefits resulting to the peasantry, as the means of improving their comforts, and diminishing their poverty, strenuously recommends the formation of agricultural societies in France, praising, at the same time, in the strongest terms, the system of agriculture adopted in Great Britain, and the high and deserving patronage with which it is favoured. He then arrives at the point of argument, which, we acknowledge, struck us as well deserving deep attention, the benefits likely to accrue to France from the establishment of Agricultural Colleges for the practical education of young men destined to become agriculturists, on the same principle as that founded by the Empress Catherine at St. Petersburg, where the students are both practically and theoretically made acquainted with the art of agriculture, having a portion of ground allotted for the experimental part of their study, provided with ploughs and other agricultural implements. They also receive lectures on geology and chemistry, and are instructed in the manures most beneficial for particular soils, to which it might be suggested that a branch of the tuition should consist of the management of cattle, and improvement in their breed. At Moscow, a College has been also established, by the Emperor Alexander, for the instruction in the same science. In Prussia agriculture meets the direct patronage of Royalty; and the Royal Academy of Agriculture, near Frankfort-on-Oder, superintended by one of the most practical, as well as scientific men in Europe, Mr. Thäer, proprietor of the well-known estate, called Moglin, is too celebrated to need any eulogism. From parity of reasoning we would infer, that the institution of such colleges in the United Kingdom might be highly beneficial to the rising generation of British farmers; rendering the sons of the larger landed proprietors, from their practical knowledge, competent to undertake the management of their own estates, or, at all events, would qualify them to ascertain, that their bailiffs adopted the best mode of cultivation, to ensure improvement of the soil, and consequently, an increase of produce. Thus all the drudgery and labour of following the plough in the field or going through the detail at a more advanced age, would be avoided, and the young agriculturist would leave his college practically, as well as theoretically informed, as to the treatment and tillage of the land.

As to the benefit likely to arise from the establishment of Agricultural Colleges, little doubt exists, that by a scientific arrangement, an experimental emulation would be created on the part of students leaving college, and by attempting various theories on their own or fathers' farms, the fertility of Great Britain might be considerably improved, and a decided as well as general impetus given to a cultivation throughout the country; until the operations of the animal, vegetable, and

mineral kingdoms are more thoroughly explored by farmers, there is little chance of any extensive augmentation in the produce of the country. Investigating the nature of the soils, and using various manures to create, or destroy, component parts, that may be beneficial or detrimental in forwarding vegetation, is an essential knowledge and study on the part of a farmer. In many counties, certain manures and systems are adopted from ancient prejudice or ignorance; the fact of the seed germinating, and yielding a return, being thought sufficient proof of the efficacy of the favoured mode of tillage, and it would be quite unavailing to attempt any alteration or experiment deviating from the antiquated system. Whereas, by a more judicious treatment of the land, and an improved method of agriculture, the farmer applying studiously to ascertain the manures most conducive to different soils, the earth might be forced to increase its produce several fold. The principle is at present, however, we fear for the most part theoretical; for, allowing the embryo power of extra fertility in the land, yet the number of agriculturists in England will be found extremely limited, who would be inclined to enter into an experimental system of cultivation. Instances, of course, can be adduced, of education surmounting prejudice; but the present race of small farmers, whose fathers have reared their crops by specified plans of agriculture, are scrupulously followed by their sons, and until, by a different mode of education, you can convince the cultivator of the efficacy of a new system, the reasoning faculties must be more enlarged and enlightened than can be expected in the present generation, though the institution of "*Agricultural Colleges*" would afford the readiest and most effectual means of promoting so desirable a result. What, it may be asked, has caused the Scotch farmer to become an experimentalist, and to make the advancements and improvements in agriculture that he has, but the general diffusion of an improved education?

### PROFITABLE MODE OF FEEDING PIGS.

The following plan for feeding pigs, and which has proved profitable, even in the present extremely low priced times, was communicated by R. Jolliffe, Esq.,<sup>1</sup> of Long Ashton, near Bristol, at the meeting of the Bristol Agricultural Society, on the 28th Feb. last.

Commence with a dam that has fourteen *perfect* dales.\* *Very rarely buy food; never over stock.* When you take them to market, sell to the best bidder; but sell even at a *very* low price, rather than buy food. Two litters may be obtained annually, one *early* in March, the other in October. To obtain that, *wean* the pigs of a Sunday morning, before the sun rises; any other day may do (*that I have never known to fail*). The dam will take

\* Teat.

the male before the week is out. The young pigs require warmth, a dry house, and clean straw often. I exhibited my whole stock,—the dam, one fat pig, and three stores.

one pigs, fourteen of which are doing well and very fine; of the other seven, some were dead. My shepherd has one of last September litter (taken away one day old), a very fine pig about three score.

AGRICULTURE.

RAVAGES OF INSECTS UPON BARLEY AND TURNIPS.

[The following observations on the ravages of insects upon barley and turnips, from the pen of Mr. Farmer, have been forwarded to J. O. Westwood, Esq. F. L. S., &c. and have appeared in the "Magazine of Natural History."]

"The insects accompanying Mr. Farmer's communication consist of one of the small Ichneumonidae, one of the Cynipidae, and specimens of a chrysalis, which he has considered to be that of the latter insect. The first of these is a small and slender Ichneumon, belonging to the aberrant section Adsciti, and the sub-family, Alsyiides. It is of a black colour; the wings are stained dark brown; the tips of the basal joints of the antennae, the thighs and shanks of the fore legs, and the knees of the four hind legs pitchy red: the hind part of the thorax, and the basal joint of the abdomen, are rugose; the antennae are long and multi-articulate, and the abdomen is compressed at the extremity. The wings have one marginal and two sub-marginal cells, the first of which is the smallest, and separated from the discoidal cell by a nerve which runs to the extremity of the wing. In the form of the body, direction of the nerves of the wings, and the structure of the antennae, this insect evidently belongs to the genus Chænon of Curtis; but in the only mutilated specimen sent by Mr. Farmer, the jaws did not seem to me to be extended laterally, as they are in that genus; perhaps, indeed, they might have been broken off. In another specimen, as it appears to me, of the same species, of which I captured many individuals in a corn field near Cambridge and elsewhere, the jaws were extended, the maxillary palpi 6-jointed, and the labial ones 4-jointed; thus establishing the identity of the genus, which has been considered by Mr. Haliday, as synonymous with Cœlinius of Esenbeck; which latter, from having 5-jointed maxillary palpi, and 3-jointed labial ones, belongs to a distinct sub-family, Bracônides.

"Mr. Farmer has not given any account of the larva of this insect; indeed, he merely says, of its preparatory state, that it mostly appeared in the form of pupa, which invariably produced the same ichneumon; whence it would seem that he supposes that this ichneumon, instead of being a parasite, is the real cause of the mischief which he describes, and was, consequently, in the larva state, a feeder on the vegetable. This circumstance would be so completely at variance with every recorded instance relative to the habits of these cuckoo-flies, that analogy would most strongly induce us to reject it, if we could not find, what, I think, I shall be able to show, a more satisfactory mode of explanation. This, it appears to me, will be obtained from an examination of the "chrysalis" which Mr. Farmer has supplied, and had considered as that of the insect which commits the ravages upon the turnips. This chrysalis is of an oblong-oval form, not quite a quarter of an inch long, nearly resembling the smooth cocoon of a small moth, and exhibiting no traces of future limbs; but it is of a hard texture; of a

|                                                                                    |       |     |    |                                    |                                                       |       |     |    |    |

\* The above fat pig was killed on the 4th March, weighed 19 score 8 lb.

N. B. At between two and three weeks old the pigs will eat a little potato squeezed into some skim milk luke warm. At from four to five weeks old they will be fit for roasters, which is a preferable market to keeping the autumnal litter longer, except one or two of the best as stores, or bacon for the family. The pigs mentioned above got the range over four acres of land (constantly fed with horses), the refuse from the garden, weeds, &c.

The sow farrowed on the 10th March, twenty-

dark reddish brown colour, with thirteen rather indistinct rings, and with the extremities furnished with several minute hard points. Now, from analogy, we are enabled to state, that this chrysalis is not the pupa state of Mr. Farmer's turnip insect, because the latter belongs to a family which, in that state, is destitute of any covering, lying in its cell or gall, with all its future limbs perfectly distinct. Until I had more minutely examined this chrysalis, I thought that it might be the cocoon of the ichneumon, as some of that family do spin silken cocoons, and that Mr. Farmer had confounded the two insects; but on magnifying it, I found that it does not belong to either of them; that it was the immature state of a dipterous insect, being the covering of the real pupa, formed of the indurated skin of the larva, that the insect was consequently undergoing the coarctate kind of metamorphosis. Moreover, from its general structure, it appears to belong to one of the fly tribe. *Múscidæ*. This cannot be the chrysalis of the turnip insect, neither can it be that of the ichneumon of the barley. Analogy teaches us that the gall-like protuberances upon the turnips are the results of the attacks of a cynipidous insect, and that the insect inhabiting this chrysalis cannot be the cause of it. What, then, is this dipterous insect? In the absence of direct information, I conceive that Mr. Farmer must have fallen into a mistake; that the chrysalis, instead of being that of the turnip insect, was found within the sheath of the barley; that the injury sustained by the latter plant was inflicted by the larva of this dipterous insect; and that the larva of the ichneumon, instead of being the "anguis in herba" [the snake in the grass], was parasitic upon the real enemy. We know, indeed, that some of the *Múscidæ* (*Tephritis*, &c.) form galls upon plants; but here we have a real gall-fly caught in the act, while I am not aware that any of the gall-flies (*Cynipidæ*) form cocoons; nor that any of the *Ichneumonidæ* are herbivorous. In fact, this is not the first mistake which has occurred of a similar nature, among those who have not paid much minute attention to the ways of nature. How often has the ladybird been regarded as the cause of mischief to plants, when it has only abounded in order to keep in check the myriads of plant lice (*Aphides*) upon which its larva feed! How often has the tomitit been charged with the ravages of our gardens, when it has been busied only in thinning the swarms of noxious caterpillars or other insects; but there are other causes which induce me to fear that this chrysalis is the real cause of the injury to barley, since two species of *Múscidæ* have been ascertained to attack it: *Múscá hórdei* Bierkander, and *Múscá frít* Linneus; which latter insect, although stated by Messrs. Kirby and Spence not to be an inhabitant of Britain, is so similar, in its habits of getting into the ear, to Mr. Farmer's account of his insect, that I should conceive that the latter must be identical with it; and, according to Linneus, the *Múscá frít* annually destroys a tenth part of the produce of this grain in Sweden. The gelatinous larva of a *Tenthredo* (most probably a *Céphus*) has also been ascertained to feed upon the upper surface of the leaves of barley, so as to occasion them to wither.

"According to Mr. Farmer's account, the diseases termed the anbury, and fingers and toes, appear to be synonymous; but, from the observations of Messrs. Kirby and Spence, such does not appear to be the case. These authors, after giving a formidable list of the insects which attack the

leaves of the turnip, mention that the small knob or tubercle, often observable on the roots, is inhabited by a grub, which they consider nearly allied to *Curculio contractus*. They state, however, that it is not known to them whether the disease to which turnips are subject, in some parts of the kingdom, called fingers and toes, be occasioned by insects or not; although, in a subsequent page, they state that they have reared *Curculio pleurostigma* of Marsham from the knob-like grubs on turnips, called, in some places, the anbury. On this subject, the editor, in a note to me, observes, that 'fingers and toes, in turnips, are monstrous fucations of the base of the turnips into forms resembling fingers and toes. When the matter of the turnip has become applied to the formation of these, it does not form a tuber of any considerable dimension; usually, I believe, none at all.'

"From the observations of Mr. Farmer, it is evident, that at least, two very distinct species of insects are the cause of the gall-like excrescences on turnips; but as yet we are unacquainted with the details of their respective proceedings; which, from the totally distinct structure, must be very different. If, even among the obnoxious insects of our own country, so much remains unknown, how great must be our ignorance of those myriads of species which injure us not; what extensive and unrodden fields of pure delight remain, in which the observer of nature may wander from day to day."

## AGRICULTURAL REPORTS.

### SUFFOLK.

Since last report we have had cold, raw, ungenial weather; rain, wind, and frosty nights, &c., and every species of farm-work has been at a stand. The corn previously put in has made no progress; vegetation is backward, and plants are languid and weak.

The growing wheats have improved of late, but much is still unpromising. On light lands and weak clays, the layers fail seriously, and every means have been resorted to to secure some substitute.

Wheat is still ruinously low in price,—lower than for a number of years, reckoning the increased measure and good quality. All other grain crops were very short produce, and the farmer's loss is as much on one species as another. The graziers have at length felt the depression of the times, and the breeders will next have their share. The number of unemployed labourers increase, and women and children have no employment.

We were surprised to find that an opinion prevailed in the House of Commons, that "Barley is not grown on heavy lands, nor wheat upon light lands," that the repeal of the malt-tax would not benefit the heavy land farmers, who wanted relief most." Now, sir, we poor simpletons did suppose that the repeal of the malt-tax would give much greater relief to the heavy land farmers, and to the heavy land districts we may say, than to others; an equal portion of land is appropriated to the growth of Barley on heavy land as on light, over many counties, and the heavy land barley being of inferior quality commonly, and the duty being the same on thin barley as on the best chevalier, the best only are malted, and the lower qualities are used in feeding hogs and cattle in the shape of meal, the low price of pork and bacon occasioned by the import from Ireland, depreciate the value of barley used in feeding, viz. the return is less, and thus the heavy land farmers suffer severely from not being allowed to malt their barleys, and the Marquis of Chandos is

borne out in his calculation, as to the loss sustained. Barley costs as much (in toll and money) to grind as to have it malted, and taking its value for brewing and feeding combined, the value of the crop would be increased to more than one third. It is not merely as to the increased value in fattening stock (which is great) but to give to mares, cows and ewes, after parturition, and to every species of stock, after illness or poverty from bad keep, or inclement weather, and this, added to the increased value of spirits drawn from malt, as compared to that drawn from raw grain, (2s. per gallon, as stated by Mr. Handley) shows a serious loss to the community, probably equal to the amount of revenue obtained from the tax. Double the number of labourers are required to cultivate heavy land compared to light land, for draining, ditching, &c., and their work is much more laborious, requires heavier tools, and spoil more, and require more beer to support them. Thus, altogether, we think, taking off the malt-tax would give relief "where most wanted." We do not admit that the maltsters have the loan of three millions of public money in hand; we consider that this money is so much drawn from individuals—consumers of malt; and that if there were no duty, that such consumers could purchase more malt—that the public have to pay the interest on the capital employed by the brewer and distiller, and that, although the maltsters have money in hand during the winter months, that when the malting season is over they have to pay up the duty, and thus have to advance as much more on risk of the duty as they have previously had less—that they risk bad debts, and require interest for capital in the increased cost of the malt from the duty, we, (the advocates for the repeal) admit that, as the revenue obtained from the duty is great, that it requires serious consideration before its repeal, least public credit be injured; we have given it that consideration, and I think it would not, and claim a right to be heard. We think that, whenever the subject is brought forward, that it is disposed of in too much haste; that it ought to be treated as other subjects are; that all members inclined to give their opinion should be heard; that the debate should be adjourned, to give time for reflection; that we suspect that (and are told) that the "talent is against us;" that the malt-tax might have been repealed without "endangering public credit;" "without embarrassing ministers;" without injury to any class," we are convinced and prepared to prove. If the malt-tax had been repealed in lieu of the beer-tax, the towns population would have been supplied with better beer at the same price as at present, and the country population would have partook of the benefit, and we should not have been pestered with beer-shops, to ruin the morals of the labouring classes, and the common shopkeepers might have sold beer across the counter, the same as other articles. We have pursued the same course during several ministries, in petitioning for the repeal of the malt duty, which shows, that it is from no political bias or factious motives; in fact, we can have none; it arises from perfect conviction that the malt-duty is the most grievous, impolitic tax existing, a very curse. An Hon. Member asserted that, we were relieved from the poor's-rate, were to be relieved from the burthen of tithes and county rates, and that there would then remain no peculiar burthens on land but the malt-tax;" "that no longer ago than yesterday, a modest petition was presented, asking for the total repeal of the malt-tax, and increase of the protecting duties." "He would ask, with what propriety we could oppose a free trade in corn, if all our peculiar burthens were taken off?" We are not afraid that a free trade without duty will be adopted; this would reduce the revenue more in one year than the

repeal of the malt-tax would reduce it in twenty years. The land is not "mortgaged to the public creditor," but the labour and capital employed in cultivating it. Neither our Colonies, nor the United States could compete with the slave-holding States of Northern Europe. Brother Jonathan would hitch up his tariff, and our over crafty manufacturers would have only slaves abroad and paupers at home, to supply with goods. Our lands would be laid down, but would afford some rent, as the expense of cultivation, tithes, and tradesmen's bills would be got rid of, March 25th.

#### CUMBERLAND.

We had a continuance of the same sort of weather that we had throughout the previous winter months, i.e. mild and fresh, without frost, till about the beginning of the past month, when we had about ten days of severe frost, since then it has been extremely boisterous, with a continuance of strong S.W. winds attended with much rain, hail, snow, thunder, and lightning; during the last two or three days the weather assumes a more settled appearance, and if it should continue a very few days, the sowing of oats will commence. The wheats continued to flourish till the frost, which, with the late rough weather, has taken away their verdure. Fodder is plentiful, both hay and straw. Fat cattle are paying the feeder badly; many farmers gave more money for cattle when lean in the autumn, than they can now obtain when fat, and several lots of bullocks that were purchased during the autumn, will not, at present, bring prime cost by 2l per head. Good horses have been in demand at tolerable prices, but inferior ones are dull at low prices. Our corn markets continue very low, wheat is selling at from 4s 9d to 5s 9d. Barley, 2s 8d to 3s 3d, and oats 2s 6d to 3s per imp. bushel. Pork has also been a very unprofitable article, the very finest carcasses will not bring more than 4s per stone. March 17th.

#### AGRICULTURAL INTELLIGENCE, FAIRS, &c.

**AGRICULTURAL STOCK.**—At the sale of Mr. John Harrison, of Wansford, near Driffield, the following stock (all by that celebrated cart-horse stallion, Bank of England, belonging to Mr. John Stephenson, of North Frodingham) were sold for the prices below:—

|                                  | £. | s. |
|----------------------------------|----|----|
| Black Filly, 2 years old, .....  | 28 | 0  |
| Ditto, ditto, 2 years old, ..... | 22 | 0  |
| Black Colt, 2 years old, .....   | 20 | 10 |
| Grey Filly, 1 year old, .....    | 17 | 0  |
| Brown ditto, 1 year old, .....   | 15 | 0  |
| Foal, .....                      | 9  | 10 |
| Ditto, .....                     | 7  | 10 |

**NORTHAMPTON FAIR**, exhibited a tolerably large show of store beasts, a great part of which were disposed of at low prices. Of beef there was a poor show, and dull of sale. The show of fat sheep was indifferent. The best wether sheep, bare shorn, sold under 3s. per stone.

At **OSWESTRY FAIR**, the show of stock was considerable. Fat beasts and store bullocks found buyers, but without any advance in prices. The horse fair was thronged, but few were sold. Small pigs were rather higher in price, large stores were not. Butter in tubs, 7d. to 7½d. per lb. Skim cheese, 2½s. to 3½s. per cwt. Bacon, 5d. to 5½d. per lb.

At **CAMELFORD FAIR**, the show of Cattle, &c. was good, but the demand was very slack, and not many sales were effected,

**CUPAR MARCH MARKET** was considered rather dull, fat cattle bringing only from 6s to 6s 3d per Dutch stone. There were several milch cows in market, for which there was little demand, and prices low. There was no business transacted in the Horse market worth noticing.

**THE LAWTON HYBRID, a NEW TURNIP.**—We have to introduce to the notice of agriculturists another new and valuable turnip for field culture. This variety is a hybrid between the “green-topped Swede” and the “green-topped white Globe” raised by James Wright, Esq., of Lawton, Strathmore, Perthshire. Hence the name. From trials which have been made in various parts of the country during the last season, this variety seems deserving of cultivation. It is a white turnip with a green head, and possesses the advantages of being hardier and yielding a greater crop than any other of the white turnips at present cultivated in the fields, qualities which render it well worth the attention of farmers.—*Quarterly Journal of Agriculture.*

**THE ANNAT BARLEY, a NEW VARIETY OF BARLEY.**—This new and seemingly very superior variety is the produce of three ears which were picked by Mr. Gorrie, Annat Gardens, in a field on the farm of Flawcraig, Carse of Gowrie, Perthshire, in the harvest of 1830; since which period it has been grown at Annat Gardens. Hence its name. Last season it was sown on a ridge in the middle of a field, with Common Barley on the one side, and Chevalier on the other. In bulk of straw it seemed to have the advantage of both these kinds; it was 5 days earlier ripe than the former, and about a fortnight before the latter; and it was also 2½lb per bushel heavier than the Chevalier. From the Annat barley being of so recent introduction, it will be two years at least before a sufficient quantity of seed can be produced to render it the subject of extensive cultivation.—*Ibid.*

**WONDERFUL INSTANCE OF FECUNDITY.**—Mr. Hawker, a most respectable butcher in the parish of Buckereil, has been fortunate enough to possess seven ewes, which have just produced nineteen lambs, of which sixteen are now living, viz:—two ewes, four lambs each; one ewe, three lambs; the four ewes, doubles.

A few days ago a fine young hog pig, about eight months old, was slaughtered by Mr. N. Proctor, innkeeper, of Pool, near Otley, weighing the enormous weight of 64 stones, 14 pound to the stone; the weight of the leaf was 6 stone 2 pounds.

The commencement of the periodical Fat Stock Meetings at Peterborough, was on Wednesday the 11th inst., and both buyers and sellers encourage the hope that they will be permanently established. The supply of beasts was satisfactorily large, and that of sheep unexpectedly numerous. Many butchers, especially from Oundle and the neighbourhood, attended, and sales were freely effected. At the next meeting, to be held on the 25th inst., prizes will be awarded to owners who may sell the best of each description of cattle—which shows that great zeal exists for the success of the meetings. A very large and respectable company sat down on the 11th to an excellent dinner at the Greyhound Inn at one o'clock, Mr. Bark of Alwalton in the chair. The subject of a Wool Meeting annually, the first to be held on the second Petermas fair day (on the 11th of July next), was discussed, and it being the unanimous opinion that a yearly meeting at Peterborough would be highly beneficial to the growers and buyers of wool in the neighbourhood, suitable resolutions were adopted and subscribed; those present pledging themselves to give their support, and it was sug-

gested that the Duke of Bedford, the Marquis of Exeter, Earls Fitzwilliam, Westmoreland, and Aboyne, Viscount Milton, and other noblemen and gentlemen, be requested to give their sanction and assistance to establish such annual wool meetings.

## REVIEW OF THE CORN TRADE IN MARK LANE DURING THE MONTH OF MARCH.

The aggregate average prices of wheat throughout the kingdom do not at present exceed 39s 9d; and though the demand for malting, distilling, and feeding has increased the consumption of the article to an unusual extent, a natural concomitant attendant on a currency, depreciated below its proportionate value; yet it appears, that the stocks in the hands of the growers are much larger at this period of the year, than has been experienced since the passing of the present corn bill. Not that the past harvest has proved so superabundant, but the circumstance has originated, from the fact, that for some years, every other description of agricultural produce has been bearing a relatively better price; and farmers, in many instances, have been induced to reserve their wheats in preference to other corn, anticipating a more favourable conjuncture for its disposal. At the next principal market of the kingdom to our own, Liverpool, the aggregate supplies of British wheat for the last six months, have been upwards of 75,000 qrs less than those of the corresponding period of 1834, at which time a diminution in the imports were noted of about 57,000 qrs, as compared with the forgoing year, making the receipts this season, as little more than half the amount of those for the six months preceding the crop of 1832; notwithstanding which, this falling off in the arrivals has been more than counterpoised by the extent of the supplies from the English farmers, causing the stocks of free wheat in warehouse, inclusive of the colonial imports, to amount to 150,000 qrs, being nearly as large a quantity as has been on hand for many years. In the event of a protracted spring, farmers may feel inclined partially to withhold their stocks; and the low prices, and the quality of the corn, may draw forth from its present torpidity the attention of capitalists as an article offering more than the usual chances of yielding an advantageous return. If, however, genial weather should continue to hold forth a prospect of bringing to maturity the present favourable appearances, little hope exists of an advance of prices, from any decrease of the supplies, the only chance for speculators resting on the probability of the unfavourable result of the forthcoming crops.

During the month from the 23d of February to the 21st of March, the following quantity of Grain has arrived in the port of London.

|               | Wheat.<br>Qrs. | Barley.<br>Qrs. | Oats,<br>Qrs. |
|---------------|----------------|-----------------|---------------|
| English . . . | 30,148         | 16,595          | 11,689        |

| Foreign .... | 111    | 3,158 | 2,928  |

The wheat trade throughout March has been languid and depressed; at the commencement of the month the damp state of the atmosphere considerably affected the condition of the samples, and only fine dry parcels were saleable at the previous currency, other descriptions being almost nominal in value; towards the close, the extensive supplies of wheat and flour, principally the accumulation of several weeks' shipments, that had been prevented arriving by the tempestuous weather, had the effect of forcing prices still lower,—the finer descriptions both of white and red wheat, having receded 1s per qr, and other qualities 1s to 2s, with a heavy sale. In bonded wheat nothing has transpired, and prices are quite nominal.

Flour has been extremely dull, and the large arrival of ship qualities has depressed the trade still lower, good country marks having been lately sold as low as 28s, exhibiting a decline of 1s to 2s from the commencement of the month. Town made qualities remain at 35s to 40s.

The duties have advanced 1s per qr on wheat, making the impost 46s 8d, and 3s per qr on peas. Other articles remain the same as at the commencement of the month.

In the early part of the month the barley trade was almost stagnant, owing to the uncertainty on the subject of the malt duty, and, excepting the very finest and low grinding qualities, sales were only to be effected by submitting to a decline in prices. Good middling qualities of malting and distilling, which a few weeks previous had realised 34s to 35s, could only be forced off at 30s to 32s. On the rejection of the repeal of the malt duty, by a large majority of the House of Commons, Barley became firmer, and more inquiry existing. The better qualities advanced 1s per qr, grinding and distilling sorts remaining unaltered; at the termination of the month, however, the trade again receded, and, with the exception of the finest Chevalier, was 1s lower. Little foreign barley has been imported; the few parcels of Holstein and Danish which have come to hand have proved of good quality, and obtained from 36s to 38s.

The malt, like the barley trade, has been affected by the chances attending the Marquis of Chandos's motion, and business was extremely dull, as the question was whether any allowance would be made on the stocks on hand. It is well, perhaps, to mention, that, as the duty is now collected, the maltsters obtain a large credit from the excise, which constitutes a considerable portion of their capital, as they have facilities for realising the article at the price, including the duty, previous to the same being paid; and the amount of capital thus placed in their hands

may be computed at from two to three millions, which is employed in the purchase of barley. On the result of the division on the malt tax being known, the trade rallied, and the article was rendered more saleable, without sustaining any improvement in value; it has, however, again become dull; best common malt remaining at 95s.

The large arrival of Scotch oats has partially depressed the market, but the supplies of English and Irish having been moderate, the latter from the boisterous state of the weather, has prevented much alteration in the currency. As additional imports from the Sister Isle have been weekly expected, purchasers have only bought for their immediate wants, and confined the business to a limited extent. The prices of Irish oats are firm at 12s 3d to 13s per barrel, free on board, according to quality and rate of freight. Nothing doing in loco in foreign qualities, though purchases have been making in Sweden, Denmark, and Holstein, at 11s 6d to 13s per qr for English account.

Beans, at the beginning of the month, met with rather more attention, and fine old qualities were held on rather better terms; a cargo of Egyptian in bond sold at 20s; latterly, however, the supplies having increased, prices have receded fully 1s per qr, especially of new qualities.

Boiling peas have continued heavy sale; but the duty having advanced to 14s, and precluding the admission of any foreign qualities, prices have not receded more than 2s per qr. Hog samples have been extremely dull, and are fully 2s cheaper. The demand for maple descriptions for seed having subsided, the quotations are 2s per qr lower. The large arrivals of foreign peas must all go into bond and await a more favourable opportunity of being brought upon the market.

The price of tares has suffered a considerable depreciation, owing to the large influx of Scotch qualities, and large quantities must be noted 2s 6d per bushel cheaper, the top quotations of large being 6s 9d to 7s, and good do., 6s 6d.

In France the prices of Wheat are improving, and fine qualities coming sparingly to hand. In some of the more southern departments the continued rains were causing the young wheats to turn off yellow, though the result of the forthcoming crop was still anticipated as likely to be favourable. The mills being now supplied with water, are in full operation, and flour, in consequence, cheaper. At Paris the supplies were limited, and purchasers had submitted to an advance of 1s 2d to 1s 9d. Roye samples were worth 39s 6d; Bray ditto, 37s 9d; Burgundy ditto, 38s 2d; farmers' wheat realizing from 34s to 39s; white qualities obtain from 41s 10d to 43s 5d. The prices of Oats during the past month have continued to advance; fine heavy qualities being scarce, as the stocks generally are short, quotations vary from 19s to 21s 4d per qr. At Marseille the disease of the cholera was mitigating its virulence, and it was hoped that business would soon regain its wonted

activity. Some Pomeranian wheat had obtained 27s. Cloverseed at Paris was limited in demand, but prices steady at 33s to 35s per cwt. At Rouen, Brittany quality was held at 40s to 42s; country samples, 35s to 38s.

In Italy the markets are dull, and prices declining, with the exception of hard wheat, which from its scarcity obtains a higher relative price. At Genoa no hard wheat was offering, and Black Sea soft qualities obtained from 30s to 37s 6d; at Leghorn, white Tuscan realized 45s 4d; red ditto, 35s to 39s 8d; linseed, 49s 7d to 62s 1d. At Naples Barletta wheat might in all probability be purchased at 24s; the stocks in the kingdom were large, and the appearance of the new crop very promising. At Trieste soft Italian wheat 32s, Taganrog hard, 49s 8d; linseed, 58s 7d to 61s 6d.

At St. Petersburg, little alteration had taken place in grain; wheat remained at 21 to 22 roubles per chetwert; barley, 13½ to 14 do., and oats, 12 to 13 do. The sudden changes of the weather, which had been experienced during the winter, exposing the seed sown last autumn, to the destructive alternations of frosts and thaws, had led to the belief that it may have been rotted in the ground, and which is the supposed reason, that has induced the Government to extend the privilege of the free importation of grain during the present year. Some contracts have been entered into at the Lower Baltic ports, for the delivery of rye meal; but while the Government purchase largely, and at different intervals open their stores, retailing grain or meal at lower rates than the market value, it is impossible for the market to remain steady, as mercantile confidence is partially destroyed, being incapable to cope with the power and influence of so despotic a Government. The contracts for linseed had increased to upwards 120,000 chetwerts, mostly Morschanky and similar descriptions. At Riga, the mild weather which have been experienced, had rendered the ice on the Dwina impassable, and had it continued, the water would have become open, but a slight frost having returned, has for the present, prevented the opening of the navigation. Courland wheat remained at 24s to 28s 3d; oats 14s 1d; barley, 18s 11d; Linseed continued in demand, and good crushing qualities were held at 41s 3d. Hempseed was to be obtained at 28s 6d. At Konigsberg the prices of wheat had been kept steady by some speculative purchases at from 27s to 29s 6d; tares were in request, and prices had advanced to 28s. At Danzig the river navigation towards the middle of the month of March, had become quite free, and little chance existed at that advanced period of the season of frost again returning; shipments of wheat were therefore looked for from the interior, and a few supplies had already come to hand; fine new high mixed qualities were noted at 28s to 29s, inferior descriptions had been selling at 22s to 23s, principally for Jersey and Russian account; rye and barley were proved as being a failure in some districts, even of Prussia, and barley had been purchased in order to be sent up the river,

into the interior.—At Stettin, prices remained high in proportion to other ports; and business confined to the consumptive demand. At Rostock and Wismar, wheat was steady in price, and though the supplies were liberal, yet they were much less than would have been received had the roads been in a better state. Barley was in request, principally for the local wants, 15s had been paid by the native maltsters for quality of 52 lbs. Oats were held at 11s 6d to 12s. In Holstein and Denmark good qualities of wheat would be purchased at 20s 6d; fine, weighing 63 to 64 lbs, at 21s. Malting Barley has suffered little depreciation in value; heavy Holstein of 53 to 54 lbs, is held at 16s 6d to 16s 9d, lighter weights 15s 6d to 16s; Danish samples of 53 to 54 lbs, 15s to 15s 3d, 52 lbs, 14s 6d; and there appears little chance of prices going much lower, as there will not be much grain disposable after the seed corn is taken. The small farmers, particularly in Holstein, whose grain this season has been the best, have sold all their stocks; and those proprietors, who have really fine quality, are speculating on an improvement in the currency, when corn is required for seed, and the Russian inquiry commences. A large proportion of the barley now left on hand is very deficient in weight, many samples not exceeding 49 lbs. Oats remain nearly unaltered, as the stocks are decidedly short; the article varies in price from 11s to 12s for quality of 35 to 38 lbs; to 40 lbs, 12s 6d; 41 to 42 lbs, 11s to 12s. Few tares to be obtained. Peas dull at 20s to 21s. At Hamburg some sales of wheat had been made for export to England; and about 70 lasts of old quality for shipment to the Mediterranean. The supplies from the upland continuing small, prices have remained firm; and in some instances fine qualities have realized an advance of 4d to 8d per qr. Some Saale barley had arrived, but the quality was not fine, and which was held at 21s 3d, but not more than 20s 2d was offered by the brewers. Oats unaltered in value. Tares had rapidly receded in price; large quality were selling at 30s; and small might be bought at 27s to 27s 6d. Rapeseed had sold at 27l per last. Cloverseed dull, and both white and red 2s to 3s per cwt. cheaper.

#### CURRENCY PER IMPERIAL MEASURE.

# THE POLITICAL COMPANION

TO

## THE FARMER'S MAGAZINE.

### THE MALT TAX.

(From the Standard.)

The question, then, shortly results to this—Will the agriculturists endanger an administration which they know to be friendly to them—which will not suffer to be impaired the present imperfect defences of the British farmer, and which must—we repeat it—which MUST REPEAL THE MALT TAX, if it get but a very few years of fair trial? Will, we ask it, the agriculturists endanger such an administration with an assurance, that it will be followed by one by which the Corn Laws must be repealed; by one that has injured and insulted the farmer, and that never, if its members are consistent, can reduce a single shilling of the tax, the reduction of which is the matter in experiment? Surely we need not put this question a second time. But it may be objected that the success of to-morrow night's motion will not necessarily endanger Sir R. Peel's administration. We know not whether it will *immediately* destroy that administration, because we have no means of knowing what may be the Premier's intention in the event of a defeat. But that it will *endanger* the present ministry there can be no shadow of doubt. Lord Spencer has, indeed, set this question at rest, by his declaration last year, that a repeal of half the Malt Tax would necessarily break up the government; and this at a time when the government had in its hands an opportunity of making reductions to a very great extent. But let men calmly look at the question in its present position. Suppose five millions of revenue swept away, nay, suppose half the sum relinquished (though this would afford no relief from by far the worst grievances of the Malt Tax)—does Sir Robert Peel hold that commanding position in the House of Commons that he can dictate an equivalent? Is he so much more powerful than Lord Spencer was a year ago, that he can open sources of revenue that defied the utmost strength of his predecessor in the Exchequer? Are his enemies so much more scrupulous and delicate in their opposition than were the opponent of the Whig Radicals of 1834, that he must find it an easy matter to carry through the House of Commons measures of taxation which Lord Grey's government did not dare to contemplate? Suppose, as the case may be, five millions, or two millions and a half of malt revenue abandoned, what are the articles of use, or enjoyment, that will bear a new or an additional taxation? We shall be told a Property Tax—the fairest and most efficient of all sources of revenue, if only it can be fairly arrived at. But how many difficulties oppose the fair collection of this description of revenue? Landed property, indeed, lies obvious to the tax collector—there can be no question that the landed proprietor, or the mortgagee, must pay up his full proportion of a Property Tax, consequently that the farmer and labourer must be compelled to pay, in rent and

reduced wages, at least their full proportion of the impost. Property in the public funds is as open to such a tax. These are the unconcealed and accessible sources of a Property Tax; but what is to be done with the property embarked in trade? How is this to be got at? By what searching process can we ascertain the actual property, whether in stock, or money, or debts, of the merchant, manufacturer, and shopkeeper? And supposing such a searching process conceivable by human ingenuity, is a House of Commons elected, for the most part by shopkeepers and manufacturers, likely to arm any administration with that process? We say no. A Property Tax must, in fact, always bear, with undue weight, upon the landholder, the agriculturist, and the fundholder. This, to be sure, it may be said, would be the reverse of an objection to such a tax in the reformed House of Commons. But there is another objection. A Property Tax is the most efficient of taxes, as far as landholders, agriculturists, and fundholders are concerned. The machinery once put in motion, the change of a figure doubles the revenue, with certainty and without any other trouble. It is the one exception to the general rule, that, in taxation, two and two does not make four. In the case of a Property Tax alone, excessive increase does not diminish. This peculiar efficiency of a Property Tax, was the reason assigned for its early discontinuance after the war. Now, we ask the agriculturists, is there any reason to suppose that the present House of Commons would give this most efficient of taxes to Sir R. Peel's government, before that government shall have had that opportunity that time, we know, will give it to rivet its claims upon the confidence of the people?

### THE MALT TAX.

(From the Times.)

Argued as was the question of the repeal of the malt-tax on Tuesday evening, and disposed of, at least for a long time to come, as the public may probably now consider the scheme which was then rejected, we should be guilty of levity towards the House of Commons, and more especially towards the Right Hon. Baronet the Chancellor of the Exchequer, who treated the subject with such eminent and decisive ability, were we now to re-open the controversy in detail, nor should we by doing so prove less wearisome to our readers. It is sufficient to say that two or three bold and pernicious fallacies have been laid at rest by the vote of that evening, and by the discussion which preceded it.

The ears of the community will no longer be stunned with declamations upon the distress to agriculturists, arising out of the limited consumption of their produce, of which the malt tax has been the cause, when it is ascertained in the clearest manner, that barley, the

grain immediately affected by the malt tax, is more in demand than at any former period, and though produced in larger quantities than ever, bears a higher price than ever, the consumption and the price advancing steadily for the last four years, and the quantity brought to market in the year 1834, a year of deficient harvest, exceeding that of the previous year by above 800,000 bushels! All this while, be it understood, the price of wheat has been and remains lower than at preceding periods; wheat being free from duty, while barley is subject to it.

Another fallacy has been got rid of by this discussion. It had been said that the malt tax had been the sole cause of checking the consumption of beer within this kingdom. Is there, then, no other cause? While the demand for beer has increased not more than from 6,000,000 to 8,000,000 of barrels in 112 years, the use of tea in the same interval has grown from 370,000lb to 35,000,000lb; spirits from 3,000,000 gallons have increased to upwards of 12,000,000; and the demand for coffee, even since the year 1760, has risen from 262,000lb. to 20,600,000lb. The reasoning of Major Handley was curious upon this point, and pretty much in character. Why, quoth this gentleman economist, had not the consumption of beer increased with that of tea, and coffee, and spirits? To which Sir Robert Peel quite naturally answered, *because* there had been such an increase of tea, and coffee, and spirits. The habits of the country have changed, most fortunately, as we think, save only respecting the use of spirits; and the health of those who combine the consumption of tea and coffee with that of beer—nay, of all those women and children, at least, who wholly substitute the use of the two last mentioned liquids for that of beer—has, we doubt not, derived great general benefit from the alteration.

But the grand fallacy was the pretence that the malt tax was an oppression to the “farmers.” This delusion has now very nearly vanished. The farmers have by this time opened their eyes to the fact that they are no more injured by the tax on native barley than any other description of Englishmen, and that they are in no greater degree served by the duties on foreign corn, which some of the owners of land are hypocrites enough to continue for the “farmer’s” exclusive benefit. This jargon begins to be thoroughly understood. If the malt duty were taken off tomorrow, the farmer would be forced by the proprietor of the light barley soil to pay proportionably a higher rent; and if the tax on foreign corn were reduced tomorrow, and the price of wheat (which is doubtful) were to be lowered in consequence, it is not the farmer’s pocket that would be affected, it is the landlord’s, and his alone. The representation which we have now, for the hundredth time, exposed, is nothing less than a fraud in the financial system of country gentlemen, and we are confident that it will not much longer be successful in deceiving even the simplest and rudest peasant.

#### THE MALT TAX.

(From the Times.)

The consequence of repealing the malt-tax, and thereby cutting off, at a single blow, one full third of the disposable revenue of the country, cannot surely have been fully considered by Lord Chandos, when he so zealously pledged himself to press such a motion upon parliament. Those gentlemen who stand un-

pledged upon the question, and who have been induced to lean towards an abolition of the tax by a notion that it would, 1st, relieve the consumer and enable him to drink more beer, or, 2ndly, that it would assist the farmer, through an increased consumption, and a consequent rise in the price of barley, and thus enable him to pay a higher rent,—such gentlemen ought, we think, to pause a little, and ascertain, so far as it can be done without the risk of an actual and irremediable experiment, the probability of the measure so recommended producing the above, or any, good effects, in a degree at all commensurate with the shock to public credit, which must result from a breaking-up of the revenue, without a substitute for the tax abolished.

We stated yesterday that the reduction of duty (amounting to 2s 7d per bushel of malt) would not lower the price of beer to the consumer more than 2d the gallon, or  $\frac{1}{3}$ d per quart—an alteration which can hardly be presumed to extend in any great degree the sale of the article, by consequence to increase the demand for barley, to raise the price of it, or thereby to assist the farmer. If, on the other hand, the sale of malt should be increased by the reduction of the duty, and with it the price of barley, it is obvious that the advanced price of those materials must fall upon the beer drinker, not upon the brewer, so as to neutralise pro tanto, the relief afforded to the consumer by the abolition of the tax, and to weaken the force of one of the two arguments in favour of such abolition, in nearly the same ratio in which it served the other.

It is fairly stated in an intelligent little pamphlet, entitled “Letters on the Consumption of Malt,” that even when the price of beer was reduced a penny per quart, by the abolition of the beer duty, the increased sale arose much more from the simultaneous multiplication of beer-shops, which afforded such facility of access to the liquor, than to the mere fall in price. Yet the addition to the produce of the duty was only a little more than one-seventh of the whole tax, or about 640,000*l.* per annum. The real advantage to the most numerous class of consumers, as well as to the barley growers, would be (were it practicable) an extension of the manufacture of home-brewed beer, which, under the operation of the present law, would give the poor man’s family as good a quart of beer for 2*d* as he can buy of the publican for 5*d*, and would naturally and inevitably, by increasing the demand for malt, enhance the market price of it. But that is not contemplated by the proposal of Lord Chandos, nor could it be effected by any such mode of legislation. A saving of little more than a farthing in the quart of beer by the repeal of a tax, pressing equally on all purchasers of malt, would not stimulate the poor man to a practice, to which he has not been already tempted by a profit of 2*d*.

The fact is, that if the malt tax were repealed tomorrow, neither the poor consumer nor the industrious farmer would be a gainer by it to the amount of 5*s.* in the 100*l.* The price of one description of farm produce—viz. barley—might be raised by a more enlarged consumption. But does any one imagine that the owner of the soil would permit the cultivator to benefit by the change to his own (the landlord’s) exclusion? Is any one simple enough to conceive that if the produce of an acre of barley land were to fetch a better price, the same acre would not also be valued by its proprietor at a better rent? The same confusion seems to prevail upon this subject as upon

every other involving the relations between landlord and tenant, whether with regard to the price of grain, or to the privilege of voting for members of parliament. The establishment of corn laws is invoked by what goes under the name of the "agricultural interest," as a necessary protection to the tenant, who has really in the long run, nothing to do with it, except in so far as he is a consumer of corn, seeing that if the tax on imported corn protects anything, it is the landlord's rent, and not the tenant's profit, just as tenants at will were said to be enfranchised by the Reform Bill, for their own sakes : whereas it is in the interest of their landlords that their votes have been almost invariably given. Those acquainted with the details of the malt trade have demonstrated pretty clearly that by the repeal of the tax, capital to the amount of 5,000,000*l.* sterling, now employed by the brewers in stirring and animating the trade would, for a time at least, be withdrawn from the market, and must be replaced by fresh capital, bringing with it a new and more languid method of dealing between farmer, maltster, and brewer.

Nevertheless, the main point to be now considered is the alarming deficit which would at once appear in the general revenue of the country, while it is obvious that very few of the Whigs or Conservatives are prepared to adopt the only efficient substitute, viz., a tax on property. It is, we think, impossible that such a measure should be carried, and we shall, as was before hinted, cordially congratulate the noble Lord who introduces it on his double good fortune—the redemption of his pledge, and the defeat of his motion.

#### THE MALT TAX.

(*From the Globe.*)

The ministers triumphed over the country gentlemen last night, and the triumph, as far as regards the question of the malt tax, is decisive. We are equally pleased at the victory, and the mode in which it was obtained. Public faith was saved, but with a fearful consumption of Tory popularity and honour. The merit of saving public credit belongs to the reformers ; the disgrace of present treachery and former faction rests on the ministers and their adherents.

That the repeal of the malt tax would be popular for the time, there is no denying. But we cannot bring ourselves to think that it should be conceded ; because, with all the evils of the tax, we do not look upon it as the most mischievous of existing imposts, or as the one from which relief is most desirable. The consumers of beer imagine that the removal of the tax would cheapen beer ; the farmers that it would have the effect of enlarging the sale, and raising their profits, by raising the price of barley. Both appear to us to be mistaken ; the former to a very great degree, the latter wholly. As long as, by the prohibitions on foreign produce, the supply of malt is confined to this country, the repeal of the duty would very little cheapen beer, and very considerably raise the price of barley ; and while the occupiers and cultivators of the land are for the most part rack-renters or tenants from year to year, the raising the price of barley will raise—not the profits of the farmer, but the rents of the landlord. Now, much as we should desire to augment the enjoyments of the working classes, or relieve the lamentable distress of the farmers, we do not wish to make any sacrifices to the landlords. They at least are not the first and fittest objects of financial commiseration.

We grant that the unpopularity of the tax is a very strong argument against retaining it ; and that if it is matter of certainty that the general feeling against it must prevail sooner or later, it is the wisest course to abandon it at once. But such a concession of policy to public opinion can only be justified by absolute necessity ; and we ought to have far stronger evidence of the strength and permanency, as well as the extent of the feeling in question, than we have had, ere we comply with it. At least, before we yield to an erroneous opinion, let us endeavour to enlighten it. Let us point out the real effect of this tax at present, and the probable consequences of its removal ; let us show the working people and the farmers that their exertions, instead of getting them comforts and necessities, will merely increase the country gentleman's command of luxuries ; and we shall probably hear somewhat less of this outcry ere long—particularly if a certain party in the State find that it is not so much their interest to agitate the question, and that if tampering with the passions of agriculturists is sometimes the way to get into Parliament or into office, the enjoyment of the dignity is liable to be disturbed by the mode in which it has been acquired.

But, after all, the question was decided on more weighty considerations. There is no use in mincing the matter : the question last night was, whether the funds should be attacked or not. We must do some gentlemen the justice to say, that they talked vaguely of meeting the defalcation by economy. Mr. Hume was the only person who committed himself to the specific absurdity of pointing out the items in which nearly one-fifth of the whole controllable expenditure of the State might be saved within the year. As for the talk of substituting a property tax, it is really quite unfair in any one, considering the difficulty of overcoming all the objections in principle—all the obstacles of detail—all the prejudices and interests which are opposed to the imposition of a property tax—to talk of it as a certain mode of supplying any defalcation in the revenue. When we see not a mere bill, but an act for imposing a property tax, then, and not till then, shall we think it reasonable or honest to talk of repealing taxes on the faith of finding such a substitute.

#### THE MALT TAX.

(*From the Morning Herald.*)

An evening contemporary (the *Courier*) has an article upon the important subject of the malt-tax, evidently prompted by some free-trade theorist, and written by a party wholly ignorant of the position of the agricultural occupiers and labourers, as well as the custom of tillage throughout Great Britain ; at any rate the writer is one who is most anxious to blink the real question, for the sake of perpetuating his cruel theories against the industrial portion of the British empire. His notions savour so much of the Macullochite empiricism, that we should not have noticed them but that we know that empirics sometimes dispense most dangerous commodities. He commences by stating that there are many raw materials of manufactured articles that ought first to be relieved from taxation before the malt duty is disturbed. We willingly accord that we wish our crippling system of excise was exploded, and it should be the first endeavour of the government to get rid of that system which, with all its cumbrous inquisitorial machinery, is maintained at the enormous charge of 17½ per cent. on the ag-

gregate. But the writer, in talking about the raw material, has forgotten that the tax on malt is actually a tax upon the raw material called barley, from which, if once the duty were removed, the poor and industrious cottager might brew a wholesome beverage with the cost at the outset of merely a few utensils that would not amount to the indirect duty he now pays for the poisonous stuff he is compelled to drink at the beer-shops and public-houses in the course of three or four months. Again, we deny that the cottagers have generally left off making their own bread; where they have so done it is in consequence of their poverty, and that only in the immediate neighbourhood of large towns. Our personal knowledge bears out this assertion. And he also proves himself little acquainted with the internal economy of the peasant's cottage in decidedly rural districts, when he asserts that his clothes are not mainly prepared at home; in fact, the means of the farming labourer are so reduced that he cannot purchase them already made. So much for this part of his reasoning. That the peasant should be enabled to return to the good old, and still existing custom, in many instances, of brewing and baking, &c., at home, is one of the great objects for our advocacy for the repeal of this onerous tax, because we believe that it will lead to a regeneration of character in that useful portion of our population, which the application of Malthusian and Macullochite theories have tended greatly to lower. The writer says that the abolition of the malt tax will only relieve the occupiers of light lands—to wit, the barley growers, who, from his account, would appear to have made large fortunes by the application of bone-dust for manure. This is a curious apology for the perpetration of the malt tax, and shows that the writer has but a shallow and limited knowledge of agriculture—almost as limited as the supply of bone-dust is now annually becoming, either for heavy clay, wheat, or light barley lands. Verily it is but the paltry excuse of a free trader in corn to accelerate the downfall of the agricultural occupiers by flooding the country with foreign barley in order to suit his private views. He must, if he pretends to knowledge at all, have known that, had it not been for the general adoption of an improved system of applying manures during the last 20 years, that the corn and meat growers of this country could not have maintained their position as they have done. But we must dismiss this twaddler on the malt tax—this masked advocate for free-trade principles at the expense of more than six millions of the British population. Yet we cannot conclude without expressing to the agricultural interests our conviction that the repeal of the malt tax is but a preliminary measure, which will be incomplete without a thorough reform in our monetary system, from which, if the Administration flinch, it truly will merit the reprobation of all who wish well to this country; but we hope, since the King's Speech from the throne has reiterated the admission of agricultural distress, that this important interest will no longer be neglected.

#### THE MALT TAX.

(From the Herald.)

The Marquis of Chandos has, as we anticipated, redeemed his pledge to his constituents, by persevering in the motion which he brought forward last night for the repeal of the malt tax. Great anxiety had been felt and expressed during the last few days in

many quarters, at the approach of a question upon which it was known that the agricultural interests felt strongly, and upon which it was equally well known that the Ministers, for obvious reasons, felt strongly also, though, unhappily, in a different sense—the one denouncing the impost as a burden on the land, the other clinging to it as a productive source of taxation. Amongst the conjectures to which this state of anxiety gave rise the postponement of the question for the present became very general. We need not say that the conjecture was erroneous, for our column this day record one of the most important debates that has ever taken place on the subject. In the speech of the Marquis of Chandos will be found a striking exposition of the whole case of the malt duty, not only in its bearing upon the agricultural interests, but upon the general interests of the community. Nothing could be more characteristic of the manly qualities of the noble speaker's mind than the ardour with which he expressed his determination to keep faith with his constituents. He could assure the head of his Majesty's Government that it was not with any view of embarrassing them—it was exclusively in fulfilment of his pledge to his constituents, and of the duty which he considered he owed the country; and deeming it to be his duty to bring it forward, nothing under heaven should prevent him bringing forward the motion." But, in spite of this ardour, in spite of the sound practical views contained in the speech itself, and of the impressive and affecting eloquence by which they were enforced, the motion was lost by a large majority, and thus another instance was added by another Parliament to the many already upon record, which prove the difficulty of overcoming old and rooted prejudices even in assemblies and amongst minds that make a boast of their superior intelligence. It is mortifying to see a Minister like Sir Robert Peel set himself, at a moment like this, against a measure to which the agriculturists have long looked as the best means of affording them relief. As for the bugbear of a property tax, upon which he seemed to rely so much, and upon which his reliance most certainly did not fail him, every one who looks at the financial condition of the country must know that, to a property tax, in one shape or other, we shall be obliged to come at last. Even the Members of that House, with whom we are persuaded this argument had more influence, because it came in the shape of a threat, than any argument applying more directly to the question—even the Members of that House are aware that a property tax must in the long run be resorted to as the only practicable means of shifting the pressure of taxation from those who are not able to those who are able to bear it. Looking at it in this light, what a short-sighted policy does that appear which, merely for the purpose of gaining time, or adding a few years—it may be months—to the exemption in which they exult at present, would run the risk of alienating an important class of his Majesty's subjects from the Government and institutions of the country. Well might Lord Chandos warn the Administration, as he did last night, that a few proceedings of this kind would destroy all confidence in their measures, and all hope from their establishment in office. Those only who are acquainted with the state of the agricultural districts can form an idea of the disappointment with which the decision of last night—the decision of the new Ministry and the second reformed Parliament—will be received amongst them. It may have saved the Administration some trouble in the financial arrangements for the year, but it will neither add to their strength nor benefit their reputation, nor increase the chances upon which they may calculate for a continuance of their power.

## IMPRISONMENT FOR DEBT.

(From the Times.)

We have received several letters respecting Sir John Campbell's bill for the "abolition of imprisonment for debt, except in cases of fraud." More urgent matters have prevented us noticing till now the re-introduction of that measure, the discussion of its merits in the House of Commons on Wednesday last, the course it is intended to pursue with regard to the progress of the bill, and the communications of our correspondents.

The history of the bill lies in a very small compass. It is no measure of premature or gratuitous legislation. The common-law commissioners reported in favour of such a bill after examining parties of all descriptions—from the petty tradesman up to the greatest merchant. The evidence of these parties, which extends over some hundreds of folio pages, has been some time published. A committee of the House of Commons confirmed the view taken by the commissioners. The bill was brought in last session: it was printed and extensively circulated throughout the country. Sir J. Campbell stated on Wednesday, that he has himself received hundreds from creditors as well as from debtors, urging him to proceed with the bill. Under these circumstances he renews the measure, and it has been once more referred to a select committee of the House of Commons.

It is hardly possible that more ample means could have been exerted to prepare the bill carefully, to make its provisions generally known, to court suggestions for the improvement of its details, and to rouse into action the opponents of its principle. If, however, there remain any persons who desire to be heard against the measure, or against any part of it, their course is easy. The bill is now before a select committee of the House of Commons, and we are quite sure that the members will be happy to examine any one who has suggestions to make. If that mode be disagreeable or inconvenient to any one, he can embody his views in a petition to the House, and ask the member who presents it to move that it be referred to the committee on the bill,—which will be agreed to as a matter of course. Our correspondents will do well to avail themselves of one or other of these facilities of enforcing the objections they entertain to any of the provisions of the bill, and of suggesting any improvements which have occurred to them.

In the debate on Wednesday, and in the letters of our correspondents, there is but one practical objection to the bill which we think deserving of consideration. It is this—the bill, say the objectors, gives a summary remedy in the case of bills, promissory notes, &c., whereas no such remedy is given with reference to book debts, as they are called. The following case is put as an illustration:—A shopkeeper gives a bill at a certain date to his manufacturer or warehouseman; he gives it on the faith of the promise of his book-debtors that they will pay what they owe by the time that the bill becomes due;

they fail in the performance of their promise; the bill becomes due; the shopkeeper cannot take it up, and the warehouseman has a remedy against the shopkeeper which the shopkeeper has not against his book debtors. It is obvious that this is very much the case under the existing law—in other words, that the man who has taken a security is in a better condition than the man who has taken none. If a man now bring an action upon a bill of exchange or promissory note, his course is easier and less expensive than that of the man who has to prove the delivery of goods, their value, and the liability of the party whom he sues. But it is not probable, or rather it is not the necessary consequence of the bill of Sir John Campbell, supposing it passes into law, that every trader will take the security of a promissory note? there might be some little inconvenience in this, but it is as nothing compared with the general benefits of the measure. The nature of the one debt must in every case render the process of its recovery more lengthy and difficult than that of the recovery of bond or bill, or promissory note debts, on the face of which are admitted those things that must necessarily be proved in the other case before a man can be compelled to pay the amount claimed of him—and those things are the delivery and value of the goods, and the liability of the party proceeded against. However, the objection, as we have already said, deserves attention, and we have no doubt it may be met to the satisfaction of the parties who urge it. Where they may urge it with most effect we have also told them.

It is mere nonsense to say that this measure will "do away with all credit;" though we readily admit that it must put a stop to some transactions to which it can hardly be expected that the legislature will extend its protection, because it is not for the welfare or the respectability of the community that they should be tolerated. Indeed, it is upon that very ground that many support the bill. Thus it is supported by Mr. Bernal, Mr. Clay, and Mr. Grote. Mr. Bernal said in the debate that it will destroy what has been substituted for credit, namely, "unlimited confidence"—what Mr. Clay declared to prevail, viz. "*gambling credit*, which keeps up the high prices of inferior articles"—what Mr. Grote called "the wild and injudicious system of credit,"—which he also said was but too common. We see nothing to regret in this, on the contrary, we participate the approbation so expressed and concur in the reasons for it.

The other objections urged in the debate, chiefly by Mr. Baring, were objections to the principle of the bill, and in favour of that the vast majority of the public has already so strongly and so frequently pronounced its opinion, that we feel we should be wasting our own time and that of our readers if we were to say one word in its defence.

## THE MALT TAX.

Although this question is settled for a time, it must *again* be brought before the notice of the House of Commons. Justice *must* be done to the farmers. It will then be of importance to know what were the arguments used in opposition to the repeal upon the late occasion; and, which produced such an astounding effect upon *certain* county members, as to induce them to forfeit the solemn pledges made to their constituents. For these reasons, and believing that our pages could

not be better occupied, we have given a full report of the speeches made upon the Marquis of Chandos's Motion.

TUESDAY, MARCH 10. — The Marquis of CHANDOS rose to bring forward his promised motion for the repeal of the malt tax. The desire of promoting the interests of the country at large was the only motive with which he brought forward the present motion. He could assure the head of his Majesty's government that it was not with any view of embarrassing them; it was exclusively in fulfilment of his pledge to his constituents, and of the duty which he considered he owed the country, and deeming it to be his duty to bring it forward, nothing under heaven should prevent him bringing forward the motion. He could not promise the house that he should be able to enumerate any new arguments in support of his motion—he had only to repeat the tale of wretchedness and distress of the continued condition of agriculture, and the conviction of its existence it was now his endeavour to impress upon the house. When the malt tax was first imposed it was small. First it was 4s a quarter, in 1787 it was 10s 6d, in 1791 it was 12s 6d, in 1802 it was 18s 8d, in 1817 it was 38s 6d, and in 1827 it was diminished to 20s 8d, an amount at which it now stood. He admitted that a partial reduction, any reduction, would afford acceptable relief; but if any part of it were allowed to remain, the expense and vexations of the excise system would continue, which he did not desire. To get rid of the whole would relieve the farmer from vexations, and would be most beneficial to him in every point of view, and would be most advantageous to the best interests of the country. (*Hear, hear.*) He well knew how harrassing and ruinous the malt duty was to the farmer, and the best interests of agriculture, and of the country. It greatly diminished the consumption of barley, it prevented the farmers from having their agricultural labourers in their houses (*hear*), and it caused a depreciation or disuse of the national beverage. (*Hear.*) The malt tax was formerly an annual tax, like the sugar duties, &c., but in 1822 it was made a permanent tax; therefore the parliament had since that period ceased to have the annual control over it that it formerly possessed. The result of the tax had been most prejudicial; besides injuring the farmer, and the farmer's habits towards his labourers, it diverted the taste of the working classes from the truly national beverage, beer, to the consumption of ardent spirits. It had diminished private breweries, and had led to the increase of public breweries and of beer-shops, and, worst of all, to the increase of "gin-palaces." (*Hear.*) They were now to be seen everywhere, and the tendency of them was most pernicious to the morals and the comforts of the people—the great increase of the destructive habit of consuming ardent spirits was but too manifest. It had obviously led to great increase of crime. Between 1812 and 1819 there were 72,216 persons accused of criminal offences; between 1819 and 1826 the numbers had increased to 95,628; and between 1826 and 1832 the number had increased to 131,818—among whom were 12,000 women committed from the police-offices, being originally charged with drunkenness. (*Hear.*) These facts, and the diminished consumption of the national beverage, were demonstrable. The distress was admitted in the King's speech, and some relief had been hinted at; but if no more were contemplated than relief from some local taxes—such as church rates, &c., he could tell the

Chancellor of the Exchequer that such relief would be quite inadequate, and would cause universal disappointment. (*Hear, hear.*) He had made a comparison as to the relief that would be afforded by the different courses. A farmer of 250 acres, by the repeal of local taxes, would be benefited to the extent of 8l; by the repeal of the malt tax he would be relieved to the extent of 70l or 80l a year. (*Hear.*) If hon. members would but look through the country at the state of the farm-houses and of the farmers, they would find scarcely a single man—with the exception, perhaps, of their own tenantry—in the condition in which he was many years ago—able to brew his own beer, and to maintain his own tenants. (*Hear, hear.*) They were now compelled to depend upon the common brewer for the beverage they consumed, and were compelled to purchase that which they formerly manufactured. What could be finer, or more grateful to the feelings, than to look back to the period when every farm-house had its circle of domestic labourers congregated round the fireside, or seated at the table of their master, partaking of the national beverage, the home-brewed beer? (*Hear, hear.*) But now they were constrained to slake their thirst at the pump, or, mayhap, at the nearest ditch, as the employer was unable to purchase, and was not permitted to brew, the beer which he formerly served out from his own casks. (*Hear.*) He trusted that in a British House of Commons, where there were so many country gentlemen, who owed their seats, too, to their pledge upon this subject—(*loud cheers*)—in such a house he should not, he trusted, appeal in vain on behalf of those to whom they owed their seats—nay, their very existence in the country (*cheers*); and this at a time, too, when the agricultural interest was beaten down—when the landlord was obliged to leave his house—to visit a foreign soil,—when the mansions of the gentry were closed up, and those who should depend on them for support were obliged to drag out existence in a workhouse. (*Hear, hear.*) It was utterly impossible that such a state of things could go on—and it was time for the government and the House of Commons to take into consideration the distress which existed, and, by adopting the plan which he should have the honour of proposing, to give relief, as he hoped, to the agricultural classes and satisfaction to the country. If he asked the relief which he now sought at the expense of any other class of his Majesty's subjects, he should feel that it would be as unbecoming him to solicit as it would be for the house to display such a partiality. (*Hear, hear.*) But, in relieving the agricultural classes, they would relieve the community at large, who, instead of grudging the relief, would hail the concession as an act not less of justice than of policy. (*Loud cheers.*) If the house would look at the question in another point of view, they would find that the great profit of the malt trade found its way into the pockets of the maltsters. The noble lord then read a statement exhibiting the entire amount of revenue derivable both by the maltster and the Exchequer from the consumption of malt in the year 1833, taking that as an average year. This amount, up to October, 1833, was 16,303,000l, produced by more than 40,758,000 bushels of malt, at 8s per bushel, including the maltster's expense (3s per quarter), and the extra expense of excise, &c. (3s 6d per quarter). Of these 16,303,000l, only 4,923,000l found their way into the Exchequer; and the balance became the profit of the maltsters. (*Hear, hear.*) He did not mean to say that the maltster was not entitled to a fair profit;

but he contended that such a profit as was exhibited by his statement was most unreasonable. It was apparent that the relief which was sought would not be confined to one class, but would be shared by the entire community; the trade would be thrown open and the opportunity of competition afforded to the brewers. But another evil that flowed from the imposition of this tax was the introduction of a very bad material into the market. In illustration of this he should mention one fact;—in London, the quantity of malt consumed in manufacture from 1720 to 1730 was 500,000 quarters; the same quantity was consumed from 1790 to 1800, while the quantity of liquor in the former period was 3,000,000, in the latter 6,000,000. (*Hear.*) From this it was obvious that the quality of this material must have been greatly deteriorated. (*Hear.*) There was another point of view in which he was anxious that the house should look at this subject. By a repeal of this tax they would in many counties afford the feeders of cattle an opportunity of feeding large cattle upon the refuse of the malt, which the excise duty prevented them from doing at present. In his own county they fed principally upon oil-cake, which was expensive; and he knew that they would willingly feed upon the refuse of the malt, if the opportunity were afforded them. There again would be a direct advantage to the farmer, as well as to the public, for the maltsters would only take the very best barley, and the refuse was almost necessarily thrown upon the public. It was very true that in his (Lord Chandos's) own immediate neighbourhood the taking off the malt tax would not produce any very immediate benefit, but, coming up the country, where barley was more generally grown, the benefit would be very extensive; and he felt warranted in saying that any alteration in the present law would be hailed with satisfaction by the country, as an indication of their intentions to afford relief to the agricultural classes, whenever it was practicable. (*Hear, hear.*) It was utterly impossible for any government to go on and maintain the present duties. He had endeavoured with others who had preceded him, to obtain their repeal, and he regretted that now, as then, his exertions might not meet with the success which he was convinced they deserved; (*hear, hear*), but he would at least have the satisfaction of laying before the house the case of the distressed agriculturists, and of hearing the grounds upon which hon. members could justify their votes against his motion who had come into that house on the express pledge of supporting it. (*Loud cheers from the opposition.*) He was perfectly well aware that his right hon. friend had a right to call upon him, when taking off one tax, to state what substitute he would impose to make up the deficiency in the revenue? Though in reply to such an interrogatory he might have recourse to the observation of Mr. Tierney, who said that it was his business to find fault with taxes, not to impose them. (*Laughter.*) He certainly felt considerable reluctance to enter upon a financial statement—particularly after the budget produced last year by the hon. member for Lincolnshire. (*Laughter.*) He feared he should not be able to submit to the house any thing so comprehensive as that, and he should therefore confine himself to the proposition introduced last year by the right hon. the Secretary of the Board of Trade, in order to make up the deficiency he should impose upon spirits, foreign wines, &c., such a duty as, without trespassing upon the comforts of the poor, would be only an equitable revenue derived from

the luxuries of the rich. (*Hear, hear.*) For his own part he was quite ready to bear a greater burden than that imposed upon him, if by so doing he could take from the shoulders of the humbler classes a weight greater in proportion to their capacity to bear it, than that imposed upon himself. (*"Hear" and cheers.*) It was utterly impossible that the agricultural classes could continue in their present condition, under the increasing pressure of local taxation, unless they were assisted by that house, not in a shape of remission of small taxes, but by some one decided measure; and that to which they looked with the greatest confidence and expectation was the repeal of the malt tax. (*Loud cheers.*) He had been induced to think that in submitting this motion to the house, it would have been necessary for him to propose a more lengthened resolution than that which he was about to submit to their consideration. However, he did not wish to pledge the house to any exact period of time at which this tax should be taken off, for he thought the interest of the maltster should be consulted, that he might get rid of his stock on hand; and he did not wish that the Chancellor of the Exchequer should be called upon for any drawback. (*Hear, hear.*) Taking also into consideration the difficulty that must be created by taking off by one resolution five millions of the public revenue, he felt that he consulted the interest of the community, and of the country, when he proposed that the house should agree with him that it was necessary to effect an entire abolition of the duty on malt; (*cheers,*) and asking of the house permission to bring in a bill regulating the time and the instalments by which it should be effected. (*Hear, hear.*) He did not purpose at once to extinguish the entire duty; but he thought it might be done in two or three instalments, by which means he would relieve the embarrassment of the Chancellor of the Exchequer, (*laughter,*) afford a fair protection to the maltster, and give perfect satisfaction and contentment to the English farmer. (*Hear, hear.*) God forbid that he should get up in that house to propose any measure injurious to the public creditor. (*Hear, hear.*) He was not the man to do that; but he was the man to propose a gradual but decided measure of relief to a class of men to whose distress that house could not be blind, and whose condition demanded the most serious and most favourable consideration. (*Cheers.*) Upon looking back to the efforts already made to procure a repeal of the malt tax, he found that there were in the present parliament many gentlemen who upon former occasions had given that question their serious attention, and expressed a hope that the existing system would be altered in the present session—many there were, too, pledged to their constituents to vote for its abolition. To these, and to the great body of English gentlemen by whom he was surrounded, he appealed to fulfil the promise upon which they had been returned to that house. (*Loud cheers.*) They were pledged to advocate the cause of the farmers, and in that advocacy to give effect to the motion which he had the honour of proposing. (*Hear, hear.*) It was not his business to find fault, nor would he do it, with the conduct or opinions of any man. He brought forward his present motion because he felt himself bound, as an honest man, to discharge that act of duty, to redeem the pledge which he had given to the country; and, whatever might be the result of his motion, he should at least have the consolation of reflecting that he had done his best to serve the agricultural interest, and that he

had not swerved from what he conceived to be his duty as an honest man and an independent member of that House. (*Cheers.*) He wished that other hon. members would consider themselves similarly bound, and that he could calculate with confidence on the result of that night's debate. (*Hear, hear.*) But he feared that the result of the division would not be such as to satisfy the just expectations of the country. It might fall to the lot of some one more worthy than himself to see his exertions for the repeal of that tax crowned with success; but his failure could not at least be attributed to any want of ardent anxiety upon his part to see it carried into effect. (*Hear, hear.*) He had stated before that it was his intention to propose a resolution, calling upon the house to vote for the extinction of the duty upon malt: but he at the same time said that if he succeeded, he should ask the liberty of the house to introduce a bill, embodying an arrangement with respect to the time at which the reduction should take place. In stating this he wished the house distinctly to understand, that in agreeing to his resolution they did not bind themselves down to any specific time for it to come into operation; (*hear, hear.*) this question would arise hereafter—and whether it should be permitted in two or three instalments. He thought it necessary to throw out these observations, because a long resolution might have the effect of embarrassing the question, which was in itself simple and plain. (*Hear, hear.*) He felt that he should not be justified in trespassing at greater length upon the attention of the house. No words of his, no abilities, even more powerful than he possessed, could strengthen the case which had been advanced on behalf of the distressed agriculturists. Last year, when he brought forward this question, he was able to draw the attention of the house so closely to the case of the labouring classes, that, by a very small majority his motion was rejected. The smallness of this majority showed the sense of the house with respect to the existence of distress; and he could assure them that this distress was now certainly not less than it was then. (*Hear, hear.*) The price of the produce was diminished, not increased; and if he did not enter at length into the question of the agricultural distress, it was not, he could assure the house, from not being fully impressed with a conviction that this distress existed, and to a very lamentable extent. (*Hear, hear.*) He thanked the house for the indulgence they had extended to him, and should not longer trespass on their attention. He had laid the case before them as simply as he possibly could; and he should now leave it in the hands of a Jury of English gentlemen, reminding them, however, that the question which they were called upon to decide was not whether the tax should be abolished immediately, but whether it was to be abolished at all. (*Loud cries of "Hear, hear."*) He could not possibly see how any hon. members could plead that they were taken unawares, particularly after the speeches he had read as having been delivered in different parts of the country. (*Cheers.*) At the recent election the agricultural interest had supported many members of that house in their hour of trial, and they now called upon them in return to fulfil the pledge they had given. (*Hear, hear.*) The noble lord concluded, amid loud cheers, by proposing the resolution—"That it is expedient that the present duty on malt do altogether cease and determine."—Major HANDLEY knew how difficult it was in times of political excitement to separate the ques-

tion really before the house from all considerations but those really pertaining to it. (*Hear, hear.*) His object in the line of conduct he should adopt was not, he could assure the house, to obtain any party triumph, but to pursue a conscientious course upon a most important question. (*Hear, hear.*) He could bear his testimony to the accuracy of the noble lord's account of the distress which existed amongst the agricultural classes—a distress with which the government, it would seem, was unacquainted, though assisted by the counsels of hon. members for Essex and Kent. If the government did really believe in the existence of that distress, and to its full extent, he felt assured they would not have confined themselves to offering an insult to their feelings by that mockery of relief contained in the speech from the throne. (*Hear, hear.*) In the year 1821, when a committee sat to inquire into the causes of agricultural distress, wheat was 54s 5d per quarter; in 1833, when another committee sat, it was 53s per quarter; and they had now arrived at 40s 4d, as the average price of wheat. Even this price, he was aware, it did not generally bring—certainly not in his county, where he, last week, sold wheat of the very best quality, for 37s. (*Hear, hear.*) With such a price as this, he asked how was it possible for the agriculturist, even if he had his land rent-free, to grow wheat? (*Hear, hear.*) Such a state of things, he contended, required something more than the appointment of a committee, or the empty sympathy of a sentence in the King's Speech. (*Hear, hear.*) The malt tax he believed to be the most malicious—the most partial—the most unjust of all the evils that afflicted the agricultural classes. It was partial, for it affected only one class, and that one the least able to bear it. It was most demoralising in its effects, and it was most impolitic, because it placed upon the threshold of the malt-house an obstacle to its consumption. The evidence of this would be found in the fact that the consumption of tea and coffee, as proved from the excise returns, have increased the one 40 and the other 200 per cent., while no such increase took place in the consumption of malt. This did not arise from any disinclination on the part of the people to use malt, for it appeared that spirits distilled from malt was 2s per gallon dearer than that produced from raw grain. (*Hear.*) How much of it, too, would be consumed in the feeding of cattle? It was a fact that 7s a-head was paid for bullocks feeding upon wash at distillers; and in all the agricultural societies with which he was acquainted, the prize cattle were not allowed to be fed upon wash, because, while it was the most fattening, its price put it out of the reach of the poorer classes. (*Hear, hear.*) Why, he asked, should the people be obliged to purchase oil cakes? The nicety of metropolitan palates, he believed were sometimes offended by beef fed upon oil cake, which, it was thought, imparted a disagreeable strength to it. Now he would ask hon. members to vote with him on this motion, and they would have their reward in the improvement of their beef and mutton. (*Laughter.*) It might be said that this motion would only affect barley; but he would ask the farmers of clay lands, if there were a demand for barley, would it not in many cases displace wheat? (*Hear, hear.*) The hon. member then adverted to the benefit which would accrue from the repeal of the malt tax, by weaning the people from the beer-shops, and attaching them to the farm-houses in which they were engaged, where they would, as they used formerly to do, receive their beer,

without the temptations to vice by which it was accompanied in the shops. (*Hear.*) There was no mode of checking this evil except by any abolition of the malt tax. Mr. Cobbett, in the course of last year, quoted from the evidence of a gentleman named Simmons, of Gloucestershire, who deposed before a committee that 14 out of 15 clergymen whom he had consulted, expressed their opinion that the best way to remedy the evil of the beer-shops was to repeal the malt tax. (*Hear, hear.*) But some gentlemen would assert that these hopes were chimerical, and that the labourers would not brew at home. He denied this. (*Hear, hear.*) His own labourers brewed whenever they had opportunity. He would beg the attention of the house to this one fact, that at harvest they commonly brewed their little *modicum* of drink, and the price of the malt obliged them to adulterate it with coarse brown sugar, instead of using that which PROVIDENCE had bestowed, and which had been cultivated with the sweat of their own brows. (*Hear.*) It was a well-known fact that labourers and workmen who resorted to beer-houses, returned, after partaking of the beverage they got there, besotted and infuriated. He recollected being told by a waterman on the Thames, that they dared not go into the beer-houses by the water side, for if they did, they would not be able to pull back against the tide. It was manifest the articles sold in these shops must be adulterated; for when the brewer sold the barrel at 38s, they undertook to sell it at 36s; and it was known to be a common practice with such persons, to make three barrels out of two. He could not say what ingredients were used by those retailers; but that they were destructive and injurious to human life there could not be the least doubt. (*Hear.*) It was, he considered, a most impolitic tax—it was a tax which interfered with science—a tax which prevented a man to walk from his cistern to his still unaccompanied by an Excise officer. (*Hear.*) He now came to a portion of the subject which his noble friend had treated lightly, and upon which it was not his intention to press strongly—he alluded to the financial part of it. He recollected that an hon. friend of his, the late member for North Devonshire, had, for the part he had taken upon this motion, incurred a great deal of obloquy, and lost his seat by it. Now it was not to be expected that he would run the same risk. (*"Hear," and laughter.*) He disclaimed the doctrine laid down upon this subject by Mr. Tierney and others, that he should not be prepared to vote away a sum of money on one description of taxes, unless he was prepared to substitute another; for as far as he was himself concerned, he was quite willing to support the proposition of the hon. member for Worcester, when he stated, that in any commutation of the taxes bearing upon the poor and the labouring classes, he was most willing to substitute a property tax. He was himself most willing to have the property tax; but that was a proposition which he was aware was by no means popular in that house. (*Hear.*) But was he to be told that they were so circumscribed in circumstances, that if there was a defalcation in the revenue, the right hon. gentleman would not be able to find the means of supplying the decrease. They could have no such fears when they saw on the right hand of the Chancellor of the Exchequer the President of the Board of Trade, who, in the discussion upon this question in 1833, told the house that "there was no reduction of taxation more likely to give relief than the reduction of the duty on malt," (*"hear," loud cheers, and laughter,*) and "if that

duty could not be spared, it could be easily transferred to some other articles." (*Cheers and laughter.*) He would not anticipate the speech of the right hon. gentleman in support of the motion of his noble friend. (*Cheers and laughter.*) He presumed that the speech which they would hear that night from the President of the Board of Trade would be most useful to the agriculturists, and it would prove to them that they had not lost their able advocate in their consistent friend. (*Cheers and laughter.*) If the malt duty were repealed, he believed the deficiency could be supplied. A just arrangement should be made in the letting of crown lands by auction, and not jollying them away in leases, as at present. If this were done the deficiency in the revenue would shortly be supplied. A tax should be imposed, too, at once, which had been given up by the noble lord the late Chancellor of the Exchequer—he alluded to the tax upon the transfers of stock. (*Cheers.*) For the life of him he could not understand that valid argument could be used against the imposition of that tax. He wanted to know why it was that, when he could not dispose of 5,000*l* worth of land without paying a heavy stamp duty, yet he could dispose of the same amount of stock without having any more to pay than the broker's fees? (*Hear.*) It might be said that imposing such a tax would be a breach of the public faith; but was not the property tax a breach of the public faith? (*Hear.*) Did it not now require three quarters of wheat to purchase the same quantity of debt which in its original value was equal to but one quarter? (*Hear.*) He looked upon a tax but as the insurance paid for the protection of property; and seeing that the agricultural interest was upon the brink of ruin, he asked was it not right that insurance should be paid upon the property in the funds? Let him not be misunderstood; for he would lend himself to nothing which could be regarded as a dishonourable breach of the public faith. He recollected when the hon. and learned member for Dublin was assailed with a burst of indignation in that house, when he upon one occasion spoke of "the cant of national faith;" and if by that the hon. and learned member meant that national faith was not to be maintained, the sentiment was one which should undoubtedly be repressed. (*Hear.*) But this he would ask, what was the value of national faith if they had not the national means to meet it? (*Hear.*) Mr. Pitt had at one time declared that the land was mortgaged to the public creditor. He did not mean to deny the mortgage; but he asked what would be the condition of the public creditor, if he were to attempt to go through the difficult process of taking possession of the land, where he would behold nothing but pauper parishes and uncultivated fields, for his lost dividends? It amounted to this, that either the public creditor must place in peril his entire mortgage—or, like other mortgages in private life, the interest must be reduced. (*Hear.*) He should not trespass further upon the attention of the house than to allude to one sentiment, which had fallen from his noble friend, who seemed to have risen under the apprehension that there was a possibility that gentlemen who had pledged themselves elsewhere would be found voting against him to night. (*Hear.*) Those hon. gentlemen whom he saw around him would not be influenced now by that which had occurred on a former occasion with Lord Althorp, the stale trick of a threatened resignation, (*"hear," and cheers,*) a threat which he knew was not very often carried into effect, and for which he had no apprehension at the present moment. (*Cheers.*) He knew that,

however easy it was for hon. gentlemen to change their opinions, it was not so easy for them to change their places. (*Cheers and laughter.*) But if gentlemen who voted for the repeal of the malt tax against the government of Lord Grey, notwithstanding that threat, should now vote the other way, he asked would not factious motives be attributed to that vote? Would it not show that by their vote upon that occasion, they were influenced by those factious motives which they were latterly so fond of imputing to others? (*"Hear," and cheers.*) But, though rumours were so rife, and he had no doubt that some of those connected with his noble friend believed them—yet he could not credit them. Some weeks ago they raised the cry of "measures not men"—they would be still true to their principles—not that they loved the measure less, but that they loved the men more. (*Cheers and laughter.*) He could not, for instance, suppose that there would be any retraction on the part of those who had pledged themselves; he could not believe, for one, that the hon. baronet the member for South Devonshire, who defeated his liberal opponent because he was so strenuous an advocate for the abolition of this tax, would do so. (*"Hear," and laughter.*) That hon. baronet, in addressing his constituents, after promising that if he should be honoured by becoming their representative in Parliament, he should devote himself to promote the welfare of the industrious classes, and then said he would look to the currency question and other measures; he promised to vote for "the repeal of that most oppressive and mischief-working impost the malt tax, which depresses the industrious classes, and promotes intemperance and immorality." (*Cheers.*) "For these professions I claim credit, because no one can convict me of broken promises, or of having belied my word." (*Cheers.*) He now asked, had not his noble friend been alarmed without any just cause? (*Cheers and laughter.*) Hon. members claimed the support of the constituency upon the exclusive title of their being "the farmer's friends;" and could it be thought that in a few short weeks they would forget their promises. He would ask was it possible that those gentlemen would act thus in that house? (*"Hear," and cheers.*) That those gentlemen should add to the despair of the already heart-broken farmers by betraying and deserting their cause? (*"Hear," and cheers.*) The professions of these gentlemen should now be submitted to the test; they would try their sincerity, and the division of that night would show who were and who were not the farmer's friends. (*"Hear," and cheers.*) He feared he had already trespassed too long upon the attention of the house, he now cordially seconded the motion of his noble friend. (*Hear.*)—Sir ROBERT PEEL said that the course which he proposed to pursue in regard to the discussion of this question, made him peculiarly anxious to rise at an early period in the debate. He did not wish to call attention to any matter mixed up with political or party interests, but to review the facts and arguments which had been adduced in favour of the repeal of duty on malt, in a calm and unprejudiced manner, and, if possible, to exclude the consideration of all subjects likely to excite prejudice, or to militate against what he conceived to be the best interests of the country. (*Hear, hear.*) It was because he sincerely hoped that the house was ready to listen and consider those facts and arguments—because he hoped that the question was not to be decided by political or party feeling, or in consequence of previously received opinions—because he hoped that the house would not omit

the consideration of all other classes of the community, nor select one class for relief without inquiry into the state of the other classes, but that they should sit as an unprejudiced jury upon the merits of the whole of this important question, that he asked them fairly to consider the evidence that had been adduced, and the arguments by which it was supported. (*Hear, hear.*) He was called upon to consider whether or not he should give his consent to a resolution which pledged the house completely and irrevocably to the total repeal of the malt tax. (*Cheers.*) He was called upon by his noble friend to consent to this resolution, at a period when the house had had no opportunity of hearing what the financial state of the country was—when it was not yet known what amount would be demanded for the public service of the country—(*Cheers*)—and before an opportunity had been given for any other class of persons to put in their claim for a share in the remission of taxes which it might be possible to make. (*Loud cheers.*) He was called upon to be a party to a resolution which irrevocably deprived the public revenue of the kingdom of several millions sterling. (*Cheers.*) If this were to be done—if it were possible to do it—he appealed to the house, if the proposition ought not to be brought forward, not at the present period, when nothing was known as to the amount which could be spared from the public service, but after the declaration of what was necessary—(*Cheers*)—a declaration which would necessarily be made at no very remote period. (*Hear, hear.*) It would become his duty to make that declaration as soon after the termination of the financial year—that is to say, after the 5th April next—as possible. But his noble friend the member for Buckinghamshire would not wait till that period. (*Hear, hear.*) No, he called on the house to set aside the consideration of all other classes, and to consider the propriety of coming to a resolution pledging it absolutely and irrevocably to the repeal of the malt tax. (*Cheers.*) It therefore became his (Sir Robert Peel's) duty to consider the arguments which he had brought forward, and to do the best he could to caution the house against the consequences of coming to a precipitate determination upon this important subject. (*Hear, hear, hear.*) He could not state with complete accuracy what the financial prospects of the future year were, but he could refer to the statement made last year by the noble lord the late Chancellor of the Exchequer. In the budget brought forward by the noble lord last year, after allowing for the deficiency which would take place in consequence of the repeal of the house tax, he made a calculation of the probable surplus on the year ending the 5th of April, 1836. The noble lord had stated the probable expenditure of the army for the present year at the same sum as that of last year, but he (the Chancellor of the Exchequer) had the great satisfaction of stating that he trusted it might be considerably reduced. (*Cheers.*) He thought that the expenditure of this year might be reduced by 407,000*l.* But although the noble lord had in that case miscalculated by overstating the expenditure, still in other particulars he had miscalculated by understating the amount required; and it was found that an increase of expenditure would be incurred in other departments nearly corresponding with the reduction which he had mentioned, so that, upon the whole, the calculation was not far from the truth. Now the calculation of the noble lord was, that, on the 5th of April, 1836, the permanent revenue would exceed the expenditure by the sum of

250,000*l.* He (the Chancellor of the Exchequer) did not think that he could calculate on a larger surplus than that stated by the noble lord—that was after making allowance for the 750,000*l.* to be paid as compensation to the West India proprietors, and for the deficiency consequent on the reduction of the house tax. In this state, therefore, with a surplus revenue of not more than 250,000*l.*, the noble lord asked the house to pledge itself to repeal the whole of the malt tax. (*Cheers.*) He believed that last year the gross produce of that tax was no less a sum than 5,150,000*l.* (*Loud cheers.*) In 1831 the net amount paid into the Exchequer, on account of the malt tax, was

|               |            |
|---------------|------------|
|               | £4,208,000 |
| In 1832 ..... | 4,675,000  |
| In 1833 ..... | 4,772,000  |
| In 1834 ..... | 4,812,000  |

Now, if he agreed to the noble lord's resolution, he would forego a certain and available revenue—(*hear, hear, hear.*)—knowing at the same time that there was only a surplus revenue of 250,000*l.*, and thus creating a deficiency in the amount required to meet the ordinary expenditure of 4,500,000*l.* (*Loud cheers.*) But the noble lord told the house, as an inducement to them to reduce the whole of this tax, that, by so doing, they should be able to get rid, as a matter of course they should, of the whole of the charge of collecting it. It was his opinion that there were very few taxes the charges of the collection of which were lighter than the malt tax. (*Hear, hear.*) It was difficult to calculate exactly what the expence of the establishment for the collection of any one tax amounted to, but it was easy to calculate how much of the general establishment could be got rid of if a tax were altogether repealed. Now he thought he could safely say, that if the malt tax were repealed, no more of the charge of collecting the taxes generally could be got rid of than 150,000*l.* Indeed he could say positively, that it would be impossible that the reduction could be more than 150,000*l.* (*Hear.*) Another material point to be considered in relation to the expediency of a tax was, its liability to be evaded by fraud. Now he could confidently say, that no tax by which a revenue of five millions would be realized to the public treasury, or any combination of taxes which was equally productive, could possibly be imposed which was less liable to frauds than the malt tax as at present collected. (*Hear, hear.*) He did not mean to say that some modification in the present mode of collecting the tax might not be introduced—that regulations might not be made by which malt might be employed without the present excise restrictions. (*Hear, hear.*) On these points he reserved his opinion for the present. But the noble lord excluded the consideration of these and all other points, by calling upon the house not to modify the present excise-laws, but to pledge it to the total repeal of the duty on malt. The noble lord and the hon. member (Mr. Handley) stated that no remission of the present tax had been made, while other taxes were reduced. Did the noble lord and the hon. gentleman know that in the year 1830 the duty on malt was considerably reduced? for although the reduction was of the tax on beer, yet that tax fell ultimately on malt. Now in that year the duty on beer was reduced by 35*s.* per butt. (*Hear, hear.*) The noble lord then called upon them to give relief to the farmers, because the agricultural interests were in a state of extreme depression, and because the prices of all kinds of agricultural produce had fallen in the market. He would ask the noble lord if that was the case in

regard to barley? (*Hear, hear.*) Could it be said that barley was lower in price than it had been during the last or the previous year? And was it not singular that when barley was higher in price in comparison with wheat than it had ever been known before, that he would seek to relieve the farmers by repealing the tax upon that article of produce which was highest in the market? (*Cheers.*) Wheat, which paid no tax, was low in price, while barley, which paid this large tax, was unprecedentedly high. (*Loud cheers.*) He had already said that the net amount of revenue paid into the Exchequer on account of the malt tax, was, in the year 1831, 4,208,000*l.*; in 1832, 4,675,000*l.*; in 1833, 4,772,000*l.*; and in 1834, 4,821,000*l.* Now if the tax was so very oppressive has is noble friend and the hon. gentleman would have them to believe, he could not conceive how malt should continue to yield this still increasing revenue, and still that barley should keep up its price. The price of barley was increasing, the quantity malted was increasing, and the amount of duty received into the Exchequer was increasing, and still they were told that this was a most oppressive tax. (*Cheers.*) He knew the answer which would be made to this statement. He knew it would be said, that it was very true that the price of barley was increasing, but that the cause of that increase was the late defective harvest. (*Hear and cheers.*) But it was quite clear, that if the defective harvest were the cause of the increase of price, that the quantity brought to market ought to diminish proportionably. But if he could show that the quantity of malting barley brought to charge since the last harvest had increased, did he not spoil that argument? (*Hear, hear.*) Now, he had this morning sent to the Excise-Office, and he called for an account of the quantity of British malt brought to charge from the 10th of October, 1833, to the 19th of February, 1834, in order that he might compare it with the quantity brought to charge between the 10th of October, 1834, and the 19th of February, 1835; and he had now the satisfaction of stating to the house, that on a comparison, he found that the rate of duty within the latter period had considerably increased, the increase being no less than 846,000 bushels of barley brought to charge. (*Loud cheers.*) It was said that the house ought, at all events, to pledge itself to relieve the agriculturist, and that that could only be done by the repeal of the malt tax. It was said that the reduction of the tax would be the greatest relief to the agriculturists, because there was a large diminution in the quantity of beer used on account of the tax upon malt. He admitted that if a comparison were drawn, it would be found that, in proportion to the population, the quantity of beer consumed had diminished; but the question was, did that diminution arise from the duty imposed upon it? It might have arisen from the undue operation of a tax—(*hear*)—or from the successful competition of other articles. (*Hear.*) Now the argument of the hon. member opposite (Mr. Handley) was rather singular. He said that the consumption of beer had diminished, while the consumption of tea, of coffee, and of spirits, had increased; and he relied on that circumstance as an argument for the repeal of the tax upon malt. Now he (Sir Robert Peel) relied on the same fact—on the increase of the consumption of tea, coffee, and spirits—for the diminution in the consumption of beer; but the hon. gentleman and he came to entirely opposite conclusions from the same premises. (*Hear, hear.*) The hon. gentle-

man said to the people of England, "You drink much more tea, much more coffee, and much more spirits than your ancestors used to drink; I am surprised that you do not also drink more beer." (*A laugh.*) Now, on the same premises, he would say, that it was because the people of England drink more coffee, more tea, and more spirits, and from a change in their habits, that they did not drink so much beer. (*Cheers.*) He would now state the quantity of beer consumed in England during the year 1722, a year in which more beer was drunk, in proportion to the population, than in any other. During the year 1722, when the population of England was six millions, the number of barrels of beer consumed was 6,090,000, being at the rate of about a barrel for each person. In 1833, the population was fourteen millions; there was no correct account for that year alone, but the quantity consumed on the average of that and the two previous years was 8,200,000 barrels. In 1722 the quantity of tea consumed in England amounted to 370,000lbs., or about an ounce to each individual. In 1833 the consumption of tea was 31,829,000lbs., or nearly two-and-a-half pounds to each individual. (*Cheers.*) Was it not notorious, that the use of tea had superseded the use of beer among all classes of the community—(*cries of "hear, hear"*)—in the same manner that the use of spirits and wine had superseded it. (*Hear, hear.*) In 1722, the quantity of spirits consumed was 3,000,000 gallons, while in 1833 it was 12,332,000 gallons. But the most remarkable increase was in the consumption of coffee. In 1760—for there was no earlier authentic account of the consumption of coffee—the quantity of coffee consumed in the United Kingdom was 262,000lb., or about three quarters of an ounce to each person; in 1833 the quantity was 20,691,000lb. or one pound and a half to each person. (*Hear, hear.*) Now, it was impossible that the quantity of tea and coffee could be increased, and the quantity of beer also; and as far as the morals and habits of the people went, he doubted much if they should be improving them by discountenancing the use of tea and coffee. (*Hear, hear.*) The duty on malt was only 2s. 7d. per bushel, or at the rate of 57 per cent. The duty laid upon West India coffee was at the rate of 63 per cent.; the duty upon port and sherry at the rate of 75 per cent.; the duty upon rum at the rate of 407 per cent.—(*hear, hear;*)—the duty upon English spirits at the rate of 333 per cent.—(*hear, hear;*)—the duty upon brandy at the rate of 627 per cent.; and the duty upon geneva at the rate of 930 per cent. How then could the hon. member say that an undue preference had been given to those articles over beer? (*Cheers.*) His noble friend had said that though the duty upon malt paid into the Exchequer was only five millions, that the nation paid sixteen millions more, which enormous profit, by some means or other, found its way into the pockets of the maltster. He did not exactly understand how this was made out; but it appeared strange to him that sixteen millions could be realised by any set of persons entering upon a speculation which was open to the whole world as well as to themselves. But, with respect to the difference between the prices of barley and malt, the hon. member for Oldham had stated on a former occasion—and the statement appeared to make an impression on the house—that when that duty was 20s. 8d., and the price of barley 25s., the price of malt ought to be 45s. 8d., while, in point of fact, it was 66s.; and the 19s. difference went into the pockets of the maltster. Now he (Sir R. Peel) had sent this day to Mark-

lane to inquire into the prices of barley and of malt, because he was desirous to ascertain the real difference between them, and the causes which gave such enormous profits to the maltsters. He found that the price of the best malting barley was from 36s. to 40s. per quarter—a good price that for barley. (*Hear, hear.*) Now if to the barley, which bore the highest price, namely, 40s., were added the duty, amounting to 20s. 8d., the price of malt, leaving no profit to the maltster, ought to be 60s. 8d. And what was the price of malt at Mark-lane this day?—It was 66s.—(*hear, hear*)—leaving a balance of only 5s. 4d. between the price of the barley and the price of the malt. Now, after the expense and trouble which the maltster was put to, he did not think that 5s. 4d. would be considered too much profit for him to put in his pocket. (*Hear.*) Then the noble lord and the hon. member referred to other advantages which farmers would derive from being able to malt inferior barley, because if it would not be sufficiently good for beer, it would do admirably for the purpose of feeding cattle. He had the satisfaction of being able to refer to an order of the Board of Excise on this subject, to which he was anxious to give every publicity. It was not necessary that the barley should undergo the process of malting to render it fit food for cattle—wetting or steeping the barley was found amply sufficient for all the purposes of this nature. The order of the board of excise was of the date of 1827, and stated that the practice prevailed to a considerable extent of steeping barley in water for the food of cattle, and directed the attention of the several officers of excise to see that the revenue was not injured thereby. It directed them to take notice of the persons who adopted this practice, but not to interfere unless in cases of well-grounded suspicion of attempts to injure the revenue.—This order was intended as a public notice that there would be no interference, on the part of the excise, with the steeping of barley not intended for the kiln or oven—that was, provided that it was intended for the food of cattle. (*Hear.*) The next argument that was used was, that the repeal of the duty on malt would enable the poor man to brew his own beer. The principle of this argument appeared to him to be exceedingly weak; for what inducement would the poor man have to brew his own beer, when the malt tax was removed, that he had not at present? He could now buy his malt, and, with his malt thus bought, he could brew his own beer. If the duty on malt was reduced, or rather abolished, the great maltster would be enabled to enter into competition with the poorer manufacturer with as much advantage as at present. If there would be a temptation on the removal of the malt tax for the poor man to brew his beer, why did he not do so when the duty on beer existed? (*Hear.*) That tax, be it recollected, was only paid by the brewer, and the poor man who brewed his own beer did not pay any duty of the kind. Then did the practice of the poor man brewing his own beer prevail to a greater extent than at present? (*Hear, hear.*) He (Sir Robert Peel) warned country gentlemen against being led away by such an assumption. Let them not repeal a tax producing five millions a year under the delusion that by so doing the poor man would be induced to brew his own beer. (*Hear, hear, hear.*) Similar motives would operate—the same inducements would continue—on the poor man to go to the beer shop, when the malt tax was removed, as existed at present. (*Hear, hear.*) It was stated that the poor man

who bought his beer at the beer shop paid more for it than if he brewed it at home, and that he was induced to take a larger quantity in consequence of his being away from his family. It should be recollected, however, that there was something in the good fire at the beer shop, and the chance of meeting with company, which, under any circumstances, would continue to induce the poor man to pay the additional penny for his pot of beer. (*Hear, hear.*) If even they took off the whole of the malt duty, this inducement would remain as strong as ever, for he found on calculation that the repeal of the malt tax would not make a difference of more than a half-penny in the price of a quart of beer. (*Hear, hear.*) The hon. gentleman referred to other taxes, which he thought might be substituted in the place of the malt duty. Now, he could not help cautioning the hon. member to take warning from the treatment experienced by his late colleague, the late Sir W. Ingilby—(*loud laughter*)—he meant the late member for Lincolnshire. That honourable baronet, with the view of meeting the popular feeling in the county which he represented, proposed the repeal of the malt duty, and also opened a budget, in which he recommended the substitution of other taxes in lieu of it; but notwithstanding his strenuous exertions to get rid of the one tax, he could not destroy the hostility which was raised against him on his proposing to substitute other imposts. (*Laughter, and cries of "hear, hear."*) The hon. baronet to whom he had just alluded, who had assumed for one night the character of Chancellor of the Exchequer, because, as the representative of an agricultural county, he had touched on the substitution of other taxes in the place of the malt tax, and notwithstanding his frequent advocacy of the repeal of this tax, lost his seat. (*Cries of "hear, hear," and laughter.*) Let country gentlemen, therefore, take warning, for that would be the case with any man who proposed the imposition of new taxes to the amount of five millions a year in lieu of that which they now were so anxious to remove. (*Loud cries of "hear, hear."*) In his opinion, also, the argument that great advantages would result to the agricultural interest from the repeal of this tax, was not well founded. (*Hear, hear.*) Would the repeal of this tax be of general advantage to the agricultural interest, or only of partial advantage? Admitting as he did, that the agricultural interest was distressed, the question then was, whether the occupiers of the light soils, or barley growers, suffered more than the cultivators of clay lands—that was, the growers of wheat. (*Cries of "hear, hear."*) The only advantage which the hon. member for Lincolnshire or any other hon. gentleman could state, that the owners or occupiers of the heavy soils could derive from the repeal of the malt tax was, that it would force a portion of the clay lands into an unnatural cultivation, and make persons grow barley on those farms which now produced wheat—(*hear, hear.*) He was justified, therefore, in saying, that so far as the agricultural interest was concerned, the repeal of the tax would not be generally beneficial, but only partial in its operation. Supposing, therefore, that there was an available surplus of revenue at his disposal, would it not be more advantageous for the agricultural interest that it should be apportioned in such a way as to relieve it from the burden of certain local rates or charges which fall heavily on the land, than by any equivalent reduction in the malt tax?—(*hear, hear.*) He merely put this as a possible case; and he would appeal to the house,

whether, by pursuing such a course, the advantage would not be more equally distributed among the agricultural interest than by the course now recommended. Indeed he could not help thinking that the agriculturists would find on experiment, that if they succeeded in getting the tax repealed in the way now proposed, they would be exposed for some time to great detriment. At present, from the mode in which the duty on malt was paid, considerable advantage resulted to the producer, and the manufacturer of malt was often enabled to go into the market and receive the price of it before he paid the duty. It would be found that something like a capital of three millions belonging to the public was left in the possession of the manufactures of malt for the encouragement of that branch of industry. By the employment of this capital, the small manufacturer was enabled to enter into competition with the rich maltster. The consequence of the repeal of this duty, it was said, would be, every man would be able to make his own malt; and the hon. member for Lincolnshire argued from this, that there would be a great increase in the consumption of barley. Another circumstance of no small consequence would result from this. If any man was allowed to manufacture malt, there would be an enormous increase of illicit distillation. The process of making malt was dilatory and slow, and it could not be carried on to any extent in secret. The process of distillation from malt, however, was of a very different nature, and could be carried on with rapidity, and with comparatively little difficulty. If, therefore, the manufacture could be carried on to any extent, the inevitable result would be a great increase of illicit distillation. The amount of the duty on spirits would be diminished to a corresponding extent. Thus the revenue would be seriously injured, and at the same time agriculture would not derive any considerable benefit from the repeal of the malt tax, as had been supposed. He could not help saying that the adoption of such a resolution as had been proposed was more calculated to embarrass trade, to suspend all trade in the market, and to produce more injury to the farmer than any other that could be adopted—(*hear.*) His noble friend, for the purpose of protecting the agricultural interest, and of removing the depression under which it laboured, proposed to adopt such a course as would inevitably have the effect of throwing the malt trade into a state of the greatest confusion for some years. (*Cries of "hear, hear."*) After to-night all transactions would be suspended for some time in that branch of trade if the resolution was adopted, as no person would go into the market until he was fully satisfied as to the course that was to be pursued. He ventured to assert that the immediate effect would be to depreciate the price of barley at least 4s. or 5s. a quarter. Supposing that half the malt tax was taken off on the 10th of October next, and the remainder on the 10th of October, 1836, the brewers and maltsters would suspend their operations, well knowing that they would be able to make malt for brewing beer without the payment of any duty; and what would be the situation of the trade, so circumstanced, in the intermediate time? But, supposing the house determined to overlook this, and adopt this resolution—what course did his noble friend intend to propose they should pursue? There was only one of four courses that could be adopted. In the first place, they might increase the duty on other articles of general consumption; or, secondly, they might resort to a property tax (*hear, hear*); or,

thirdly, they might trust to the reduction of the public establishments to make up the deficiency; or, fourthly, after making the deficiency, they might do nothing. He would first take the reduction of the establishments, and he would ask any man, after the reductions made in them during the last few years, and in the last year to the amount of 500,000*l.*—after the efforts of the late government and the exertions of Lord Althorp to reduce them within as narrow limits as was practicable with respect to keeping up their efficiency—if it was possible out of the present establishments to make reductions available in the slightest degree for the purpose proposed. (*Hear, hear.*) Looking to the various interests of the country—to the state of the West Indies and the other colonies—and above all, looking to the reductions already made in the naval and other estimates, he was satisfied that no man could honestly give a vote for a reduction in the revenue to the amount of 4,600,000*l.* a-year, and hope for a reduction in the estimates by any thing like that sum. (*Hear, hear.*) There was a reduction in the estimates of last year to the amount of half a million, and it was extravagant to suppose that a similar reduction could be made immediately. It might be said that the deficiency might be supplied by imposing equivalent taxes on other articles of general consumption. He would caution the house against increasing the duties on spirits or other articles of daily consumption, and expecting to gain an equivalent increase of revenue. The honourable member for Lincolnshire suggested an increase of the duty on spirits as a means of relieving the agricultural classes. Spirits in this country were chiefly made from malt and corn. The imposition of the duty of 1*s.* a gallon on spirits, would be equivalent to imposing a duty of not less than 16*s.* a quarter on the malt thus consumed. The duty on spirits previous to last year in Ireland was 3*s.* 6*d.* a gallon, and at present the duty was 2*s.* 6*d.* a gallon. Was it proposed to raise the spirit duty in England, and not in Ireland? In England the duty was 7*s.* 6*d.* a gallon, and in Ireland only 2*s.* 6*d.* The disproportion was so great, that if the duty on the former was raised higher, the inducement to smuggle spirits from Ireland into England would be increased to an almost insurmountable extent. Again, after the reduction made last year of 1*s.* a gallon on Irish spirits, the house would hardly again be prepared to raise it to 3*s.* 6*d.* a gallon. But what had been the effect in Ireland of this reduction of duty? He had made a point of inquiring, and he had found that the effect of the reduction of the duty from 3*s.* 6*d.* to 2*s.* 6*d.* had been to lead in a corresponding period, with the reduction of duty, to an increase of one million of gallons brought to charge for the payment of duty. (*Loud cries of "hear, hear."*) He was quite sure that by raising the duty on spirits beyond the present amount there would be a great increase of smuggling, as well as an alarming increase of illicit distillation, which in its result would be extremely injurious to the agriculturists. It ought also to be borne in mind, that as chemical knowledge increased and spread, the illicit distiller was afforded greater advantages in carrying on his trade, while equivalent means of detecting frauds were not discovered. It was, therefore, necessary to take care before they increased the duty—however popular such a proposition might be—that they did not lead to a reduction instead of an increased revenue. There was no doubt but that spirits should bear as high a duty as could consistently be imposed on them, but the moment they raised it to a certain height, they

held out a premium to the illicit distiller, and at the same time sacrificed the revenue, and injured agriculture, by holding out an inducement to distil from other articles. He believed, therefore, that the house was not prepared to have recourse to this means of supplying the deficiency. But they had been told that if they reduced the malt tax they might impose a property tax. When the subject formerly came before the house, they had an available resource of 1,500,000*l.* It was then proposed to repeal half the malt tax, and the house and window taxes. At the period when there was the surplus of 1,500,000*l.* the house came to the following resolution:—"That the deficiency of the revenue which would be occasioned by a reduction of the tax on malt to 10*s.* a quarter, and by the repeal of the taxes on houses and windows, could only be supplied by the substitution of a general tax on property, and would occasion an extensive change in our whole financial system, which would at present be inexpedient." He prophesied that if they got rid of the malt tax, they would, before resorting to a property tax, try what they could do in other ways. Could the country gentlemen of England tell what they would gain by imposing a property tax in lieu of the malt tax? (*Laughter, and cries of "hear, hear."*) They should recollect that a property tax would not fall on the profits of the tradesman, nor on professional incomes, but it would be on the land. (*Hear.*) Then, indeed, they would have reason to repent having, while sitting in judgment on the subject, imposed a property tax in lieu of a duty on malt. (*Loud cries of "hear, hear."*) Then they would repent having tried the bone of a property tax—(*laughter*)—whether graduated or not in lieu of the malt tax. (*Hear.*) He called upon them to act that night as an impartial jury, and he believed there was no other prospect for the landed interest than the imposition of the tax alluded to. They might have promised their constituents that they would exert themselves to get this tax removed, but they might depend on it that if they opposed the motion on the grounds which he had urged, their constituents would, on the appeal being made to them, be convinced of the propriety of the course they had taken for the permanent benefit of the agricultural interests. (*Loud cries of "hear, hear."*) The noble lord said that the extent of advantage to a farmer of 250 acres would be between 70*l.* and 80*l.* a-year from the repeal of the tax. He did not believe that on the average a farmer consumed more than a hundred bushels of malt; but by his noble friend's calculation, he must consume five or six hundred bushels. The honourable and learned member for Dublin had stated with great fairness, on a former occasion, that if a property tax were imposed, it must be levied on all his Majesty's subjects, and that Ireland must bear her proportion of the tax. He begged the gentlemen of Ireland to reflect whether their situation would not even be worse than that of the occupiers of clay soils, if they substituted a property tax for the malt duty. (*Hear, hear, hear.*) The amount of the malt duty in Ireland was, last year, 246,000*l.*, and were they prepared to exchange this for a property tax? He need not say what would be the difference to the people of Scotland and Ireland if they carried the repeal of the malt tax; and he would venture to say any attempt to enact other taxes or duties to the amount of that repealed, would lead to difficulties which would be found insurmountable. (*Hear, hear, hear.*) He need not say what would be the result if they were to make the reduction, and at the same time take no

steps to supply the defalcation in the revenue. By the maintenance of the public credit—by a strict observance of the rules of good faith, the country had been enabled to gain considerable advantages, and of such a nature that they could obtain by no other course. Since the year 1822 we had been enabled to maintain a price of our securities at such a rate, by not suffering any object to interfere with upholding the public credit, that we had been enabled, by making new arrangements with the public creditor, to effect a saving in the expenditure to the amount of 2,340,000*l.* per annum. (*Hear.*) We had been able to obtain this advantage because we had always maintained the public faith; and he had no doubt we could continue to pursue the same course with similar advantage. At present the three and a half per cents amount to 250,000,000*l.*, and although not immediately, at a period not very remote, they might be paid off at par. (*Hear, hear, hear.*) They had thus experienced the value of the high honour and good faith of the country, and he would warn honourable gentlemen not to lose the advantage of the superior character of the country for integrity, but as they had already obtained the remission of taxes and the reduction of the public burdens by pursuing this career, not now to forfeit the probability of a similar result, by losing their fair fame in the world. (*Hear, hear, hear.*) He trusted the house would not again involve itself in those contradictions and those vacillations which had been the consequences of the course taken on former occasions. The history of this very malt tax was pregnant with lessons of warning. (*Hear, hear.*) On three different occasions they had retraced their steps. In 1816 they took off part of the duty in the hope that there would be some great correspondent reduction in the price. In this being disappointed, however, in 1819 they replaced the duty they had so taken off. In March, 1821, the house determined, by a small majority, to repeal the malt duty; but in one month after, in April, 1821, it rescinded its own decision, and re-established the duty it had repealed. They did the same thing in 1832. By a precipitate vote, adopted in the enthusiasm of the moment, they passed a resolution with a view to the repeal of a portion of the duty, and on the following Monday they retraced their steps. Certainly it was better to do that than to persevere in error. (*Hear.*) But let them not again subject themselves to the imputation of that vacillation which was the least of the evils, for in his conscience he believed they would have to re-establish the malt tax. (*Hear, hear.*) It was in order to rescue Parliament from such a difficulty that he asked them this night to vote against the resolution of his noble friend. He felt so confident that the force of reason would prevail—he felt so confident, that with a surplus of only 250,000*l.* they would not cause a deficit of 4,600,000*l.* in the hope of supplying it from other sources, that he never would listen to those who told him to despair, or do so much injustice to the house as to believe that they would come to a vote so rash and so detrimental to the interests of the country. (*Hear, hear.*) He was still of that opinion. He believed that the representatives of the landed interest, and the representatives for Ireland, foreseeing the consequences of a property tax, would retain the power of judging for themselves, their constituents, and their countrymen, whether it would be the wiser course, as statesmen, to retain the malt tax, or to force the consequences inevitable from pursuing a different course. That he believed to be the duty of the house, and he trusted that the result of this

night's division would not show that his confidence in its judgment and integrity was misplaced. (*Cheers.*) But whatever the determination of the house might be, of one fact he was sure, that with his views of the consequences of the repeal of this tax in the present state of the public revenue, he had no alternative but to submit his views to the consideration of the house, and if the house chose to overrule them, to leave it subject to the responsibility which it would assume. (*Cheering.*)—Mr. COBBETT urged the house not to be deterred by the intimation that the right honourable gentleman would resign, were he left in a minority on this question, from giving their support to the motion of the noble lord.—Mr. J. BENETT said, that the right. hon. baronet had appealed rather singularly to the Irish landholders. The majority of the land in that country, and a great portion of that in England and Scotland, were in the hands of mortgagees, a class of persons who were for the most part taxeaters and not taxpayers, and who the sooner they were taxed for the benefit of the State the better. He considered the substitution of a property tax of greater moment than the repeal of the malt tax, and to that substitution he believed they must come. In his opinion, the only equitable mode of taxation was to apportion it according to the property possessed, and not according to consumption. Taxation was understood in this country to be for the protection of property; but instead of men being taxed in proportion to the amount of property they possessed, by the present system, under which articles of consumption were taxed, men were made to pay according to what it was necessary for them to consume. The right hon. gentleman told them, that if a tax were laid on spirits to the amount of one shilling, the consequence of the increased price would be, that greater encouragement would be given to illicit distillation. The reduction of the duty on malt would have the effect of lowering the price of barley; and the result would be, that if to make good the deficiency, spirits were to be subject to an additional tax of one shilling, the cheapening of the barley would reduce their price two shillings; therefore, there was no reason to fear any increase of the temptation to illicit distillation. The right hon. gentleman had made another statement that was not quite correct. He had given them to understand, that the heavy lands would not benefit by the repeal, inasmuch as on them principally wheat was grown. Did not the right hon. gentleman perceive, however, that the light soils, on which barley and wheat were now both grown, would, after the repeal, be used entirely for the growth of barley, and wheat would be confined to the clay soils? He did not, however, see that the repeal of the malt duty would much benefit the landed interest; and he considered it, therefore, of comparatively small importance to that interest; but he begged to tell the right honourable gentleman, that it forced the labourer to consume, for ten months out of the year, water instead of beer. The right hon. gentleman had quoted 27*s.* as a high price for barley; but the fact was, the price was low. The crop of last year did not amount to one-half of an average crop. But the right hon. gentleman might tell them that the consumption was equal. This proved, however, that the consumption was by the rich, and not by the poor; the poor were not able to consume it at such a price. What he desired was, to make beer cheaper than spirits. It was because the labourer was not able to brew at home that he went to the beer

shops, which had increased, and was induced to stay out at night, and waste the means that more properly belonged to his family. He contended that, whatever might be the result of benefit to the farmer, by an increase in their comforts or supply of their necessities, that benefit would eventually extend to the landlord, for the interests of all classes were intimately connected. The time was, when a large number of landlords were not distressed; and now, during the maintenance of the malt tax, they had been obliged to reduce their rents 30 or 40 per cent., which showed the effect of the malt tax not to be one of unmixed good, and he therefore called upon them to assist in reducing it. (*Hear.*) — Lord DARLINGTON thought the malt tax bore oppressively on the agricultural interests, and in their present great distress any opportunity should be seized of affording them every sort of relief; nor would this be relief alone to those classes, but would extend itself to manufacturers, artisans, and labourers. He was aware of the opinions of his right hon. friend the Chancellor of the Exchequer, on the serious loss that would be sustained by the revenue. But he did not see it was any argument that an unjust tax should be continued, when a good substitute could be procured. The time had arrived when every vexatious tax should be removed, though he was ready to admit a difficulty after the amount of taxes already remitted. When demands were made for relief from taxation, he thought there were none better entitled to consideration than the agricultural classes, which now endured the greatest distress. They had in times of the greatest distress borne it with exemplary patience; they had, on all trying occasions, offered testimonies of loyalty and devotion to their country, and had always been the first to maintain, in times of difficulty, order and good government. It was not the agricultural classes alone that would benefit by this repeal. It was the interest of the whole community. There was no single tax that could be taken off that would afford such general relief. If the tax were taken off the public would gain about one-fourth; they would gain 2s. 3d. in each 10s. 7d. He had long entertained these opinions as an honest man, and as a faithful representative he would support the motion.—Mr. C. WOOD would not be tempted by the allusion which had been made by hon. members imputing factious motives to gentlemen on his (the opposition) side of the house, and the best refutation that he could give to it was the vote that he intended to give in support of ministers on this motion. He was not insensible to the distress of the agricultural interests. Deriving, as he did, his income exclusively from land, if he took a course against the repeal of the malt tax, he could not be accused of any want of sympathy for the agricultural interest; but he believed the benefit of its repeal would be so small as not to be put in competition with the loss to the revenue. It was well known that taxes on consumption were chiefly paid by the poorer classes, unless made so high as to cause them to be diminished; and he would refer to the Chancellor of the Exchequer to prove that the consumption of beer had not diminished. If, therefore, the tax were paid by the consumers, its repeal would give small relief to the agriculturists. The relief would be extended to that portion of the community which did not stand in need of it. Little relief, therefore, would be given, and if his noble friend (the Marquis of Chandos) would wish to give relief to the poorer classes, he might give much greater by taking off other taxes. For

instance, taking taxes off the raw material of our manufactures would extend employment and increase wages. He would not go through the substitutes mentioned by the Chancellor of the Exchequer. He thought his statements were important. He thought the only possible substitute was a property tax; and when he looked back to the year 1816, and the opinions and difficulties that then existed, he came to the conclusion that those who now call for a property tax would be the first to object to it. He would warn hon. gentlemen, by the example of last year. He hoped that hon. gentlemen, however pledged — (*hear, hear, and laughter*)—would not now place themselves in a similar difficulty. He was aware of the advantages which the pledges of hon. gentlemen on the ministerial side of the house had given them over their liberal opponents; and he knew it was difficult to show the world the fallacy of their intentions, or that the advocacy of the repeal of this tax did not mean exclusive loyalty to the king, or religion, and that it was not for the benefit of the farmers and agricultural interest, but to serve their turn at the elections, and for party purposes. (*Hear.*) Though difficult, yet looking to the consequences, and confessing he had at heart a desire to maintain the national faith, it would not be wrong to break their promises. Those of the ministry who had formerly voted for the repeal, and had accepted office, had a sorry choice—they must differ with their colleagues, or they must have reason for their change. (*Laughter.*) If there were any for whom such a course appeared more difficult than others, perhaps he might instance the right hon. baronet the Paymaster of the Forces (Sir E. Knatchbull), the long-tried and consistent advocate of the agricultural interest in that house. (*Cheers.*) He did not know that it would add to the deference which he hoped all the interests in the country would be ready to pay to the decisions of the Board of Trade—(*hear*)—when they found that the right hon. gentlemen the President and Vice-President were prepared on the present occasion to reverse their former votes. (*Hear.*) From any one but the right hon. member for the county of Essex (Mr. Baring) he should not have been prepared to expect such a change; but when he looked back to the conduct which that right hon. gentleman pursued in 1833, when he found that on the motion for a repeal of the malt tax he put his own principles aside, and, to quote his own words, dealt with the then ministers according to their principles, as he was pleased to attribute to them, he could not but expect that he would now do as much for his friends as he had done for those to whom he was opposed, and that he would on the present occasion, as then, put his principles aside, “content with what he could get in the scramble”—(*loud cheers and laughter from the Opposition*)—and adopt, for the night at least, the principles of his colleagues (*hear, hear.*) But, however that might be—whatever might be the motives which actuated those right hon. gentlemen to whom he had alluded—he (Mr. C. Wood) was prepared to give his Majesty’s Government the support of an honourable and not a factious vote. (*Cheers.*) But of whatever materials the majority of the evening might be composed, he sincerely hoped the decision would be, not to sport away so large an amount of revenue, but to take care that in the result they left unendangered and unimpaired the national faith and honour of the country. (*Loud cheers.*) — Sir E. KNATCHBULL said, after the personal appeal which had been made to him, he should be wanting in his duty to

himself, in his respect to that house, and to the country at large, if he did not avail himself of that opportunity to make one or two observations. The hon. gentleman had asked whether, having on a former occasion voted in favour of the repeal of the malt tax, he (Sir E. Knatchbull) was now prepared to reverse that course? Before having made any charge, the hon. gentleman would have done well to have first ascertained what was the course which he (Sir E. Knatchbull) really had pursued. In 1833, he had undoubtedly advocated the repeal of the malt duty. He had been then, and he still was, of opinion, that the remission of that tax would confer considerable benefit on the agricultural interest of the country. But the house would not fail to recollect that at that period, when he supported that view of the subject, there was a considerable disposal surplus of revenue ("hear, hear," and "no, no"), and to that he looked when he gave his vote. (*Hear, hear, hear.*) He then came to the vote which he was represented as having given on the occasion of Sir William Ingilby's motion; but on that occasion he took no part whatever. At the present moment there was only a surplus of 250,000*l.*, and under those circumstances his present course was perfectly consistent, and he was sure, therefore, the vote he gave would be satisfactory to the hon. gentlemen on the other side of the house. There was another point on which he wished to say a word before sitting down. Without entering into questions of detail as to how far the agricultural interest would be benefited by the repeal of the malt tax, one thing was obvious to all—that a substitute must first be provided before so large a sum could be dispensed with; but it was worthy of consideration that the actual deficit would be much more than 4,600,000*l.*, because the necessary effect of the increased consumption of untaxed beer throughout the country would be, that in other articles, such as tea and coffee, there would be a simultaneous proportionate defalcation in the revenue. He thought that his Majesty's government, by adopting their present course, were doing that which was most conducive to the maintenance of the honour and public faith of the country. (*Hear, hear.*)—Mr. S. RICE could not on the present occasion be content to give a silent vote, connected as he had been with the late government. Acting under different circumstances than when the question formerly came before the house, he yet would consider he would be acting improperly if he did not take his stand against the repeal of the malt tax, as he had done on former occasions. Noble lords and hon. members might indulge in attributing motives of faction to votes given on his (the opposition) side of the house. He would not follow their example; he would not deal out, in the absence of hon. gentlemen, the hard language which had been so profusely used; he would not use offscourings of party, and the sweepings of a pulic office. (*Loud cheers.*) He would ask whether the imputations against the late ministry, which were contained in the speech of the right hon. the member for Kent to his constituents (Sir E. Knatchbull) were such as should have been made? The right hon. gentleman had upon the hustings been pleased to denominate the late government, to which he (Mr. S. Rice) felt proud to have belonged, as the "offscouring of party, and the sweepings of office." (*Laughter and loud cheers from the opposition benches.*) He would take the liberty of saying, that from those who were denominated by the right hon. gentleman as the "offscourings of

party, and the sweepings of office," he and his friend the right hon. baronet should that night receive the most disinterested and honourable support. (*Loud cheers.*) He felt deeply interested in the decision to which the house would that night come; and he was the more interested in the decision of this question, because he had not forgotten the arguments similar to the taunt of the noble lord (Darlinton), which had been used by those who sat upon the Treasury benches, against any combination upon particular questions of individuals, or parties who might have occasionally or frequently differed in opinion upon political subjects. (*Hear.*) There was no one within the walls of that house who looked forward with more cheerful anticipations to the result of the vote upon this question, and there was no one who entertained more sanguine anticipations that the right hon. Baronet's resolution would be sanctioned by a large majority—a majority, too, which he felt convinced would vindicate the character of that distinguished party to which he was proud to belong, from all the imputations of acting entirely from factious motives, which had of late been so frequently urged by those who sat on the Treasury against those occupying the opposition benches. (*Cheers.*) How, he would ask, could those who advocated such a principle—who maintained that a difference in political views upon certain questions, precluded the possibility of men or of parties voting in the same way upon any subject—now come forward and claim his and the votes of his hon. friends in support of a government in which they had no confidence, upon a question the majority upon which must be decided by their votes? (*Cheers.*) He, however, altogether differed from those who laid down that principle as the guide by which the conduct of public men should be directed, and he therefore felt no hesitation in giving to the right hon. baronet opposite, his cordial, earnest, and sincere support upon this question. (*Cheers.*) He was the more anxious that this fallacy should be exposed as speedily as possible, because he knew that there were many hon. members who would vote against the motion of the noble lord, if they were not deterred from doing so by a fear that if they acted in that manner they would be affording support to a ministry whom they distrusted. (*Hear, hear, hear.*) Those gentlemen ought to forget everything but the principles laid down in the speech of the right hon. baronet; and as these coincided, he believed, with their opinions, they ought not to hesitate to give him their support. (*Loud cheers.*) The right hon. gentleman had argued the question in so clear, convincing, and conclusive a manner, that no one who could understand the force of reasoning, or the application of facts, could fail to be persuaded of the expediency and justice of the course which he had recommended to be pursued. (*Cheers from the ministerial benches.*) He, for one, could fearlessly assert that his vote should not be dictated by any factious opposition to the administration; and the arguments of the right hon. baronet, which comprehended, or rather decided the whole question, strengthened and confirmed the conviction at which he had previously arrived. (*Hear, hear.*) He wished to say this, not only because he had been a member of that government, which upon previous occasions had resisted a similar proposition to that of the noble lord, but because he felt bound to declare that if he had never voted at all upon this subject—if now for the first time the question was broached, still, upon the grounds stated by the hon. baronet, he would never con-

sent to sacrifice so large a portion of the public revenue as that which must result from a compliance with the motion of the noble lord. (*Loud and continued cheers.*) It would not be safe to adopt such a course, even if there was a fair chance of finding a substitute for the tax which was proposed to be abolished; but was there, he would boldly ask, a single individual within the walls of that house, who could reckon, with any approach to confidence, upon the possibility of finding a substitute, if the malt tax were repealed? (*Continued cheers.*) There was a subject closely connected with the object of the present motion, which he was surprised had not been alluded to in the course of the debate. The question to which he referred was that of the corn laws. (*Hear, hear, and cheers.*) Before hon. gentlemen committed themselves on the present motion, he thought it would be well if they were to recur to their votes upon the question of the corn laws; or, at all events, read the arguments which had been used on that occasion, and consider how many of them urged against the repeal of those laws rested upon the fact of the land being subject to many and peculiar burdens. (*Hear hear.*) With what grace could those country gentlemen who should vote for the noble lord's motion, which went to relieve the land from one of the peculiar burdens which now pressed upon it, come down to the house and vote against the motion, by which it was intended to deprive the landowners of that monopoly which could be defended only upon the ground that they were exposed to severe and peculiar hardships? (*Hear hear.*) It was only yesterday that a petition was presented, containing the modest request that the house would grant the total abolition of the malt tax, and a great increase in the protecting duties on foreign corn. (*Laughter and cheers.*) The Right hon. gentleman (Sir Robert Peel) had adverted to the reductions which had already been effected in the duty upon malt; but in doing so he had only compared the present state of the duty payable on malt, with that which existed previous to the passing of the beer bill. Let the house, however, observe the reductions which had been effected previous to the periods to which the right hon. baronet had directed their attention. Now from the year 1804 to 1817 the duty on the quarter of malt was 36s 7d; and up to the year 1830, when the beer bill was passed, the duty on the same quantity was 22s 7d. And the maximum of the diminutions which had been effected during those periods, amounted to 25s 11d the quarter. This was an additional argument against the reduction of that branch of taxation which was said to press with such severity upon the land. He could have no doubt as to the result of the division; he could entertain no doubt that in resisting the proposition of the noble lord, the late government would prove that they were swayed in their conduct by no factious motives, but were directed alone by an attachment to those principles which they had formerly professed. (*Cheers from the opposition, in which the ironical hear hear, of Mr. Cobbett was heard when the other members ceased cheering.*) The only ground of alarm which the ministry could reasonably apprehend referred to the pledges which had been given on the hustings. (*Cries of hear, hear.*) He believed that these pledges had been honestly given in some instances: it was impossible that some of them also had been given in ignorance; (*loud cries of Oh, oh, and laughter.*) but this he felt was an excuse which could not be fairly pleaded by those who were now about to vote against the motion of the noble lord, in the

teeth of those pledges which they had given to their constituents on the hustings. (*Cheers.*) This was no new subject. Gentlemen who aspired to become members of parliament had a right to understand what the malt tax was; and when men of character, station, and independence came forward as candidates, and refused to pledge themselves to a measure which they saw no possibility of being carried into execution, those who defeated them had no right, consistently with an adherence to justice and political truth, to carry the elections triumphantly by having inscribed on their banners "No Malt Tax," and afterwards, when they come to vote in parliament, plead ignorance of the nature of the pledge by acceding to which they had succeeded in obtaining their seats. (*Loud and continued cheers.*) The delusion on the subject of the malt tax was, previous to the last election, extended throughout the country. (*hear.*) The Whigs, that party with which he had always the honour to act, were stigmatized as the enemies of the farmers, and their opponents lauded as their steady and faithful friends. (*hear, hear.*) In noticing the delusions which prevailed upon this subject, he could not help referring to the circular which had been put forth by the supporters of the right honourable baronet previous to the last election, and which claimed the support of the farmers at the approaching election in the favour of those who styled themselves their steady and sincere friends. It was in these words: "Farmers of England! look to your Representatives!—Recollect a Knatchbull for Kent (*laughter and cheers.*) out of office, voted for the repeal of the malt tax; a Baring, for Essex, out of office (*hear and cheers.*) voted for the repeal of the malt tax; a Lincoln, for Notts, out of office, voted for the repeal of the malt tax; an Ashley, for Dorset, out of office, voted for the repeal of the malt tax; Murray, for Perthshire, out of office, voted for a repeal of the malt tax!! Farmers of England! look well to these official gentlemen, and now they are IN OFFICE, take care they do not change their votes; but let them prove their consistency as Lord Chandos has done, by voting with him as they did before." (*Tremendous cheering.*) He did not wish to have it supposed that he was anxious to pin hon. members to the opinions which they had pronounced on the hustings, (*laughter.*) he, on the contrary, hoped that they would act in that manner in which their consciences dictated, and trust to the good sense and judgment of their constituents for an exculpation of their conduct upon this question. (*hear.*) The right hon. member in conclusion, expressed a hope that no man, however humble his station, would fail to fulfil that duty which he owed to his country—never to countenance any measure which tended to weaken the national integrity, and to prevent the maintenance of public faith. (*Loud cheers.*)—MR. A. BARING: after deprecating the personal attacks which had been made upon him, begged to be allowed to set himself right with the house respecting that portion of the speech of the right hon. member who had just sat down, in which it was stated that he had called the members of his Majesty's late government "the off-scourings of party and the sweepings of office." Though it could not be expected that he should be very accurate as to the language which he used upon the occasion in question, yet he did recollect that the phrase which had given rise to the misrepresentation of which he complained was speaking of those who lately held the reins of government, and who it was contended could not be succeeded by any other party in the state, simply because they

brought in the Reform Bill ; " How long will this monopoly continue ? is it to last as long as a single successor remains in the public offices of those who were employed in them at the passing of the Reform Bill ? " (*Loud cries of Oh, oh, and laughter from the opposition.*) Having now disposed of one part of the personality affecting himself, he would refer to the way which he had been taunted about pledges ; he never gave any pledge about the malt tax ; he admitted, at the same time, that he should not think of addressing the electors of Essex if he was not prepared to vote for the fullest protection to that interest with which they, above all others, were more immediately connected. — As to what had been said in respect to banners, there was a string of them longer than he had ever observed on any former occasion, and he could not now undertake to speak with respect to their various inscriptions, and in his opinion it would be most unreasonable to fix upon him the responsibility of all of them. With regard to his financial opinions, uttered at different times, they had been made the subject of severe criticism, and he had been represented as sanctioning a general scramble in that house. He begged to be allowed to set that matter upon its right footing. Lord Spencer, when a member of that house, stated early in the year that there was a surplus of 1,200,000*l.* He (Mr. Baring) deprecated the making of any such statement until the Chancellor of the Exchequer should be prepared to enter into the financial details of the current year, for he apprehended that the announcement of such a surplus would excite all the different interests to put in their respective claims for a share, or the whole of it, and thus a general scramble would ensue. He had said that the conduct of the Chancellor of the Exchequer was indiscreet upon that occasion, and he was ready to abide by that assertion. The question now for the house was, could the government dispense with such a sum as the present motion required ? Called upon, as he was, he should say that if there were now a sufficient surplus—if there were a surplus worth dividing—he should be much embarrassed in voting against the motion of the noble lord, for he was aware that there was no interest in the country labouring under severer suffering than the agricultural, at the same time he must say that the anticipated advantage to the farmer from the change had been much overrated. Convinced as he was that there would be no surplus, he felt bound, however reluctantly, to say that the slightest hope could not be entertained of the practicability of remitting such an amount of taxation. In conclusion he said that, whether his votes one year might be set against his votes another year or not, he, at all events, might be permitted to observe, that he was not one who valued office, its powers, or emoluments, as any thing in comparison with a sacrifice of his opinions. He assured the house that nothing could be more humiliating to him than to come down to that house for the purpose of expressing the opinions of others, and that he never would present himself to them as the mere mouth-piece of others.—Mr. P. THOMSON said he was anxious to state the grounds upon which he would give his vote that night, and, more especially, the financial grounds on which he rested that vote. He was extremely sorry to find, from the right hon. baronet's statement, that there would not be a surplus of more than 250,000*l.* The smallness of this surplus, however, he could assure the house was not a consideration necessary to influence his vote. The principles which had been laid down

by the right hon. baronet were in themselves perfectly sufficient. (*Cheers.*) It appeared also that his vote would be given with that of the right hon. gentleman who had last addressed the house ; he could not say that it would be given on the principles put forward by that right hon. gentleman, different as they were from those which he had announced on a former occasion. He (Mr. Poulett Thomson) regarded the tax to be as good as any one which could be imposed ; an evil it must always be, still it was better than any which he could find to substitute in its place. Foreseeing no chance whatever of effecting that substitution for some time to come, or at least until other taxes had been removed, he gave his vote for the tax as a permanent impost, or one enduring until circumstances should be greatly changed. The right hon. gentleman, the President of the Board of Trade, seemed now to feel the force of the arguments used by his right hon. friend the Chancellor of the Exchequer ; but it struck him (Mr. P. Thomson) as strange, that he should not have yielded to them before, for they were the very arguments used last year, the circumstances being, with one single exception, precisely the same in both cases. The right hon. gentleman then proceeded slightly to review the arguments advanced by the right hon. President of the Board of Trade, and contended that there was complete fallacy running through them. The right hon. gentleman then alluded to an observation which had fallen from the noble marquis (Chandos) on the subject of the advantage which would accrue to the farmer from the increased profit consequent upon the repeal. If the profit on a farm were increased, the landlord would take the lion's share. (*No, no.*) Hon. gentlemen might say no ; he contended that the landlord would do so, as indeed he would have a perfect right to do. He was resolved on this occasion to oppose the motion of the noble lord. Although those who sat on his side of the house had been accused of acting from factious motives, he should do his duty in whatever hands the government might be placed. (*Hear.*)—Sir J. GRAHAM said if there were any gentleman within those walls, who by prejudice, by feeling, by inclination, by habit, by common interest, he would add, by common suffering, was identified with the owners and occupiers of land more than any other, or at least equally with any other, it was, he might say, himself. He had the strongest possible feeling for the sufferings of the landed interest—he took a part in the investigation which had been prosecuted in 1833 into the causes of the distress prevailing among them, and he was bound to state, that, so far as his judgment went, no fact was ever more clearly established than that that distress was general, that it had been of long duration, that it was progressive, and that it did require attention. But he was bound also to state, that, entertaining those sentiments, he was still most conscientiously of opinion that the remedy proposed was not applicable to the evils by which agriculture was beset, while it was utterly inconsistent with the welfare of the other interests of the state. The evidence heard before the Agricultural Committee proved the distress of the agricultural interest, and that the pressure principally arose from the low price of wheat. Now, wheat was grown on the heavy lands, whereas the measure proposed by the noble marquis would operate only on barley, which was the produce of the light lands. The hon. seconder of the motion had indeed asserted that the relief would operate indirectly on the heavy lands. But that hon. gentleman overlooked the fact that we had no surplus consumption of wheat,

and that for the last three years we had derived a considerable supply from Ireland. Considering this fact, and that there was yet much unbroken land in Ireland capable of producing wheat, if required, he was at a loss to conceive how the repeal of the malt tax could operate indirectly in relieving the heavy lands of this country. The question was one which was attended with great difficulties. If the repeal of the duty should materially lower the price of beer, then unquestionably the consumer would be benefitted. But if it should not materially lower the price, then the demand would not be increased, and no relief would be afforded to the grower. In that case the revenue would suffer without any benefit accruing either to the consumer or to the farmer. Differing, therefore, altogether from the principles upon the subject of his hon. friend the member for Manchester, he entirely agreed with him in his conclusions; for, beyond all question, a competition for land injurious to the farmer would follow the repeal of the duty. He now came to the question of the absolute necessity of maintaining unimpaired the public faith and credit of this great country. He felt it to be his bounden duty to resist a measure the tendency of which must inevitably be to shake the public credit. He believed that the hon. member for Middlesex was prepared to meet the defalcation by a reduction of the estimates. Now it was well known, and it was a fact highly creditable to the government which preceded that of Earl Grey, as well as to that noble earl's government, that by great and continued efforts those governments had reduced the public expenditure to a degree which, in 1823, the hon. member for Middlesex himself did not believe practicable. It was true that the house had heard from the hon. member for Derbyshire of the advantage that would be derived from a Grote and Warburton administration. He meant no disrespect to either of those hon. gentlemen, but knowing the men with whom those gentlemen would be associated in the government, he should certainly regard with apprehension their accession to office. It was impossible but that the hon. member for Middlesex must form a part of such a government. It was impossible also but that the hon. member for Southwark, who had stated to his constituents, that having measured himself against other individuals in public life, he felt in no respect inferior to any of them, must, with such a consciousness of the extent of his power and ability, hold a high office in such a government. Now, to an administration so constituted, he (Sir James Graham) had a decided objection. Did the landed interest conceive that the repeal of the malt tax would adequately compensate them, not only for the imposition of a property tax (a graduated property tax according to the hon. member for Southwark), but for the repeal of the corn laws? What now were the burdens upon the land? First, the poor; but measures had already been taken to get rid of that burden. (*Hear, hear.*) Then the tithes, and he hoped that on proper terms that burden might be diminished. (*Hear, hear.*) A lessening of the burden of the county rates had likewise been distinctly promised to the landed interest. The only burden that would remain, therefore, would be the malt tax. Now, if all the burdens on agriculture were to be removed, all the means of resistance to the repeal of the protection which agriculture derived from the corn laws would disappear. For all these reasons, therefore, he could not hesitate in giving his vote against the proposition of the noble marquis. It was true

a proposition might be made by an hon. gentleman on the other side of the house which might perhaps shake his determination. The hon. member for Cricklade, in a speech which he made to his constituents, had said that so great was his aversion to the duty under consideration, and so strongly and frequently had he expressed that feeling, that he was familiarly known among his colleagues in the late government by a monosyllabic nickname. (*A laugh.*) That nickname was "Malt." The hon. gentleman had declared that he was for the immediate repeal of the duty, and that he had prepared a measure for that purpose, of the success of which he was exceedingly sanguine, when his efforts and his hopes were all at once cut short by the dismissal of the Melbourne cabinet. Now he (Sir J. Graham) was so confident in the hon. gentleman's ability and industry, that if he were to declare that he had actually matured such a measure as that alluded to, it might perhaps shake his (Sir J. Graham's) intention to vote against the noble marquis's motion; otherwise he must certainly oppose that motion.—Mr. R. GORDON observed that the hon. baronet who had just sat down had talked of the inexpediency of crimination and recrimination; and yet his whole speech had consisted of little else but attacks upon one hon. member or another. (*Hear, hear.*) With respect to the hon. baronet's attack upon himself, he had little expected it from such a quarter. But if the house would permit him, he would state what he had said to his constituents. He told them that he had uniformly supported the repeal of the duty on malt, and that he had on every occasion urged the repeal on the government of which he had been a subordinate member, until they were sick of the subject; but that he regretted to say that no intention had been expressed by that government to propose the repeal.—Mr. HUME expressed surprise at the manner in which the hon. baronet, in the latter part of his speech, had endeavoured to terrify the house by attacking the characters of hon. gentlemen in a manner little honourable to himself, and especially by intimating that the public faith and credit would be endangered by an administration of which the hon. members for London, Southwark, and Bridport, should form a part. The hon. baronet had wondered whether any honourable member was prepared to show the means of meeting the deficiency in the revenue which the repeal of the malt duty would occasion. He (Mr. Hume) was prepared to do so; and he had done it on former occasions. The vote which he should give was the same as that which he had formerly given; for he should vote for the repeal of the duty. It was the duty of that house to examine every charge to which the community at large was subject, and whenever it was practicable to remove that charge. The whole community would be benefited by the repeal of the duty; and it was on that that he advocated the repeal. Not only did he not think that the repeal of the tax on malt would not shake public credit, but he conceived that the continuance of the duty was injurious to public credit, by the mischievous effects which it produced on a large part of the population of the country. It was manifest that, as the price of beer had risen, the consumption of ardent spirits had increased. In his opinion, therefore, the house was in duty bound, by the repeal of this tax, at once to relieve the community from a heavy burden, and to improve the morality of the country, which had been so deeply injured by the disgraceful reduction in 1823 of the duty on spirits.

He now came to the financial consideration of the question—namely, how a deficiency in the revenue of 4,600,000*l.* could be supplied? The house were, perhaps, not aware, that the large establishment of Excise officers which were formerly necessary to collect the tax on beer had been kept up to the present moment, for the purpose of collecting the malt tax. The whole expense of the Excise exceeded 1,200,000*l.* Now he (Mr. Hume) was satisfied that if the malt duty were repealed, 500,000*l.* of that expense might be saved. That would leave only 4,100,000*l.* to be provided for. Now it had been stated by the late Chancellor of the Exchequer, on the 14th of July, that although six millions of taxes had been taken off since the year 1831, the actual loss to the revenue had been only half the amount. The reason was, that the people who had been relieved from those taxes had laid out their money in other articles subject to taxation. Taking, therefore, the sum in question at 4,600,000*l.*, he was convinced that the only actual loss which they had a right to calculate upon would be two millions and a quarter. This left only 2,100,000*l.* to be provided for, no difficult matter when they took into account the increase of revenue that would accrue from other quarters, in consequence of the reduction on this article. Such, during the last half century, had been the uniform result of any reduction of taxes that had taken place. The right hon. baronet the Chancellor of the Exchequer, had said, in his usual magniloquent style, that the sum sought to be repealed was one-third of the whole disposable taxation of the country; but was this really the case? The late Chancellor of the Exchequer told them in his budget of July last, that 14,500,000*l.* was the amount of charge for the army, navy, ordnance, and half-pay. There was further, a sum of 1,963,000*l.*, which went to the civil list, diplomatic expenses, sinecures, and pensions. Why should they keep up such an enormous diplomatic expenditure for the purpose of making Lord Londonderry Ambassador? (*Cheers.*) There were besides, other charges, amounting to upwards of 3,500,000*l.*, which raised the total of disposable expenditure to 20,000,842*l.* The whole of this might be dealt with except the Civil List and a portion of the salaries of the Judges.—Sir JAMES GRAHAM—And the half-pay.—Mr. HUME would admit that the half-pay should not be touched, but having made these exceptions, was any man prepared to say that 3,000,000*l.* might not be saved out of the rest, and very little more than two millions was wanted. If the right hon. baronet the Chancellor of the Exchequer would only concede the settlement of the Church question in Ireland, a million of this might at once be saved from the military expenses of that country. (*hear, hear.*) Or if he would do justice to the Colonies in America and elsewhere other large sums might be saved in the same department. In Canada alone 3,000 men costing 300,000*l.* might be saved. Or if the militia were reduced 350,000*l.* now wasted, might be saved. Or take the volunteers, which cost 180,000*l.* annually, in order that a number of gentlemen might be well mounted without being subject to the horse duty. But suppose that ten per cent. only was taken from the 20,000,000*l.* see what an immense sum it would amount to; and there could be no difficulty in doing it if Ministers were really anxious to relieve the people from a part of the burdens which pressed upon them. Before the right hon. baronet the member for Cumberland came into office he had repeatedly pressed upon Government the possibility of reducing the naval expenditure of the

country by a million and a half, without impairing the efficiency of the service. Had the result proved him to be wrong? No; for the right hon. baronet had reduced the expense of that department 1,300,000*l.*, and had left the service more efficient than he found it. In the Ordnance department much might yet be done. All who desired to force economy upon Ministers would vote for this motion; and that it was necessary to force economy upon the Government was proved by the fact that neither in the speech from the Throne, nor in any other speech that he had heard, had any hope been held out of a reduction of taxation. (*Hear.*) He had shown that this tax might be reduced without the substitution of another; but if it were necessary to find another, there was no difficulty in doing so. There had been taxes proposed, and acts passed, by those who consulted their own interests. The nobles and those who held large property made a law which suited their own views. One act of this kind would illustrate what he meant. One act was passed, by which any person to whom a bequest was made of one hundred pounds, must pay, if he were not related by blood, ten pounds to the public revenue out of that legacy. But how was the case with the property left by the rich? He would state one case in illustration. The Duke of Sutherland died lately, and left to his family a property of 240,000*l.* a-year, and on this not one farthing duty was paid to the public. He would say if they wanted an additional tax, let them tax such properties as that which he had mentioned, and they would find ample means to make good any real loss to the revenue occasioned by the reduction of the malt tax. Now he would ask the right hon. baronet opposite (Sir Robert Peel) whether he thought he could have any difficulty in making this reduction out of the expenditure, when he (Mr. Hume) had given to the right hon. baronet four items amounting to nearly one million. In addition to this he proposed a reduction of ten per cent. upon the collection of the revenues, which, coupled with the other savings he had pointed out, would leave such ample funds that every man might with a safe conscience vote for the abolition of this tax; and he pledged himself that the public credit would stand higher in proportion as the ability of the people to pay their taxes was increased. (*hear, hear.*) He appealed to those hon. members who usually thought with him, but who, on this occasion, seemed to entertain the erroneous notion that, in their endeavours to repeal other taxes, the right hon. baronet at the head of the Government would go with them—he entreated his friends to repel this notion, and to join with him in the sentiment that the malt tax was a bad tax, and ought to be repealed, inasmuch as it fell upon that portion of the industry of the country which was least able to bear it. (*Cheers, "and loud cries of question, divide, in the midst of which"*)—Mr. PEASE rose and said he could not consent to give away between 4,000,000*l.* and 5,000,000*l.* of taxation at the sacrifice of leaving the public creditor unprovided for. (*hear, hear.*) No just grounds had yet been shown for such a course, and his vote should be a decided negative to the motion now before the house for the repeal of so important a portion of the taxation of the country.—Mr. GROTE said that he considered the arguments of the right hon. baronet opposite (Sir R. Peel) to be unanswerable, and he rejoiced that the right hon. gentleman had this evening dealt with and dispersed so many of the agricultural fallacies so often put forth in this house. (*Hear, hear, "and loud cries of question, question, and divide."*)

Sir R. GRESLEY rose amidst continued and general cries of question and divide. He felt it incumbent upon him to give his vote against the motion of the noble marquis near him, because he held it to be the bounden duty of every true patriot—(*laughter*)—under the circumstances in which the country was at present placed, to consider not the mere question of the repeal of the malt tax, but the inevitable result which must follow the success of that motion—namely, the dissolution of the present government. (*Cheers and laughter.*) It was on these grounds that he held it to be his present duty to alter the vote which he had intended to give, and to vote against the motion of his noble friend. He contended that the suddenness and variety of the changes which had taken place in the political circumstances of the country—circumstances which baffled the keenest foresight—justified a man in voting to-day in a sense contrary to that in which he would vote to-morrow. (*Loud laughter*) He knew very well that in giving this vote he should to a considerable degree and extent offend those who had returned him, on the present occasion, but he should be ashamed of himself if for any personal object he should violate his strict conscientious feelings. (*Renewed laughter.*) He should be ashamed of himself if, with a view to his own individual and personal interests, he should, by his vote, produce such a result as must inevitably ensue if the motion was carried—namely, the turning out of the present government, and installing in their places a democratical administration, the object of whose dominion would be the establishment of annual Parliaments—(*hear, from the opposition,*)—of universal suffrage, vote by ballot, the secularization of church property, the separation of the church from the state, the confiscation of private property, the destruction of the hereditary peerage, national bankruptcy, and civil war. (*Loud laughter.*)—Mr. HODGES, amidst great confusion, claimed the indulgence of the house for a few minutes, as he was not disposed to acquiesce in an adjournment of the debate. (*Cries of "oh, oh! divide, divide."*) He begged, in the first place, to offer his sincere thanks to the noble marquis opposite (Chandos) for the manly conduct which he had exhibited to the house and to the country with reference to this question. It was some consolation to find that there was a man of the noble Marquis's rank prepared to stand by his pledges—(*cheers*)—and whose conduct was calculated to recover that character for the house which was endangered by the course pursued by other members. (*Loud cheers from the opposition.*) The abolition of the malt tax would, in his judgment, lay the foundation for the restoration of that understanding, sympathy, and regard which formerly prevailed between the working and all other classes in this country. He admitted to the fullest extent the ability with which the right honourable Baronet at the head of the government had met the question, but he (Mr. Hodges) was satisfied the defalcation in the revenue consequent upon the abolition of this tax would be provided for in the bill of the noble Marquis opposite, and that by a saving in the expenditure, and, whether or not, it might be necessary to impose fresh taxes, they would, he believed, be very small in amount. In a word, if justice was done to Ireland by the present government the whole matter would in a great measure be accomplished.—Mr. HALL DARE entirely concurred with the honourable member who had just sat down in thinking that the worst feature of the present times was the alienation of the lower

classes from those who were similarly circumstanced with the class which he now addressed, but he dissented from the honourable member in the reasons which he had assigned. He (Mr. Hall Dare) believed that this estrangement or alienation was to be attributed to the writings promulgated and the speeches delivered under factious, personal, and ambitious motives, by gentlemen both in and out of the house. (*"Oh, oh!" and cheers.*) If the motion of the noble marquis was successful, and power were to pass, in consequence of its success, from his right hon. friend's hands into those which had been designated on a former evening by the hon. member for Derbyshire, the confidence of the people in the permanent security of our institutions would be shaken, and the reins of government would be intrusted to those who, by their speeches and their measures, had always shown themselves the enemies of the agricultural interest. (*Hear, hear.*) He believed that the success of this motion would, in its ultimate effects, produce the repeal of the corn laws. (*Cheers.*)—Mr. CURTEIS had only one observation to make. If the hon. member for Derbyshire could, to keep ministers in, violate such pledges as he had solemnly recorded in print, he would confess that he, who was not friendly to those ministers, would not violate one thousandth part of such pledges to turn them out. (*Cheers.*) He most cordially supported the resolution of the noble marquis.—Mr. TREVOR, amid incessant cries of "Question" and "Divide," stated that his reason for voting against the motion of the noble marquis was that he considered it unseasonable.—The Marquis of CHANDOS, in reply, expressed his regret that any hon. member should deem his resolution unseasonable. He expressed his surprise at the change of opinion which he had that night witnessed in the house. (*Hear, hear.*) He had a deep feeling of alarm lest all confidence in public men should be lost by it. (*Cheers from the opposition.*) If hon. gentlemen could make promises and professions on the hustings to their constituents, and then, when they appeared in Parliament, could change their sentiments and votes, the constituency could no longer place that confidence in them which ought to be placed in them, and on which he believed the security of the country depended. (*Cheers.*)—The house divided, when there appeared—

|                                   |     |
|-----------------------------------|-----|
| For the resolution .....          | 192 |
| Against it .....                  | 350 |
| <hr/>                             |     |
| Majority against the resolution.. | 158 |

The announcement of this majority was received with loud cheers.

MAY, 1835.

No. 5.]

[VOL. II.

## THE PLATE.

The subject of the plate is a Durham Cow bred by FREDERICK OTWAY, ESQ., of EDDLETHORPE, near YORK, and fed by JAMES RHODES, ESQ., of ISLINGTON. She was got by VAUNTER (1543) dam by BLUCHER, (84) grandam by WINDSOR (698). VAUNTER was by PIONEER, who was also the sire of the celebrated CASTLE HOWARD OX. This beautiful animal was exhibited for the prize in Class 6. at the last Smithfield Show, and would unquestionably have obtained the prize had the breeder's certificate arrived in time. She was afterwards sold by Mr. Rhodes to Mr. Humphries, Butcher, Maida Hill, Paddington, and on being killed, the carcase weighed 159 stone, 2 lbs.; the loose fat, 23 stone; 8 lbs. to the stone.

## EMIGRATION CONSIDERED RELATIVE TO POOR LAWS FOR IRELAND.

TO THE EDITOR OF THE 'FARMER'S MAGAZINE.'

Sir,—The attention of the neighbourhood in which I reside is at the present moment engaged with the subject of emigration. In almost every parish some of the labourers and their families are preparing to embark either for Canada or the United States of America, with the cheerful prospect before them of plenty of employ at good wages; and undoubtedly this prospect will be realized provided they carry with them industrious habits and a sufficient degree of self-denial to resist the temptation the cheapness of spirituous liquors give rise to, both in the United States and in Canada. It is impossible that any accounts can be more favourable than those received from the labourers themselves, who have emigrated within the last few years. I have read several pamphlets of these letters, published by different emigration societies in various parts of the kingdom, and they all agree exactly in the nature and extent of the benefit they derive in consequence of the spirit of enterprise which prompted them to take their labour from a market which is over supplied to one where it is in great demand.

I would particularly call the attention of your readers to a collection of letters published by the Petworth Emigration Committee, and another collection received from the labourers who emigrated from the neighbourhood of Bath.

It is not, however, my wish now to attempt to shew the great benefit derived by the able-bodied and industrious labourers by emigrating from the

eastern to the western hemisphere; because this fact is now generally admitted, in spite of the endeavours of levellers and jacobins to persuade the peasantry of England to distrust alike the system of emigration, and those who advised them to adopt it as a means to obtain "full employ at good wages." These gentry well know that their power and influence is derived solely from the discontent of the necessitous part of the community, and consequently they raise their unprincipled clamour against any object which would have the effect of reducing the number of the distressed.

My present intention is to consider this subject relative to Ireland only, with a view to shew that the expense of emigration incurred by the landowners and occupiers of England is only just so much money put into the pockets of the Irish landlords, and that nothing but Poor Laws for Ireland can effectually remedy this injustice.

On the 21st of this month a vessel is to arrive at Portsmouth, for the purpose of taking in emigrants from several parishes in Sussex, to convey them to Canada. Here is a heavy expense incurred both by the owners and occupiers of the land in the parishes which these people belong to; perhaps each individual who emigrates will cost the sum of ten pounds. In some cases this charge rests entirely on the tenant; in others the landowners pay a proportion of a half or a third; but, however the expense may be met, it is in every instance a very serious charge, and one which, under the present depressed price of agricultural produce, can be but indifferently afforded. Now, at the same season, and may be on the very same day, that these people are sailing from Portsmouth, for the obvious purpose, be it remembered, of reducing the supply of labour in this country, several packets sail from the different Irish ports, bound for England, full of half-starved Irish paupers, who are in the course of a few days to become applicants for work, and, in fact, whose very existence must depend on this self same labour-market, glutted as it already is, and this supply of labour beyond the demand, is fully exemplified by the sailing of the ship from Portsmouth I have before described. I have heard of the digging of holes on one day, and filling them up on the next, applied as illustrative of many negative sort of proceedings; for our purpose now I think it is admirably suited, and if the reader should wish to reduce the above maxim to a more practical shape, he has only to imagine an English squire—and it is easy to find such a one—who let his estate seven years ago, on lease of fourteen years to a respectable tenantry. At the time these leases were granted, we will suppose the squire to have found his estate encumbered with a poor-rate of five hundred pounds a year, which sum he was at that time of course obliged to deduct from the rental value of the land; thus, if there had been no poor-rate to pay, his income would have been two

thousand pounds per annum, but on account of such poor-rate, he had consented to fix it at fifteen hundred pound per annum, during the fourteen years. Well, as we suppose seven years of the term of these leases to be expired, seven years of the term are now remaining, but how stands the poor-rate? Why it has increased a third, and now the tenants instead of having to raise five hundred pounds among them for this purpose, as was the case when they entered into their several engagements, they find they have now seven hundred and fifty pounds to pay. Pray let the reader imagine to himself this squire and his tenants in these circumstances (the former with justice complaining that since he purchased the property twenty years ago, his income had been reduced twenty per cent. by the increase of the poor-rate; and the latter, with equal justice, declaiming because in the middle of their term, they find this charge had increased one third;) being satisfied that something must be done in this emergency—uniting their efforts, both of pocket and of body, to reclaim a certain swamp on the estate, for the common benefit of the whole. In order to accomplish this object, the water is drained off into a neighbouring mill-stream, much to the improvement of the property of Dustypole. Imagine this object accomplished, see the complacent countenance of the squire and his tenants at the prospect of fine alluvial production, which they hope will in due time compensate them in some degree for the great trouble and outlay of capital this improvement has required. Imagine them thus, and then picture to yourself their horror, or, perhaps, the term which Sterne adopts to express the mental agony of his hero, Dr. Slop, would be the more appropriate on this occasion—"their hydrophobia"—on the discovery that some absentee Irish landlord, who happened to possess an adjoining swamp—just such a one as our squire and his tenants had reclaimed—was preparing, in order to reduce his to the same state of usefulness, coolly to inundate his neighbour's improvement. Pray do not do this act of injustice, would be the remonstrance—your present proceedings will be our ruin—on the other had, there is the stream of neighbour Dustypole which would be improved by your directing the drainage of your water to it. It is true it will cost you more capital to do this; but do be just and remember the great expense we have incurred to attain this object. What is the reply of the Irishman? I shall do no such thing; the law authorises me to disencumber myself at the sacrifice of your interests, and in a few hours your improvements will be again under water. The only remedy which now remains for the squire and his tenantry, is to petition the Legislature to *compel* the Irishman either to confine his flood within his own boundary, or if he be determined to proceed with his improvement, that he be allowed to do so only by availing himself of the harmless facility afforded by Dustypole's mill-stream. With claims so reasonable and just, we may, I think, fairly imagine the return of the hydrophobia fit on the constitutions of the landlord and his tenants, when told the legislature had on some *crotchet of policy*, refused to protect them.

Now does not the above illustrate fairly the real state of this question. Can or ought this destructive system to continue, and is it not in *truth* if not in *name*, a plan of poor-laws for Ireland by which the *English land is taxed for the payment of Irish poor-rates*.

It may be said that the Irish poor come over only for the summer months, when labour is in

great demand, and that they return again late in the autumn to Ireland, to winter on their stock of potatoes. When this is really done, the injustice of this temporary importation of labour is not, I admit, so heavily felt by the payers of the English poor-rate, as when the Irish paupers come over for the purpose of permanently remaining in England, and this is done to a considerable and ruinous extent for it is a well ascertained fact that in and about London, and the large provincial towns of England, the tradesmen's labourers include a vast number of Irishmen. Let these be withdrawn, and as they have a right to be provided for in their native part of the kingdom, and then their places and labour would be supplied by the surplus men from our own agricultural districts.

There is a sympathetic feeling which occasions the Irish pauper to follow the Irish peer to England; this at first sight may not be perceptible, but I think on reflection it will be acknowledged to operate in the following manner. The Irish peer comes to reside in England, and every farthing of rent that his agent can *screw* from his tenants, is sent here for his use. The production of the soil, (I mean the beef, pork, bread, and butter,) naturally follows the rent as the means of purchase, leaving the potatoes and buttermilk as the wages of labour; and those who are not satisfied to exchange their labour for potatoes and buttermilk scantily supplied, and it is not extraordinary that multitudes are dissatisfied with this exchange, "take up their tatters" and follow the beef, pork, bread, and butter to England with the hope of being able to earn wages high enough to put some of these necessities within their reach. Some persons are opposed to poor-laws for Ireland because they are disgusted by the dangers which have during a long succession of years crept into the English poor laws, and consequently would avoid if possible, subjecting Ireland to the chance of perverting a principle excellent in itself, but decidedly very liable to be abused in the administration of several of its provisions. But this appears to me to be an argument in favour of the present being the time for the sister kingdom to make the attempt with the experience of the operation of the English poor-laws before us for more than two hundred years Ireland might select what was desirable, and avoid the dangers and corruptions which we unfortunately during the time, and particularly during the last thirty years, have fallen into, and after all I have heard advanced of the difficulties to be apprehended in an attempt to institute poor-laws for Ireland, I am far from being convinced but that the supporters of the English poor-law amendment bill had to encounter quite as intricate a subject, and probably more opposition in their progress than would beset any ministers who should determine to become the framers of poor-laws for Ireland, because in the former case the very nature of the abuse to be remedied, was of an invidious character inasmuch as it advanced justice, circumspection and economy, in lieu of lavish expenditure and mistaken philanthropy. Whereas, the latter, even if it proceeded with all the caution and respect for property that human ingenuity could call to aid, would still be felt and acknowledged to be a merciful relaxation of an "iron hand" offered by a humane legislature for the relief of a suffering multitude.

I am, Sir, your obedient and very humble  
servant,

AGRICULTOR.

Sussex, April 14, 1835.

## BRISTOL AGRICULTURAL SOCIETY.

The second anniversary of this Society was held on the 28th February, at the New Cattle Market, Temple Gate. The exhibition of Live Stock was not so large as was anticipated, but there were some fine specimens of the various classes, and on the whole the show was highly creditable to the farmers and breeders of the surrounding neighbourhood.

The meeting for business commenced at eleven o'clock, J. S. Harford, Esq., in the chair. The report of the committee was then read, after which Mr. Woodward, of Bredon's Norton, near Tewkesbury, was appointed censor of the Live Stock; Mr. Webb, of Castle-street, Mr. Smith, of Ashton, and Mr. Rich, were appointed to adjudge the premium offered by Mr. Beard, for a composition to keep the fly from striking sheep; and Messrs. Taylor, Peters, and Fyson, to examine the claims for good behaviour.

A report was read from the committee appointed to examine the claims for the premium of 10*l* to the individual who had judiciously expended the most money in agricultural labour. They declared their award to be in favour of "Live and let live." Their report having been adopted, the chairman proceeded to open a letter containing the real name of the competitor,—Mr. George Webb Hall, whom he thereupon complimented, not less for his liberality and judgment in the management of his estate, than for his success on the present occasion.

Mr. Hall could not but feel particularly gratified, inasmuch as the gentlemen who had awarded the premium, had stated that they had not hastily subscribed their names to their report, but that, having examined the accounts produced as vouchers for his claim, the statements contained in his communication were fully borne out by facts.

The Secretary then read a communication from Mr. Joliffe, entitled, "A secret worth knowing: how to feed swine with profit in these cheap times." It detailed the writer's management of these useful animals, and the success that had resulted from his system. The document was listened to with a great deal of interest, and Mr. J. received the thanks of the meeting.

Mr. Highman, of Bath, then exhibited and explained the nature of an apparatus for drenching animals; and also his new invented bits. The former was highly approved of by Mr. Rawlins, Veterinary surgeon, of Wells, and also by Mr. Leigh, of the Bristol Horse Bazaar; and, with respect to his bit, George Worrall, Esq. and Dr. Bompas, said they considered it a good and useful invention: they were persuaded it would prove a great relief to the horse, have a good effect upon his temper, and at the same time make his mouth more lively. Mr. Highman received the thanks of the meeting, with permission to publish the same, if he thought it desirable.

Dr. Bompas announced that the chairman had kindly offered a premium of 5*l* for the best method of draining land; and Mr. Mullins stated that, having called on Mr. John Hare, jun., on his way to the meeting, that gentleman had kindly signified his intention of contributing an annual premium of 5*l*, leaving it to him (Mr. M.) to fix the object; he would propose that it be added to the other premiums for the promotion of industry and good behaviour. The meeting acquiesced in this proposition, and passed a vote of thanks to J. S. Harford and J. Hare, jun., Esqs., for their liberality.

Five models of machines were then exhibited by

Mr. Cadogan Williams, for grubbing, breaking stones, threshing, raising water, and for hacking land. Mr. W. received the thanks of the meeting.

The awarders of Mr. Beard's premium made their report, and adjudged it to Mr. C. C. Hardwick, for his composition, composed of the following ingredients:—1 lb. sulphur; 1 lb. white lead; 1 lb. hellebore, in powder: and half-an-ounce of oil of wormwood. The above, properly mixed, will be sufficient to dress 75 sheep or 100 lambs.

Mr. Hardwick detailed the success he had experienced from the use of his composition among his own flock, and gave several instances of its usefulness to those neighbours to whom he had recommended it.

The report of the judges of live stock was then read, and a vote of thanks was passed to Mr. Woodward for his kind assistance.—Mr. W. returned thanks.

The report of the gentlemen appointed to examine the claims to premiums, under the head of industry and good behaviour, was submitted to the meeting and received its sanction.

Mr. Hall then rose to address the meeting on the subject of poor laws for Ireland, which he considered to be a question of great national importance. Any gentleman who took an interest in what was passing between the two countries, and who observed, not only the immense influx of Irish produce, but also of Irish people, who come here, must, when he reflected on the fact that the poor in that country were denied that provision which subsisted for the poor in England, be convinced that great injustice was done to the occupiers of land on this side the Channel. He did not deny the fair title of Ireland to that market for her commodities which the act of union had secured to her; all he was anxious for was, that that union should be consistent in all its parts,—that, while the intercourse between the two countries, by means of steam-packets, had connected them as if by a bridge, the wants of her own population should be met before she sent a vast amount of produce into this country, to the injury of our own growers. He took his stand on unquestionable ground when he said that the labourer was worthy of his hire, and that the peasantry of Ireland had a claim to be somewhat better fed than the four-legged animal which was commonly the inmate of his family. But it was a subject of great importance, as deeply connected with the national economy. It was well known that Ireland was the scene of lawless aggression, and that instances, too numerous, of cold-blooded murder, and a variety of other appalling facts might be adduced to show that the state of society there was perfectly unnatural; and to what was it to be traced if not to a want of that inestimable blessing—labour? When, by the act of union, our markets were thrown open to the sister country, and the duties on importation were repealed,—a spirit of competition having found its way there, I do think that, in common fairness, the poor laws of England should have been extended also to Ireland. Those laws were, to a great extent, founded on good principles: in particular, he admired that portion of them which, while it ensured to the pauper a remuneration not far below the minimum of wages, ensured also his being kept to labour. For the want of this wholesome provision the poor of Ireland had become demoralised, and this demoralization had gone on in a geometrical ratio with their poverty. Living like pigs, they were susceptible only of mere animal feeling; and the evil had gone on until at length the state of the popu-

lation was so degraded, and, as a consequence, society was so insecure, that were he offered a thousand pounds a-year, on condition of living among them, he would not accept of the offer. He held the security of property to be one of the greatest blessings in a civilized country, and if a man were not taught that he had an interest in its preservation, what was there to prevent him from taking by force whatever he could lay his hands upon? He was no advocate for making men paupers: on the contrary, he believed that incendiarianism, in our own country, was mainly owing to a want of employment, and that it might be traced to an unwise departure from that sound principle which aimed at elevating the labourer by awarding him a just remuneration for his services, instead of degrading him by eking out his wages from the parish rates. Such a practice he held to be detestable and illogical, and so certain was he of its baneful results, that he would take the map of England and wherever he found it to prevail, there would he be sure to find incendiarianism. In the same way he would take the map of Ireland, and wherever he found that the population, when employed, were receiving but 5d. a-day on which to support a family, there would he be sure to find outrages such as were wholly irreconcilable with the well-being of society. He considered the subject peculiarly applicable to an agricultural meeting, such as the one then assembled; for, in consequence of there not being that fair provision for the population of Ireland, which justice to all parties demanded, that food which ought to be appropriated to their sustenance was transferred to this country, and brought into direct competition with its own productions. He would, then, appeal to every farmer—he would appeal to those who were in the habit of witnessing the fine market in which they were then assembled crowded by animals that were not wanted, because of the thousands that were constantly being landed from the sister country,—he would call upon them to join him in the present measure. When they saw, also, that an extensive military force was kept up in consequence of the disordered state to which Ireland was reduced, in great measure, he would maintain, for the want of the remedy he alluded to, he felt it to be the duty of every man to raise his voice to the legislature to procure that redress which the case demanded. But there was one other consideration which he might enforce with peculiar propriety, and that was the manner in which the question affected this city in particular. From the local situation of Bristol, and from the intercourse constantly going on between it and the sister isle, its inhabitants were taxed to a large amount annually to send back the Irish peasantry who periodically flock to this country in the hope of bettering their condition. He would appeal, then, to the inhabitants of Bristol, and ask, whether it was not just and reasonable that those poor people should have a legal claim upon their own soil? Upon these grounds he begged to be permitted to offer the resolutions which he held in his hand. He would only add, that a meeting like the one he had the honour to address, consisting, for the most part, of practical men, were just as capable of forming an opinion, and coming to a right resolution upon the subject, as, probably, the legislature itself; and should the resolutions be adopted, he meant to follow them up by a brief petition embodying their principal points.

The resolutions having been moved by Mr. Ward, and seconded by Colonel Maclean,

Mr. Fyson asked whether, in speaking of the

poor laws, Mr. Hall alluded to the old or the new system?

Mr. Hall said he alluded to the provisions of the 43rd of Elizabeth, which provided subsistence for the maimed and indigent.

Mr. Fyson was not exactly satisfied with this explanation. He expected Mr. H. to have stated explicitly whether he was in favour of the old or the new system, because there was a wide difference between the two.

Mr. Tuckett thought, before the society proceeded to recommend poor laws for Ireland, it ought to agree as to what system was best adapted for our own country. He could not agree with Mr. Hall in assigning the present condition of Ireland to the absence of poor laws, and still less would he assent to the assumption that demoralization was consequent on a low rate of wages. If such were the fact, what must be thought of the inhabitants of Hindostan, whose wages were only equal to about three-half-pence per day English currency? He thought Mr. Hall's arguments did not fairly apply to the case. He thought that it was a question rather of national policy, and, as such, that it could not be fairly discussed without going beyond the limits which the society had marked out for itself.

C. L. Walker, Esq. said there were one or two local points, upon which Mr. Hall had touched, on which he totally differed from him. The great immigration of the Irish poor was at Liverpool, and not at Bristol; and then, with respect to the influx of Irish produce, being himself a considerable proprietor in the steam-packets, he could speak positively that Bristol had greatly benefited from it. The dock company, in particular, derived a benefit from that portion of the trade of the port amounting to between one and two thousand pounds per annum.

The Chairman observed, as it was above all things desirable, in the present infant state of the society, to preserve unanimity, perhaps Mr. Hall would consent to his resolution being withdrawn.

Mr. Hall had no other object than a desire to elicit truth. He claimed the privilege of forming an opinion for himself, and he should be a most unreasonable man if he denied the same liberty to others. He had brought forward the same subject at Bath, and it was there decided that it would be quite ridiculous not to entertain a question of domestic policy. True, there was no petition adopted on that occasion, but it was determined that a premium should be offered for the best essay on the subject. With respect to the rate of labour in Hindostan, the inhabitants, who subsisted chiefly upon rice, were of a much simpler nature and totally different from those of the inhabitants of Europe. "They would find too, that although closely connected, the inhabitants of England and Ireland were totally dissimilar, the latter country being almost perpetually in a state of rebellion. He had no wish to restrict the importation of what might be fairly regarded as surplus produce, but it was time to devise means for a sufficient portion being kept back to feed its own population. He was happy at all times to defer to the opinions of others, when he could do so without sacrificing principle; but he must be excused on the present occasion if he pressed the resolutions.

The Chairman observed that, in common with others, he held an opinion upon the subject of the resolutions, but he must confess he should find a difficulty in going into the question, trenching so closely as it did upon politics, without infringing

the rules of the society. As a matter of prudence, then, seeing that, if the question was passed, it might be attended with some difficulty, and operate prejudicially on the society as regarded the support of the commercial interest of Bristol; he would again appeal to Mr. Hall, whether it had not better be withdrawn.

Mr. Hall consented that the resolutions should be withdrawn.

The business here terminated with a vote of thanks to the chairman, which was carried by acclamation.

### PREMIUMS AND BOUNTIES.

#### LIVE STOCK.

|                                                                                                                                  |      |
|----------------------------------------------------------------------------------------------------------------------------------|------|
| For the best bull, cow, and offspring, improved short horned breed, Mr. Charles C. Hardwick, a premium of . . . . .              | £ 15 |
| For the best fat cow, improved short horned breed, ditto, a premium of . . . . .                                                 | 5    |
| For the best four fat wethers, Somersetshire breed, ditto, a premium of . . . . .                                                | 3    |
| For four three-year-old steers, Hereford breed, Mr. T. Smith, bounty of . . . . .                                                | 2    |
| For the best fat ox, Hereford breed, ditto, a premium of . . . . .                                                               | 5    |
| For four oxen, Hereford breed, ditto, a bounty of . . . . .                                                                      | 2    |
| For the best fat ox, having worked, Devon breed, Mr. Thos. Hardwick, a premium of . . . . .                                      | 5    |
| For the best four fat ewes, improved Leicester breed, Mr. George Limbrick, a premium of . . . . .                                | 2    |
| For the best long-wool ram, improved Leicester breed, ditto, premium of . . . . .                                                | 3    |
| For a fat wether sheep, improved Leicester breed, ditto, a bounty of . . . . .                                                   | 1    |
| For bull, cow, and offspring, Ayrshire breed, J. Haythorne, Esq., a bounty of . . . . .                                          | 2    |
| For the best fat pig, ditto, a premium of . . . . .                                                                              | 2    |
| For the best yearling cart colt, ditto, a premium of . . . . .                                                                   | 3    |
| For the best boar and sow, Mr. William Bennett, a premium of . . . . .                                                           | 2    |
| For the best yoke of grazing oxen, having worked, Sir John Smyth, bart., a premium of . . . . .                                  | 4    |
| For the second best yoke of grazing oxen, having worked, Hereford breed, George Worrall, Esq. a premium of . . . . .             | 3    |
| (Given by W. Miles, Esq., M.P.) For the best five-long-wool ewes, improved Cotswold breed, Mr. Geo. Rich, a premium of . . . . . | 5    |
| For the best cart stallion, to Mr. Thomas Deacle, a premium of . . . . .                                                         | 5    |
| For two three-year-old steers, Hereford breed, Mr. R. Jolliffe, bounty of . . . . .                                              | 2    |
| For a Hereford bull and cow, Mr. William Hewlett, a bounty of . . . . .                                                          | 3    |
| For two Hereford and Devon heifers, Mr. James Long, a bounty of . . . . .                                                        | 2    |

#### AGRICULTURAL LABOUR.

|                                                                                         |    |
|-----------------------------------------------------------------------------------------|----|
| For most money judiciously expended in agricultural labour, to G. W. Hall, Esq. . . . . | 10 |
|-----------------------------------------------------------------------------------------|----|

#### INDUSTRY AND GOOD BEHAVIOUR.

|                                                                                                                   |   |
|-------------------------------------------------------------------------------------------------------------------|---|
| Richard Highwood, for 36 years' servitude with Mr. T. Hardwick, of Worle, the premium of . . . . .                | 4 |
| Edward Hellier, for 26 years' servitude with Mr. Thomas Lawrence, of Winterbourne Court, the premium of . . . . . | 3 |
| John Woodman, for 25 years' servitude with Mr. Colthurst, premium of . . . . .                                    | 2 |
| Benjamin Ball, of Worle, for bringing up six children without parish relief, the premium of . . . . .             | 3 |
| John Stockdon, Iron Acton, for bringing up five children without parish relief, a premium of . . . . .            | 3 |

|                                                                                                                                                      |   |
|------------------------------------------------------------------------------------------------------------------------------------------------------|---|
| Elizabeth Lee, for 32 years' servitude with Mr. William Taylor, of Henbury, the premium of . . . . .                                                 | 4 |
| Mary Hawkins, for 15 years' and upwards servitude with Mr. Edwin Allies, of Westbury-upon-Trym, the premium of . . . . .                             | 3 |
| Henrietta Thomas, for 23 years' servitude with Mr. William Bushell, the premium of . . . . .                                                         | 2 |
| Edmund Baker, for having conducted himself to the satisfaction of his master, Mr. Mullins, Chewmagna, during his apprenticeship, bounty of . . . . . | 2 |

Mr. Beard's premium of 2*l* for the discovery of the best method of preventing the fly striking sheep, was awarded to Mr. C. C. Hardwick.

### IMPORTATION OF THE BONES OF CETACEOUS ANIMALS FROM THE POLAR SEAS FOR THE PURPOSES OF MANURE.

The great consumption of bones occasioned by the increasing demand for bone-manure in the extension of turnip husbandry to the more remote and inaccessible parts of the country, accompanied with the small indeed, but gradual, rise in the price of that valuable means of fertilizing the soil situate at a distance from large towns, naturally creates the apprehension that at no distant period the demand will outrun the supply. In order to anticipate such an "untoward event," our thoughts have lately been turned to a prolific source of supply which has hitherto been almost entirely overlooked—we mean the Polar Seas. Much valuable bone might be brought home in the whale ships from those regions. One large whale might afford several tons of bones. We are quite aware that while the prospect of an abundant supply of blubber arrests the attention of the whale-fisher, he will be regardless of the bones of the animal. This state of mind is natural. The fisherman, when so actuated, only fulfils the principal object of his voyage, and were he always certain of loading his ship with the most valuable part of the cetaceous animals which he captures, no one should be so unreasonable as to request him to direct his attention in the short time he has to accomplish his object, to any other subject. But we all know how very seldom whalers bring home bumper ships, how much more frequently the ships are only half loaded; while every year some come home clean. Now some of their time might be profitably, at least usefully, employed in securing a quantity of the bones, such as the jaws, ribs, and vertebrae of the animals which they capture; and although it would not be desirable to occupy the most convenient parts of the ship with bones, while there was a prospect of obtaining blubber, it should be remembered that no bones can be obtained without in the first place securing the blubber. It will, no doubt, not unfrequently happen that the most successful periods of the fishings are those when the capture of whales takes place faster than the blubber can be removed from the carcass and stored by; and we have heard a whaler assert that they have had fourteen carcasses floating alongside awaiting the process of fleecing. But if the whole bodies can be kept floating alongside to await the convenience of the crew to remove the blubber, cannot the fleeced bodies in like manner be kept floating till it is convenient to disengage some of the bones? Bones are easily disengaged, and would be of easy stowage. They could be cut into junks with cross-cut saws made

for the purpose, and many of them used as wedges to secure the butts in the hold, while others could be stowed away in any space in which a butt cannot be stowed. In this manner any ship could bring home many tons of bones; and it might be an understanding among the masters of the ships on the fishing ground, that if one ship was much taken up with the storing of blubber, while another was less successful, the latter might get leave to tow away the fleeced carcasses to their own ship. We have heard it stated that the bringing home of of bones would be a question of freight with the owners of the ships. We think this is a mistake, for the mode in which whale-fishers are paid has no reference to freight. They are paid according to the tons of blubber which they bring home. Some bones have been brought home of late years; one ship from Leith last season we saw brought four or five tons; but what is that trifling quantity compared to what she might have brought when she came home little more than half laden? The mode adopted by the owners for paying for bones, is to give the crew one-fourth of their value, so that the question of freight has nothing to do with the matter. We wish the owners of the whale ships from Scotland would seriously take this matter into consideration, and encourage their crews to stow as much bone as they conveniently can at their leisure. The value realized by the bone might not only pay the expenses of delivering the ship, but it might even reimburse the owners for the loss of the bounty, over and above the value of the blubber in an average voyage. If a premium of a piece of plate from the Highland Society would be any stimulus to the captains who would bring home the greatest quantity of bones, and thus forward our views for the benefit of agriculture by a constant supply of a cheap and efficient manure, we are sure they will be happy to grant such a prize to the successful competitor, and the owners we are assured would be proud that it was one of their ships which had carried off the honoured prize.

#### HEREFORDSHIRE CATTLE.

The Herefordshire white-faced breed, with the exception of a very few Alderney and Durham cows, have almost exclusive possession of this county. The Hereford oxen are considerably larger than the North Devons. They are usually of a darker red; some of them are brown, and even yellow, and a few are brindled; but they are principally distinguished by their white faces, throats, and bellies. In a few the white extends to the shoulders. The old Herefords were brown or red-brown, with not a spot of white about them. It is only within the last fifty or sixty years that it has been the fashion to breed for white faces. Whatever may be thought of the change of colour, the present breed is certainly far superior to the old one. The hide is considerably thicker than that of the Devon, and the beasts are more hardy. Compared with the Devons, they are shorter in the leg, and also in the carcass; higher, and broader, and heavier in the chine; rounder and wider across the hips, and better covered with fat; the thigh fuller and more muscular, and the shoulders larger and coarser.

Mr. Marshall gives the following account of them: it is tolerably correct, but does sufficiently

distinguish them from their kindred breed. "The countenance pleasant, cheerful, open; the forehead broad; eye full and lively; horns bright, taper, and spreading; head small; chap lean; neck long and tapering; chest deep; bosom broad, and projecting forward; shoulder-bone thin, flat, no way protuberant in bone (?), but full and mellow in flesh; chest full; loin broad; hips standing wide, and level with the chine; quarters long, and wide at the neck; rump even with the level of the back, and not drooping, nor standing high and sharp above the quarters; tail slender and neatly haired; barrel round and roomy; the carcass throughout deep and well spread; ribs broad, standing flat and close on the outer surface forming a smooth, even barrel, the hindmost large and full of length; round bone small, snug, and not prominent; thigh clean, and regularly tapering; legs upright and short; bone below the knee and hock small; feet of middle size; flank large; flesh every where mellow, soft, and yielding pleasantly to the touch, especially on the chine, the shoulder and the ribs; hide mellow, supple, of a middle thickness, and loose on the neck and huckle; coat neatly haired, bright and silky; colour, a middle red, with a bald face characteristic of the true Herefordshire breed."

They fatten to a much greater weight than the Devons, and run from fifty to seventy score. A tolerable cow will average from thirty-five to fifty score. A cow belonging to the Duke of Bedford weighed more than seventy score; and an ox belonging to Mr. Westcar exceeded one hundred and ten score. They are not now much used for husbandry, although their form adapts them for the heavier work; and they have all the honesty and docility of the Devon ox, and greater strength, if not his activity. The Herefordshire ox fattens speedily at a very early age, and it is therefore more advantageous to the farmer, and perhaps to the country, that he should go to market at three years old, than be kept longer to be employed as a beast of draught.

They are far worse milkers than the Devons. This is so generally acknowledged, that while there are many dairies of Devon cows in various parts of the country, (none of which, however, are very profitable to their owners,) a dairy of Herefords is rarely to be found.

To compensate for this, they are even more kindly feeders than the Devons, and will live and grow fat where a Devon will scarcely live. Their beef may be objected to by some as being occasionally a little too large in the bone, and the fore-quarters being coarse and heavy; but the meat of the best pieces is often very fine-grained and beautifully marbled. There are few cattle more prized in the market than the genuine Herefords.

The Devons and the Herefords are both excellent breeds, and the prejudices of the Devonshire and Herefordshire farmers for their peculiar breed being set aside, a cross of the one will often materially improve the other. The Devon will acquire bulk and hardihood, and the Hereford a finer form and activity. The Hereford bull, and the West Highland or Kyloe cows, have been tried, but they did not feed so rapidly, nor weigh so well as the Here-

ford, and they had the defect of being extremely pugnacious.

Mr. Culley, although an excellent judge of cattle, formed a very erroneous opinion of the Herefords when he pronounced them to be nothing but a mixture of the Welsh with a bastard race of long-horns. They are evidently an aboriginal breed, and descended from the same stock as the Devons. If it were not for the white face, and somewhat larger head and thicker neck, it would not at all times be easy to distinguish between a heavy Devon and a light Hereford. Their white faces may probably be traced to a cross with their not distant relations, the Montgomeries.

The Hereford cow is apparently a very inferior animal. Not only is she no milker, but even her form has been sacrificed by the breeder. Herefordshire is more a rearing than a feeding county, and therefore the farmer looks mostly to the shape and value of his young stock, and in the choice of his cow, he does not value or select her, or breed from her according to her milking qualities, or the price which the grazier would give for her, but in proportion as she possesses that general form which experience has taught him will render her likely to produce a good ox. Hence the Hereford cow is comparatively small and delicate, and some would call her ill-made. She is very light-fleshed when in common condition, and beyond that, while she is breeding, she is not suffered to proceed; but when she is actually put up for fattening, she spreads out, and accumulates fat at a most extraordinary rate.

The breeder has been taught by experience, that when the cow, although she should be somewhat *roomy*, is too large and musciline, the ox will be brawny and coarse, and perhaps a little sluggish at work, and even somewhat unkind and slow in the process of fattening, and these are objections which, most of all, he would be unwilling to have justly made. The Herefordshire cow is therefore somewhat undersized; and it not unfrequently happens that she produces a bull-calf that grows to three times her own weight.

Kindly as the Hereford ox fattens, very few are grazed in their native county: even the beasts which the home consumption requires are principally heifers and old cows. The oxen are sold at five and six years old in tolerable condition, at the Michaelmas fair in Hereford, to the graziers of Buckinghamshire and the neighbouring counties, by whom they are principally preferred for the London market.

The fertility of the soil in Herefordshire has been very much overrated. The traveller, and the superficial observer, have been misled by the luxuriant woods and rich alluvial soil upon the banks of its rivers. The pasture-grounds are generally poor, and the herbage is not nutritious, and therefore the farmer naturally confines his chief attention to his rearing-stock. The dairy has been comparatively neglected; for experience has proved that the breeding qualities of a cow are materially lessened, and even her form is deteriorated, by her being inclined to give a large quantity of milk.

A very interesting trial was made in the winter of 1828,29, between the Herefords and the improved short-horned breeds of cattle, in the or-

dinary mode of feeding, without forcing by artificial food of any description, and the result seemed to be much to the advantage of the Herefords, considering their original weight, and the quantity of food consumed. It must, however, be confessed, that it is not sufficient to enable us to decide upon the relative merits of the two rival breeds of large cattle, nor are we yet quite prepared for the inquiry; but we insert it as an experiment that was fairly conducted, to which the advocates of the Herefordshire cattle often refer, and which they will naturally expect to be placed upon record.

Three Herefords and three short-horns were selected; they were put together in a straw-yard on the 20th of December, 1827, and were fed in the open yard, at the rate of one bushel of turnips per beast per day, with straw only, until May 2, 1828, when their weights were taken, and they were sent to grass.

On the 3d of November they were taken from grass, and put into the stall, when their weight was as follows:

| Herefords of .....                    | 13 2 14 |
| And in favour of the Short-horns..... | 17 2 0  |

And making a difference in the Short-horns of.... 3 3 14

But then the Short-horns had consumed 12,775lbs. more of turnips, and 1714lbs. more of hay.

When they were all sold together at Smithfield on the 30th of March, the heavier short-horns fetched 97l., and the lighter Herefords 96l., being an overplus of only 1l. to pay for the enormous difference in the food consumed, and the greater price given on account of the heavier weight of the short-horns at the commencement of the experiment.\* Another Hereford and a short-horn were also tried together at the same time; but they did not undergo the same process, nor was so regular an account kept of their progress. The Hereford increased in weight 3 cwt. 3 qrs., and the short-horn 4 cwt. 1 qr.

\* The Michaelmas cattle fair at Hereford is not exceeded by any show of beasts in good condition in the kingdom. They are usually sold to the graziers in the neighbourhood of the metropolis, by whom they are prepared for the Smithfield market.

There is an entry in an account book kept by William Town, in the neighbourhood of Hereford, in the year 1694, of the price of fat oxen at that period.

“25th August, 1694,—sold the nine oxen at 52l.; the money to be paid into the Exchequer within a month.” The price of oxen is, at least, six times as great now.

## ON THE POTATO CULTURE.

BY MR O. HALLORAN.

*(From the Irish Farmer's Magazine.)*

Gentlemen,—As the probable cause and remedy against a recurrence of the recent failures in our potato crops, which is the all-engrossing subject amongst your agricultural writers, will most likely ere long be developed to the public, from some of the numerous pens which must have been employed on the subject in another quarter—among which I have obtruded my humble contribution—as the cultivation of the potato may be supposed to be well understood already—and as your talented correspondent (Mr. Pooler) has ingeniously supplied the means by which the prolific crop of one season, may be made available to the exigencies attendant on the scarcity of another, it would appear an obtrusion of superfluous matter to offer any further opinions; however paramount the importance of the subject. But as my firm conviction is, that by disseminating a scientific but plain outline of the nature and habits of the potato, and the influence of atmospheric agencies on the plant amongst the generality of cultivators, any man who is capable of reading, may be capable thereby of trying experiments which would lead him to deviate from the dull routine of culture handed down by the predecessors of one generation to another, and pursue a more economical and profitable mode; I am therefore persuaded to offer, through the medium of your widely circulated pages, a few instructory remarks on the subject; accompanied by a brief account of a mode of culture which I tried with success last season, and which I have not heard of being adopted elsewhere.

Before we enter on the subject of the potato, it may not be improper to impress on the mind of the cultivator that minute observations have proved, that there is a constant circulation of ascending and descending sap from the roots to the herb, flower, and fruit of the generality of plants, which is analogous to the circulation of blood in the veins of animals; that this circulation commences in the roots or fibres, and ascends, *by the agency of solar attraction*, in a liquid state, through sets of minute vessels or tubes, on the same principle as water is exhaled from the earth by evaporation, until it ascends to the body of the plant and leaves, where it is acted upon and *changed to another substance* by the influence of light, air, and other atmospheric agents, and descends—*probably by night when the attraction of the sun is least powerful*—by certain sets of vessels, until it meet its destination by depositing itself in various forms and in various parts of the plant, and becomes the food or luxury of man, which is its ultimate object.

I am aware that some are not converts to such theory as this; but without discussing more widely so important a point, it is as sufficient as it is necessary for our present subject, to adduce as a corroborative instance, the plant in question—the potato. Let any cultivator, who has a desire to inform himself, watch the progress of a few tubers after being planted, and he will find that each shoot in protruding to the surface establishes in its ascent, two, three, or more sets of fibres at as many joints, according to the distance it has to penetrate, which fibres are intended by nature to search for nourishment for the plant at a future period; and that the embryo tubers are also formed at an early stage on each of these succeed-

ing joints. Let the observations be pursued until the plant shall arrive at its full growth, and, at any part of the stalk above the surface, let it be cut across, and the tubes in the margin or outer part of the stalk containing the *ascending*, as well as the tubular cavity in the centre, containing the *descending* sap, but in a more congealed state, will be visible even to the naked eye. Let such cross sections be continued towards any of the joints below the surface, and the direction of the tubes, communicating with the fibres, which imbibe and convey the *ascending* sap, will be found to have a tendency *upwards*, while that of the other tubes or conduits which convey the *descending* fluid through the ligaments by which the tubers are attached to the plant, is *downwards*, and communicates with the centre. Thus unquestionably proving that the tubers or potatoes are only the depositories of the descending sap which nature has changed to another substance; and it follows, that such depositories will swell and enlarge only in direct proportion to the degree of nourishment afforded by the fibres. Nor is this the only palpable instance of such change of substance, which the potato can furnish; for the plant and fruit (or berries) are found by chemical analysis to contain a considerable portion of poisonous matter, and yet we find the tuber, which is composed of the sap which at that stage was poisonous, to be not only divested in part, if not wholly, of such pernicious quality, but we find it as wholesome as it is a nutritive food.

With these preliminaries let us next enquire what influence the atmosphere exerts on the growth of the potato, and see if we cannot derive practical instructions from an acquaintance therewith, as well as with the physical constitution and habits of the plant itself. It is evident to the most careless observer, that nature finishes her work not alone in the perfection of the potato as an article of food, but that she also provides for the re-production of the species by directing the functions of the sap contained in the tuber to the nourishment of a shoot until a new plant is capable of doing for itself; for every cultivator is aware of the simple fact, that a potato or part of a potato will, after being planted if in a sound state, make one or more shoots, the direction of which will be invariably *upwards*. This undeviating principle is effected by two causes—expansion and attraction—both of which are governed by the influence of the sun. Expansion is caused by the action of heat upon all expandible substances; and as the potato is no more in reality than the depository of the descended, but coagulated fluid, as observed before, so when solar heat begins to act upon it, it expands itself in the form of a shoot. And in the tendency of the shoot to direct itself upwards, it is governed by the principle of solar attraction. It is equally certain that a shoot derives little nourishment except from the mother tuber, until it penetrates to the light; (at which time a reciprocal motion will commence between the fibres and the plant) and the more abundant the store of nourishing sap retained in the tuber, the stronger and more luxuriant will be the shoot—hence the necessity suggests itself of planting large cuts, if not whole tubers, when deeply imbedded in the soil; or in early plantings, when the rays of the sun will be more feeble and consequently unable to attract the shoot so quickly to the surface.

Having such indisputable facts before us, we may easily infer, that the well-being of a crop depends on, and may be comprised under the following

particular heads. *First*, a free and unimpeded scope for the fibres to run through the soil in search of nourishment; for we see it is that nourishment, after being imbibed by the fibres in a liquid state, and circulated upwards through the body of the plant, that returns and swells the tubers in another form. *Secondly*, a combination of nutritive liquids—the extract or essence of manure—with the fluid which the fibres absorb, so as to give strength and fertility to the plant; for on the same principle as pure water is less nutritious for the human frame than other extracted liquids, so the existing on so simple an element is equally prejudicial to the frame of a plant, and unfit for the nourishment or increase of its tubers.—And *thirdly*, an unintercepted circulation of air, combined with the timely influence of rains, heat, &c.; and each of these heads are reducible to practice in the following manner:—

The *first* suggests the propriety of deep ploughing and pulverization of the soil, preparatory to a crop; of breaking or removing obstacles, such as clods or stones, that may impede the passage of the fibres; of an *undisturbed repose* for the fibres in their searches for nourishment; and of the covering being regulated according to the stiffness or friability of the soil, or the part of the season in which the crop may be planted. For instance, as we find it to be the attraction of the sun that causes the shoot to spring upwards, the lighter the covering the better, in *early* planting, when the sun is least powerful—except indeed that frost be anticipated. On the other hand, if the soil be stiff or cloddy, the covering will lose in compactness, and the fibres, established at successive joints in the ascent of the shoot, cannot come into such immediate contact with the earth or manure as might be in friable earth; consequently an unavoidable depth of covering would in this case be necessary, (and in such cases as this, strong cuts, if not whole tubers, should be invariably planted); but whatever the soil or the season, a sufficient depth should be allowed to enable the shoot to make two or three sets of such fibres (which may be about three inches); for the more fibres or *feeders* a plant has to nourish it, the more certain it will be of success.

The *next* proposes the proper application of manure. There is a difference of opinion with regard to putting the manure *under* or *over* the sets; but from the foregoing observations there may be some inferences drawn in favour of putting it *over* them; and I can say with confidence that the difference is discernable when reduced to practice. In the ascent of the shoot it naturally protrudes through the dung when placed over it; and its successional fibres will come in timely contact to receive immediate nutriment. Besides, if rain should succeed, it will dissolve the juices of the dung, and carry them with it in its descent to the fibres. On the contrary, if the manure be placed under, the fibres will have to descend perhaps two or three inches before they reach the dung, which delay would obviously prevent the immediate prosperity of the plant. The application of manure, indiscriminately through the ground, is in no case so commendable as in the detestable *lazy-bed* system; and if that indolent system has any thing to recommend it, it is only in the mode of applying manure. In that case the fibres, at whatever part they are formed on the shoot, in directing themselves downwards, will meet the manure in every direction, and will run horizontally through the manure; and the fibres at the base of the shoot near the tuber will draw early

assistance from being so contiguous to nourishment.—Hence we find crops of the *lazy-bed* system considerably earlier than those cultivated by more commendable methods.

By an observance of the *third*, we are prohibited from planting our crops *too close*, as that precludes the free admission of air and light, which are *indispensable agents to the prosperity of a crop*.

But though general outlines may be given with propriety, yet no specific rule can be given which is not subject to variation according to circumstances. Therefore it is, that every extensive cultivator should have a scientific knowledge of his subject.

If a farmer were scientifically acquainted with the nature of the potato, he would not adopt the monotonous routine of culture pursued by his predecessors or neighbours in every year, on every soil, and under every circumstance; he would on the contrary change his modes in various ways, as various matters may render it necessary. If, for instance, his soil were *poor*, and he deficient of a sufficiency of *manure*, he would plant his crop at the *usual* distance asunder; for in this case, as the deficiency of manure and richness in the soil would produce proportionably diminutive plants, and be a sure bar against the approximation of the stalks, so a large proportion of air, which is absolutely necessary, would thereby be preserved. Little do farmers, who pride in seeing their ground covered all over with stalks, conceive that it is the proximity of the stalks to each other, and the consequent exclusion of air, that draws them beyond their own strength, and that in being thus stretched beyond the limits of their resources, they are unable to return a sufficient maintenance to the tubers beneath. But were he provided with plenty of manure, and that his ground were naturally fertile, he would, in the expectation of luxuriant tops, apply a lesser portion of manure and plant at greater distances, and thereby provide also for a greater proportion of air. He would also take into consideration the individual variety he was about to plant; whether a *new* variety recently raised from *seed*, and from a *late* planting of the former season; or an *old* worn-out variety grown from an *early* planting of the previous season; for in the *former* case the tubers are invariably full of sap and vigour, which naturally gives them the propensity of making luxuriant stalks, and therefore should be planted further asunder; but in the *latter* the tubers are generally dry, farinaceous, and deficient of sap, and consequently their stalks are proportionately stunted, and need not be allowed such unnecessary room.

Last year I procured a few tubers of the imperial pink-eye, and though small the quantity I had, yet I was induced, from their being of a new and such extraordinary variety, to plant them experimentally. Amongst the rest of my trials, I selected four potatoes which weighed together  $2\frac{3}{4}$  lbs. and planted them *whole* at eighteen inches apart, occupying six feet of a drill. I cut  $2\frac{3}{4}$  lbs. more and planted them partly in continuation of the same drill, and partly in another beside it at one foot asunder in the row. The two drills were of equal length (sixteen feet), and three feet asunder. I put down *one* whole potato, which weighed in itself three quarters of a pound, in a single hole three by  $2\frac{1}{2}$  feet in extent. All were supplied with a good share of manure. I gave the drills the usual care of common culture; and the only care I bestowed on the single potato was, that I pegged down the shoots as they arose, divided them round, and covered them with a hillock of earth in the

centre: nor do I conceive this treatment absolutely necessary.—Now, though my single potato did not get *one-fourth* the manure applied to the drills—though it weighed not one-seventh of those planted in the drills put together—though the drills had the advantage of air at each side which an extensive crop could not have—and though their stalks when full grown covered *six times* the extent of ground that the single plant did, yet the advantage of the latter will be seen by the following. The produce from the whole potatoes in the drill was 14½lbs., that from the cut ones, 22½lbs., and that from the single potato, 12½lbs. The latter were large, clean, and even sized, while some of the former were small and unsightly. The portion of surface which the stalks of the single potato had covered, was about one-sixth of that which the drills had covered: and had I planted six single potatoes in the ground allotted for the drills, they would have produced, by this calculation, seventy-five pounds weight, or double the produce of the drills put together: and may we not expect an average proportion from more extensive crops?

There is another prevalent practice amongst farmers of running a plough through their drills, for the purpose of landing, as they call it, not perhaps until the crop is nearly in blossom—at a time when the fibres are in the vigour of their searches for the support of the plant, and when, without any respect for their necessary functions, they are disturbed, though at a season of the year when drought will prevent their immediate recovery. Now, that this is unnecessary, I have practical proofs; and that it is prejudicial, is my fullest conviction.

'Tis true, in most cases, landing is necessary—for instance, it protects a stalk, in some measure, from breaking at the surface by high winds: and if a variety of potato be prone to admit any tubercles at the base of the stem, these tubercles, if covered with earth, will certainly swell and become natural potatoes; but such application of mouldings should never be done at the expense of the fibres, whose office is to provide support for the plant and the tubers.

To remedy this, the potato crop should never be touched with the plough or the spade after being three inches high; at that period the drills may be softened with the plough and the spade, or the spade alone, at the same time applying a portion of landing. If more landing appear to be necessary, it should be done only with the hoe, when the stalks are about six inches high; and then for the season leave them to themselves and to nature, except in the removal of weeds.

I adopted a system of culture last year, which, though I have seen it frequently practised in broken ground, yet I have never seen it on *ley*.

At the extremity of a green field a line was strained, to the length of which a cut was made with the spade; at the distance of 2½ feet the line was removed, and another similar cut was made, and so on to the end. This being done, a sod or spit, ten inches broad and ten inches deep, was dug along each cut, with the grassy side left uppermost, and chopped in three or four parts. This being finished, the first drill which was dug was opened with a shovel, and its contents thrown aside; and the cuts were dropped along in this drill, with a small quantity of manure over them; (I should have said that the manure was laid on the ground after the drills were dug and previous to planting), then this drill was covered with the contents of the next, turning, with a twist of the

hand, the surface of grass which lay uppermost, and putting it close to the cut, whilst the friable earth below the surface was kept to cover the top. Thus did the work go on, the excavation of one drill covering another, until the crop was planted.

It is easy to imagine that after this was done, a space of eighteen or twenty inches, or a bone (as some would call it) of grass remained in every space between the drills, whose extraordinary appearance too, drew forth the ridicule of many old practitioners, who knew nothing of my intentions. At the lapse of three weeks, (when leisure permitted), those spaces were deeply dug, and the turf or grassy surface turned to the bottom, at which time, and not until then, did the plantation assume the appearance of tillage. It remained so until the stalks were four or five inches high, and then a landing was given *with a hoe*; for were I even desirous of landing them in the ordinary way, the sods turned down were not sufficiently rotted, and therefore could not be disturbed. The crop received no other treatment, and the difference of produce, compared with the bed system, will show the superiority of the plan.

Through the prejudices of some, who called themselves experienced potato planters, against my strange system, and through their deep-rooted bias in favour of old practices, I was induced to try a few lazy-beds, which I planted at the same time that I planted the drills. Every bed was equal to *three* drills, and each bed got three times the quantity of manure, with twice the seed, as the three drills put together; and in weighing the produce of each, there was somewhat *more* potatoes in *two* drills than in the beds, leaving the produce of one drill, or *one-third more*, in favour of the drills, on a given piece of ground, and that too of equal quality, and side by side.

It is easy to distinguish the reason of this additional produce; for the green sward when turned down, as well on the sets as in the spaces between them, became a mass of decomposed vegetable matter, and consequently a manure in itself; and further, I am inclined to believe that the fermentation it necessarily underwent, accelerated, in some measure, the growth of the young shoots. The fibres besides ran freely through, and collected abundant nourishment from this decomposed vegetable manure.

It is attended, 'tis true, with more labour than other methods more generally practised, but the increase of produce will amply repay for the additional trouble, and is, I think, particularly adapted for *con-acre* crops. For the persons whose unhappy lot it is to depend for existence on that objectionable system, are generally those who have not permanent employment otherwise, and the difference of labour to them is but of small consideration. The drills may be dug at any time in spring—indeed the earlier the better, and left so until the time of planting; (the plough may be used at this process with equal propriety), the planting may then, in due season, go on and be finished very expeditiously, and the spaces between may be left untouched until leisure permit—indeed until the crop appear above the surface. By this the cultivator may, in the meantime, attend his other employments, and may considerably gain in point of economy.

I feel I have trespassed already too far, and therefore must defer for the present any further remarks.

Prospect, Glasnevin, 2d February, 1835.

## A WAY-SIDE INN.

John Horney was a publican,  
 A man of many merits;  
 Though oft reminded of his *bier*  
 He always was in *spirits*.

An oculist most rare was John,  
 Without the student's trouble;  
 For those who enter'd once his house  
 Would leave it seeing *double*.

He lov'd to talk of politics,  
 Folks often wonder'd why;  
 Some said, to shew his wit—I think  
 He deem'd the subject *dry*.

John was no traveller himself,  
 Save on a turnpike road;  
 Yet those who sat too long with him,  
 Did find themselves *abroad*.

The "Spirit of the Times," to John,  
 Was the Spirit which he drew;  
 The "Signs"—the one above his head—  
 Was the only one he knew.

But oh! the Cider Shops he curs'd,  
 He thought they led to sin;  
 Like B——m, he wish'd them all turn'd out,  
 As long as he kept *Inn*.

John welcom'd all—at least I mean—  
 Who likely seem'd to pay:  
 No quarter did he show to those  
 Who knew no quarter-day.

If then the *shot* was not discharged,  
 The toppers kept aloof;  
 Their eloquence might *move* the spheres,  
 John's tap was *double-proof*.

His ledger was a large black board,  
 Hung in the chimney warm,  
 When, Cobbett-like, he drew a bill,  
 This board was his "*Chalk Farm*."

The tip-top travellers rattled past,  
 Which made poor John irate;  
 "I wish they'd stop, as once they did,  
 Like badgers for a *bait*."

But all must die, and John is dead;  
 "To that bourne is he passed,  
 From whence no Traveller returns"  
 So John's his wish at last.

He grew so fat in latter days,  
 By drinking strong black strap,  
 He never left his tap, till both  
 His legs were fit to tap.

On drops he liv'd—by dropsy died—  
 Peace to mine ancient host!  
 The clay will now oft moistened be,  
 Cheaper than at "prime cost."

April 3.

NOBODY.

During the last year, 759,200 head of cattle were sold in the markets of Poissy, Sceaux, and Paris, amounting in value to 57,055,800*f.*, of which Paris for its consumption contributed 39,422,224*f.* These cattle were brought from 40 different departments. The amount of the sums advanced by the *Caisse* of Poissy to the butchers to enable them to make their purchases was 41,000,000*f.* The product of the public slaughter-houses from 1st Sept. 1818, when they were first opened, to the 31st December, 1834, was 16,037,535*f.* The highest receipt was in 1825, producing 1,159,940*f.*; the lowest in 1831, the amount being only 892,420*f.* The general average receipt is 1,002,350*f.* per annum.—*Paris Advertiser*.

## FOREIGN EMIGRATION UNNECESSARY.

The *Manchester Guardian* says, "An experiment has recently been made in the neighbourhood of Manchester on a small scale,—the results of which may eventually become of some importance to the manufacturing districts, and of most vital consequence to those agricultural parishes in England which are now labouring under the evil of a redundant population, aggravated and confirmed as that evil has been by gross mal-administration of the poor-laws. When the Poor Law Amendment Act was under discussion, Mr. Edm. Ashworth, of Egerton, addressed a letter to Mr. Chadwick, in which he pointed out the great demand for labour which existed in Lancashire, and the desirableness of promoting the removal hither of the superabundant population of the agricultural parishes of the south, instead of permitting the void to be filled up, as it otherwise would be, by importations of Irish families, whose habits have a very injurious effect on the resident population." The article goes on to state that in consequence of a statement which appeared in the *Times* in December, signed by about 30 labourers of Great Bledlow, in Buckinghamshire, complaining of their low wages and scanty employment, a negotiation took place between the Commissioners and the parish officers of Great Bledlow, and a correspondence with Mr. Ashworth and Messrs. Grey, at Quarry bank, near Wilmslow, Lancashire, when four or five families who expressed their willingness to remove were conveyed to Messrs. Grey's, "where they are now in employment, and very highly satisfied with the change in their condition, as their employers are with them. They consist of twenty-four individuals in all, the greater part of whom are females. Some of them had been previously employed in the manufacture of thread-lace, and consequently were very familiar with the species of labour required in a cotton manufactory. Another family was shortly afterwards sent over to Messrs. H. and E. Ashworth, at Egerton. Before their removal, the father, Joseph Stevens, when in employment, which was very uncertain, received seven shillings per week, the highest wages given at Bledlow. His family consisted of a wife and eight children (four sons and four daughters.) At the best of times, the joint earnings of the whole family did not exceed 15*s* per week, and they were generally 12*s* and 13*s*. Such was their condition before their removal. Now, the father has been engaged for three years as a labourer, at 10*s* per week for the first year, 11*s* for the second, and 12*s* for the third. Four of the children, who are of sufficient age to be employed in a factory, have been engaged for the same term, at 20*s* per week for the first year, 25*s* for the second, and 28*s* for the third. So that, at the outset the income of the family has been raised from 12*s* or 15*s* per week to 30*s*, with a prospective increase of 5*s* per week in each of the two succeeding years; in which time also two of the younger children, who are now sent to school, will be of sufficient age to earn their own living. Since the arrival of these families, many other manufacturers, some in Manchester, but more in the surrounding country, where the scarcity of inferior hands in the factories is very severely felt, have written to the Commissioners to say that they shall be very glad to receive and give employment to a number of persons of the same description, and we believe that arrangements are now in progress, in several parts of the South and West of England, for sending hitherwards a number of families, now a burden to their parishes,

who will readily procure profitable employment in this neighbourhood. The extent to which that employment can be provided in Lancashire and Cheshire is at the present time very great, and when the new mills which are now in course of erection shall be completed, the demand for labour will be still more extensive. In the neighbourhood of Stalybridge alone there are said to be mills now building which will furnish employment for at least three thousand *working* people; so that an additional population of at least six or seven thousand persons will be necessary in that quarter.—At Stockport the want of hands is also very great: the *Stockport Advertiser* says "Such is the scarcity of hands in the power-loom manufactories of this town, that five hundred additional persons could be put to work immediately if they could be obtained." Indeed, from all parts of the cotton manufacturing districts the statements are to the same effect: and it is tolerably clear that, without some extraordinary supply, many of the new factories cannot be worked. The agricultural districts of Lancashire, Cheshire, and Yorkshire, which have heretofore afforded considerable numbers of hands, appear to have been entirely cleared of their superabundant population; and have ceased to yield any further supplies; and there is, therefore, an excellent opening for those who may be disposed to remove from the south."

### RETROSPECT OF THE WOOLLEN TRADE.

The state of business in our markets for the last few weeks has continued to be highly satisfactory—the impulse communicated by the improvement in demand which occurred early in the year has yet lost none of its effect, but has acquired additional force with the advance of the season. Newly-made goods have found purchasers in our cloth-halls as fast as they have appeared, and the old stocks have been gradually diminishing. The operations out of the halls have continued to present an aspect equally favourable, but, in speaking of them, we must not be supposed to include all the "transactions in the warehouses," because the activity displayed in that branch of commercial enterprise is not always productive of commensurate public advantage. We may easily imagine a quick transfer of goods, to the amount of some hundreds of pounds, from one warehouse to the next door, and thence to another warehouse in the next street, without change of form or value, or any other change save that of place and hands. A movement thus indirect may be of advantage to the last purchaser, if it enable him to stock himself with cheap goods, and the sacrifice of price made by the seller may be no less advantageous to him if the produce of the sale place him in a favourable situation to stop payment just at the critical moment, and leave the unrequited original owner of the goods in the lurch. Such a case would exhibit much of activity, and of dexterity too,—much more, we apprehend, than would be admired by the sufferers, who would hardly like to be taught at such a cost that the practice of the Volls school is not yet quite exploded—that the race of Joshua is not yet altogether extinct. The operations to which we allude, on the contrary, are less partial in their effect; they have fair legitimate demand for their object, and the activity they produce imparts a substantial benefit wherever it extends its influence.

A state of things so gratifying affords few ma-

terials for public comment so long as its permanent existence be not threatened, and we can perceive nothing in the present real posture of commercial affairs which ought to excite alarm on this head. We have passed through a long period of stagnation and difficulty which has taught us the necessity of circumspection in our proceedings. The speculative rage for high prices was our bane; the re-establishment of moderate prices has been our antidote; and it will be hard if we suffer the dearly-bought lesson of experience to be thrown away upon us. But we are arrived at a period of the year which is always a critical one as far as regards the wool trade. The three months immediately preceding the clip are a period of great anxiety both to buyer and seller. It is quite natural for all parties to look forward with much interest to the probable produce of the clip, upon which the value of all existing stocks so immediately depends, and just in proportion as that interest becomes excited, whilst the result remains uncertain, is the opportunity afforded to speculators and other interested parties for the exercise of their ingenuity. The absurd report circulated amongst us at this time last year and the year before, were, unfortunately, too readily believed to be readily forgotten. On both occasions we were assured that the produce would prove deficient, whilst our buyers would have to compete with an extraordinary demand from other parts. Yet, in both years the produce proved to be abundant, whilst the greater part of the excess continued regularly to find its way to this country as before. Reports have again been industriously circulated for some weeks past, and when we find them so nearly resembling their predecessors in feature and complexion, we are surely justified in receiving them with suspicion, as members of the same family, if not in rejecting them altogether.

We believe that on the present occasion no difference of opinion exists between the wool dealers and the manufacturers in this district as to the danger of again unsettling prices; both are alike convinced that, upon the continuance of moderate and steady prices depends the continuance of the prosperity we now enjoy, so that if deception be again practised it will have to embrace a wider range for materials to work upon than heretofore, when a great diversity of opinion prevailed upon this point, and the pernicious effect of fluctuations were not so generally understood. The clothiers, as a distinct class, are perhaps the most liable to be imposed upon by delusive representations of this nature. Their general rule of proceeding is to sell, not exactly according to the cost of their goods, but for a price at which they can replace them with a profit. Hence, let it only be impressed upon them, however falsely, whilst they are working round one stock of wool, that the article is a rising one, and that their next purchase will cost more, they will look for a corresponding advance upon their goods in hands; failing to realize such advance, they may then be expected to vent complaints of the inadequacy of the prices actually obtained, although such prices afford fair profitable remuneration upon the actual cost. Let the merchants next give ear to the constant reiteration of such complaints, they may naturally conclude that under such circumstances goods are a safe article to purchase to an extent beyond present wants, but with a speculative view to the supply of future demand, at an extraordinary profit; and this point gained, the infatuation may proceed, one party after another becoming involved in the maze, all stimulating each other in the wild career, until

the purposes of the first agitators become served at the expence of all the great interests of the community.

We have no certain data whereby the stocks of wools now in existence may be determined. We know the quantity imported, but as to the quantity used in a given time, we can judge of it only by reference to the general state of manufactures and trade in that time. Thus we find that in the last two years the importations of wool increased by about twenty millions of pounds, making the quantity imported in 1834 more by three-fourths than that of 1832. If, then, we look to the state of our manufactures during these two years, and find no evidence of a corresponding increase of consumption, we certainly ought not to lose sight of such excess in the late supplies, if we wish to form an opinion as to the probable relation which produce may bear to demand for the approaching season. Much stress has been laid upon the quantities of low rubbish from the Continent, which are said to have swelled the amount of importations in the early part of last year. Now the quantities entered for payment of duty, and the amount of duty received thereon, are stated thus:—

|                          | 1833.      | 1834.      | Decrease. |
|--------------------------|------------|------------|-----------|
| Quantity in lbs. ....    | 33,361,487 | 30,733,336 | 2,628,151 |
| Duty received thereon. . | £138,280   | £131,685   | £6,595    |

And the decrease in the quantity brought to charge being greater than the decrease in the amount of duty received, it follows that a smaller proportion of wool paid the half-penny per lb. duty in 1834, as being under the value of 1s per lb. than in 1833.

Coming back, then, to the question of consumption, we have at all events one element to guide us to a conclusion as to the probable increase. The quantity of goods manufactured for the home supply we cannot determine, but we have official accounts of the value exported, and if we there find an increase at all commensurate with the augmented supply of wool, we may admit that its appropriation is accounted for. It appears, however, that the declared value of woollen manufactures exported in 1834, was less by about half a million pounds sterling than in 1833, and that the average of these two years exceeded that of the eight preceding years, from 1825 inclusive, by about one million pounds, or in the proportion of one-fifth only. It is plain, therefore, that we cannot look to the supply of foreign demand for our manufactures as an adequate outlet for the extra supplies of wool which have been received. At the same time we are not aware of any thing in the state of our own population, as to numbers or circumstances, which could lead us to regard the supply of goods for home consumption, as sufficient to take off this excess of produce, and therefore, until more enlightened, or better informed, we must abide by the conclusion that considerable stocks of wool must yet remain on hand, ready to be brought out in competition with the coming produce, for higher or for lower prices, as the chapter of accidents may require.

The importations of wool thus far in the present year are only about two-thirds what they were up to the same period last year, whence we should suspect that the stocks abroad have, at all events, been pretty far sought into, in order to furnish the extraordinary supplies to this country. If so, whatever may be the amount of stocks held here at the present moment, we have but the new clip to rely upon for further supply to any extent. But, we believe, no apprehension need be entertained

as to scarcity. The season has been highly favourable for the sheep, and the clip of this year, both in this country and in Germany, is expected to prove abundant in quantity and good in quality. In two or three months the result will be shewn; in the mean time our manufacturers have only to continue the exercise of that caution which they have exhibited for the last nine months, and be the result what it may, they will have no reason to blame themselves. The chances of beneficial speculation at this moment, we are sure, will not be considered equal to the risks.

NOTICES OF NEW HARDY TREES.—The Gardener's Magazine for January contains an article relating to new hardy trees, deserving of general cultivation, from which we extract the following:—"Among the trees worthy of introduction every where are, the scarlet-flowered horse-chestnut, the new scarlet-flowered thorn, the *Cratægus tanacetifolia*, *Aronia*, and odoratissima, remarkable for their large yellow or coral-coloured fruits; the *Sorbus domestica*, and the *Diospyros Virginiana*, both of which have borne fruit freely, on trees only ten years planted, in Mr. Loudon's garden at Bayswater, the last summer; the *Pyrus vestita*, the noble tree of the genus, of which there is a fine stock at Messrs. Loddiges; the *Nyssæ*, all the species of which are beautiful small trees; the *Alnus cordata*, and the cut-leaved alder; the cut-leaved birch; the scarlet oak; the new *Lucumbe* oak; the new variegated evergreen oak, introduced by Mr. Veitch; the liquidambar, an old inhabitant of the nurseries, but a tree which ought to be in the margin of every plantation whatever, whether useful or ornamental; the *Pinus Cembra* and *Sabiniana*; the *Abies Douglasii*, a rapid growing tree; the *Abies Webbiana*, a kind of giant silver fir, and in short all the new species of *Pinus* and *Abies* that can be got. If our nurserymen were skilful in grafting these genera, in the herbaceous manner practised extensively by the French, we should have no want of young plants of all the rare pines and firs; of many of which there is at present hardly a plant to be got. That such grafted pines and firs will ultimately become large timber trees, is proved by the size which such grafted trees have attained in the Botanic Garden at Metz. It may seem superfluous to recommend the Cedar of Lebanon; yet planters ought to be reminded that this noble tree will under the same circumstances grow as rapidly as the common larch. Mr. Sang of Kirkaldy published this many years ago; and it may be proved at Kenwood, Lady Tankerville's at Walton, Claremont, Ascot Park, High Clere, and a number of other places. Among the new shrubs may be strongly recommended that beautiful evergreen *Escallonia rubra*; and where there is a conservatory wall *Escallonia montevidensis* may be also recommended. Tree seeds, like those of culinary vegetables, ripened remarkably well during the last summer both in England and America, and many sorts which are generally scarce and dear in the seed shops, are now abundant and comparatively cheap.

WEIGHTS AND MEASURES. — By an account which has just been returned to the House of Commons, it appears that the ten inspectors for the county of Middlesex, appointed under the new Act, have rejected 26,301 false weights, and 20,996 false measures; for which service, and marking 227,103 true weights, and 377,897 true measures, they have received in fees, 3,974*l.* 3*s.* 11*d.*

## TITHE AND TITHE BILL.

TO THE EDITOR OF THE TIMES.

Sir,—Although I differ from you totally as to the propriety of supporting the present Ministers, yet I am bound to admit that I never found a column of your paper devoted to the patronage of corruption. The communications of your correspondents are also admitted impartially. It is often said, one fact is worth a hundred arguments. I have the misfortune to be a small farmer, managing something above 100 acres, and applying to the management of my land all the means applicable for its profitable cultivation.

This moment I am returned from my barley-field, and while there, I saw our greedy parson send for the last wheelbarrow-full of Swede turnips, from a ten-acre field, which field was sown for the purpose of being partly eaten off by sheep, and partly drawn and carried away, for the purpose of feeding cattle in the stall. This mode of feeding, it ought to be observed, adds much to the increase of good manure; the turnip crop is obtained by a very costly preparation. Every part of it, therefore, withdrawn by the parson is a grievous loss, inasmuch as it robs the farm of every tenth load of manure obtained by this costly system. You are aware that when tithe is exacted in kind, as it is in our parish, the parson claims a tenth of all the crops which are gathered. When I have drawn up nine heaps of turnips, therefore, for myself, I have been compelled to draw one for my parson; he wished me also to be at the trouble of sending up (a mile distant) every time to inform him of my having done so! In addition to this very injurious claim, the parson demands tithe of the lambs dropped and fed in the same field, and also of the wool of the sheep fed therein, providing they are shorn in the parish. Now I think it will appear very evident, that the present mode of managing and cropping land is so totally different from that when tithes were originally granted, that the payment of them in kind now is onerous, oppressive, and injurious in the extreme. The present system of management by draining, by the application of bones, by artificial grasses, and by turnips, requires a great additional capital; the parson therefore now takes the tenth part of all the additional capital expended by this improved and costly process. A small six-acre field was added to my farm eight years ago. It had been in the hands of a poor man, who entirely neglected it; it grew nothing but weeds. Before cropping, I laid out 60*l.* in draining, cleaning, and improving the land. Two years ago I had for the first time a fair crop; the parson then came, for the first time also, for every tenth shock of wheat, claiming and exacting a tenth part of my capital to its proceeds, although he contributed nothing for ploughing, nothing for seed, nothing for reaping!

Never was there anything so inadequate, absurd, and futile as Sir Robert Peel's proposed Tithe Bill! Why, Sir, in our parish, as well as in many others, could we have prevailed with our parson, we might have had a voluntary composition long ago! When a man, however, is ill-disposed and malevolent, he will retain the collection of tithes in kind, in order to gratify his malevolence. He

will take a pleasure in vexing and thwarting the parish, thereby enjoying the gratification of his malignity. Petty oppressions by village parsons are more in number and more in magnitude than will obtain belief. From this proposed measure, in its present form, we may perceive the baneful effects of having men to work out the great measure of reform who are enemies to it in their hearts, who concede to the force of public opinion, and who, in that constrained acquiescence, are compelled to contradict all their former principles.

But now one word as to the church. In the parish of Lindby, notwithstanding the payment of tithes in kind, the offices of religion are, in my humble opinion, inadequately attended to. We have service in church only once on a Sunday; we have no singing—no Sunday School. Our parson we never see in any of our houses. He is, I believe, a sportsman; and although I make a point of occasionally attending the parish church, yet I prefer encountering the expense and inconvenience of travelling upwards of two miles to attend church service where it is administered, according to my view, more consistently and effectively. I do not dwell upon the numberless bickerings and disputes and magisterial applications which result from this tithe system—the parish is in one eternal broil. I make no inquiry as to the private character of our parson, I have only to do with what affects his ministerial character; but it is quite evident that the receiving of tithe in kind is not only prejudicial to the farmer, but unjust to him also in the application of his capital. I believe, moreover, that it has a manifest tendency to lower the church in the estimation of its members; and that to leave the composition of it to the voluntary acquiescence of unwilling parsons (as proposed by Sir Robert Peel's bill) will prove a mere delusion and mockery.

R. HOPPER.

## MILCH COWS.

The management of the milch cows is somewhat peculiar in this country. The cattle are a mixed breed, between the original African race and the European; and few of the cows will give their milk without allowing their calves to suck for some time. But as all the calves are reared to increase the stock, no inconvenience is felt from this circumstance. An oblong enclosure is made with strong poles fixed in the ground, with a pen at one end to confine the calves until they are wanted. Into this pen the calves are driven before the cows come home from grazing in the evening. The cattle being never housed, become excessively wild; and to catch and tie a young cow to her post in the 'kraal,' is a matter of no small difficulty, and sometimes not free from danger. On the first attempt to take hold of the calf in the field, the enraged cow generally runs furiously at the person who presumes to interfere in her family concerns, when he must take care to get out of her way with all convenient speed, or abide the consequences of a disagreeable collision with her horns. If he can succeed in catching up the calf in his arms, he is then safe from injury, on account

of his burden; which he may forthwith proceed to deposit in the pen, unmindful of the menacing gestures of the angry mother. But the worst part of his task still remains to be achieved—to secure the cow; and this is as much as two or three people generally can manage. The moment the animal perceives that an attempt is made to convey a noose round her horns by means of a long stick, and the attempt fails, she becomes so impatient and shy that it is necessary to change the point of attack. One of the people now endeavours, by means of the stick, to get the noose round her hind leg when she lifts her foot from the ground, which operation requires much dexterity. As soon as this end is effected, the thong used for the purpose is drawn tight by the assistants, and secured round one of the poles of the ‘kraal;’ when the animal becomes perfectly furious, bellowing, kicking, and plunging. Wo be to him that comes within the length of her tether! for, with inflamed eyes and tongue lolled out, she runs indiscriminately at everything that comes within her reach. But, taking advantage of her turnings, the people, who are secure from her rage behind the poles of the ‘kraal,’ gradually tighten the thong and confine her efforts until her leg is drawn up close to the pole, and they can venture to approach her head and fasten to her horns another thong, which is then conveyed round a pole on the opposite side of the ‘kraal.’ One thong is then slackened and the other tightened until the cow’s head is secured to her post, where she is allowed to fume and bellow till she is tired and becomes more manageable. At the time of milking, a boy stands at the door of the pen, and lets the calves out as they are wanted, for they soon learn to answer to their names. After allowing the calf to suck for a few minutes, they proceed to milk all they can get from the cow, which generally retains enough for her young. The quantity of milk the cows yield is in this part of the colony very inconsiderable. Twenty cows seldom give more than from twenty-four to thirty-six quarts at a milking; but it is generally very rich in quality. It is remarkable, notwithstanding the intractability of the other cattle, that the bulls have none of the ferocity of those in England.”—*Moodie’s South Africa.*

**A SLEEPING PARTNER.**—At the late assizes at Horsham, a clodhopper of the real Sussex breed underwent a sharp cross-examination by one of the learned counsel, in the course of which he was asked who his sleeping partner in business was. “My sleeping partner?” replied Hodge, scratching his head and giving his hat, which he held by the band in his other hand, another turn, and staring at the same time at his interlocutor, as much as to say I wonder what the deuce is coming next, “My sleeping partner?—I’ve got noa sleeping partner but Mary.” The Court was convulsed with laughter, and when it had somewhat subsided, the counsel resumed, “You say your sleeping partner is Mary?” pray who is Mary?”—“Why doesn’t thee know Mary?” rejoined the witness, grinning till his fat red cheeks almost closed his eyes, “why she’s my woife, to be zure!”

## THE FATE OF THE OAK.

The owl to her mate is calling,  
The river his hoarse song sings,  
But the oak is marked for falling,  
That has stood for a hundred springs.  
Hark! a blow, and a dull sound follows;  
A second,—he bows his head;  
A third,—and the wood’s dark hollows  
Now know that their king is dead.

His arms from the trunk are riven,  
His body all bark’d and squared;  
And he’s now like a felon driven,  
In chains to the strong dock-yard.  
He’s sawn through the middle and turned  
For the ribs of a frigate free,  
And he’s caulk’d, and pitch’d and burned,  
And now he’s fit for sea!

Oh! now, with his wings outspread,  
Like a ghost (if a ghost may be)  
He will triumph again, though dead,  
And be dreaded in every sea.  
The lightning will blaze about,  
And wrap him in flaming pride,  
And the thunder-loud cannon will shout,  
In the fight, from his bold broad side.

And when he has fought—and won,  
And been honour’d from shore to shore,  
And his journey on earth is done,  
Why, what can he ask for more?  
There is nought that a king can claim,  
On a poet, or warrior bold,  
Save a rhyme, and a short-liv’d name,  
And to mix with the common mould.

BARRY CORNWALL.

*Friendship’s Offering for 1835.*

MALT.—An account of the number of bushels of malt consumed by common brewers in each of the three years ending January 5, 1832, 3, 4, distinguishing the quantities separately consumed in England, Scotland, and Ireland:—

|               | 1832.      | 1833.      | 1834.      |
|---------------|------------|------------|------------|
| England ....  | 14,176,309 | 13,832,851 | 14,443,391 |
| Scotland .... | 818,208    | 885,038    | 934,390    |
| Ireland.....  | 1,493,392  | 1,543,265  | 1,683,285  |

The United Kingdom .. 16,587,909 16,261,154 17,061,066

The members of the Hurstperpoint Sparrow Club held their last meeting for this season, the 8th of April. The number of sparrows’ heads produced since November last is 5,855. The prizes were awarded as follows:—1st prize, Mr. J. Bull; 2nd ditto, Mr. N. Marchant, Little Park; 3rd ditto, Mr. Hider. The evening was spent with much hilarity, and many appropriate songs were sung on the occasion. The health of Samuel Goodman, Esq., was proposed by the chairman, Mr. N. Marchant, and drank with three times three. The aggregate number of sparrows’ heads produced by the members since the establishment of this club in the year 1831, is 19,777. Many other clubs on the above principles have been formed in different parts of the country, and no doubt much to the interest of the agriculturist.

### GREEN FODDER FOR CATTLE.

Whatever adds to the supply of food, and increases the comfort of the animals retained about the farm, or domestic homestead, is, or may be made, a source of profit to their owner. The new clover (*Trifolium Incarnatum*) is coming into repute, and we see more or less of it in many farms; the turnip-rooted cabbage, or rather kail (*Kohl-rabi*), ought also to be esteemed a very valuable adjunct, and be extensively cultivated. But there is a plant which comes in earlier than anything else, and produces a vast abundance of wholesome succulent herbage; that, strange to say, is never to be seen. There was a time when it promised to be generally known; but we believe that, being an advertised article, and therefore over-vaunted, the public expectation was too highly raised; and as disappointment attended many trials which were made of it, disgust succeeded, and prevented that patient investigation of the merits of the herb which alone could determine its real value. We allude to the prickly cress—*Symphitum asperifolium*.

This plant belongs to a genus of the *asperifolia* of the 5th Linnæan class. It is a native of Caucasus, and was introduced in 1799, as an ornamental herbaceous plant. The flowers are cylindrical, with a bell-shaped border. They emerge of a brilliant red tint, which changes to a beautiful sky blue. They are produced at the summit of the stems, on a sort of curved spike, and are very pretty; but the whole plant, which attains to the height of five or six feet, is coarse and bristly. If a few plants be put into good common garden or field mould at the present season, the roots will soon establish themselves, and increase by suckers so abundantly that, though little larger at first than primrose roots, they will extend in every direction, and produce a mass of foliage which will frequently be three or four feet in circumference in one season. The root is fleshy and mucilaginous, the young herbage juicy and nutritive; if the flower stems be permitted to rise, they become very coarse and disagreeable. The leaves may be drawn up or cut over very early in April, and at that period furnish a most acceptable supply to cattle, pigs, and horses. The plants continue to increase, and to yield abundance of green fodder, which may be cut over and over again till November. We have much to say experimentally on this subject, but must reserve our remarks for our agricultural notice at the close of the month.

### ST. MICHAEL ORANGES.

The orange plantations or quintas of St. Michael's, are of large extent, always encircled by a wall from fifteen to twenty feet high, and within a thick plantation belt of the faya, cedar-tree, fern, birch, &c., to protect the orange-trees from the sea breezes. The trees are propagated from shoots or layers, which are bent at the lower end into the ground, and covered with soil until roots begin to strike, when they are separated from the parent stem, and transplanted into a small excavated well about three feet deep, (lined with pieces of lava, and surrounded at the top by plantations of laurel, young faya, and broom), until the tender orange-plants are sufficiently strong, at which period the plantations immediately round them are removed, and each plant begins to shoot up and flourish, after which no further care is taken of it, beyond tarring occasionally the stem to prevent injury by insects; and it in time spreads out with the majestic luxuriance of a chestnut-tree. In this country it only requires seven years to bring an orange-plantation to good bearing; and each tree, on arriv-

ing at full growth, a few years after, will then annually, upon an average, produce from 12,000 to 16,000 oranges. A gentleman told me he had once gathered 26,000.

The crops are purchased previous to their arriving at a state of maturity by the merchants, who ascertain the value of the probable year's produce, through the medium of experienced men, and then make their offer accordingly. The men thus employed to value orange-crops, gain a livelihood thereby; and such is the skill whereto they attain, that, by walking once through a plantation, and giving a general glance at the trees, they are enabled to state, with the most astonishing accuracy, on what number of boxes the merchant may calculate. It becomes, however, quite a matter of speculation to the purchaser, as orange-crops are a very uncertain property, and subject to various casualties between the time they are thus valued and the gathering. For instance, a continuance of cold north or north-easterly wind will cut them off;—a violent storm will sometimes lay the whole crop on the ground in a night, or it may be entirely destroyed by insects.

Nothing can exceed the rich luxuriant appearance of these Hesperian gardens during the principal fruit months, namely, from November to March, when the emerald tints of the unripe and golden hue of the mature fruit mingle their beauties with the thick dark foliage of the trees; and the bright odoriferous blossom which diffuses a sweetness through the surrounding neighbourhood is quite delicious.

The present amount of oranges and lemons exported, is upwards of 120,000 boxes, and nearly 70 or 80 vessels are sometimes seen lying in the roads, waiting to carry them to Europe. Besides these, a large quantity of the sweet lemon is cultivated for the consumption of the inhabitants: it is produced by grafting the sour lemon on the orange, but it is tasteless and vapid, though esteemed salutary and refreshing by the natives.

There is a species of epicurism peculiar to the Azores with respect to oranges, particularly observed by the higher classes, who only eat that side which has been most exposed to the sun, and is, of course, in its fresh state, easily distinguished by the tint—a refinement we are unable to emulate, the colour being rendered uniform by age.—*Boid's Western Islands*.

MANNER OF MAKING PERSONS FREE AT ALNWICK, IN NORTHUMBERLAND.—Those who are to be made free, or, as the phrase is, *leap the well*, assemble in the market-place, very early in the morning, on the 25th of April, being St. Mark's day. They appear on horseback, dressed in white, with white nightcaps, and every man a sword by his side, attended by the four chamberlains, and the castle-bailiff, mounted and armed in the same manner. They then proceed, with music playing before them, to a large dirty pool, called Freeman's Well, where they dismount, draw up in a body, then rush in all at once, and scramble through the mud as fast as they can. After this they take a dram, put on dry clothes, remount their horses, gallop round the confines of the district, and then re-enter the town, sword in hand, and are met by women, dressed in ribbands, with bells and garlands, dancing and singing. These are called Timber-wastes. On this day, the houses of the new freemen are distinguished by a holly-bush, as a signal for their friends to come and make merry with them on their return. This manner of making free is peculiar to Alnwick, according to a clause in the charter given them by King John, who, travelling this way, stuck fast in a hole, and thus punished the town, for neglecting to mend the roads.

## POOR LAW COMMISSIONERS.— STOKE POGES.

Copy of a letter from the Poor Law Commissioners to his Majesty's Secretary of State for the Home Department; with a Copy of the Directions issued by them, and also a Copy of the Declaration by which the Eton Union has been formed.

To his Majesty's Principal Secretary of State for the Home Department.

Poor Law Commission Office, Somerset-house,  
March 17, 1835.

Sir,—The attention of the Poor Law Commissioners for England and Wales having been directed to a petition presented to the House of Commons from the inhabitants of Stoke Poges, they think it their duty to lay before you the following statement:—

The first plan for bringing the Poor Law Amendment Act into operation in the South of Buckinghamshire, which the commissioners had under their consideration, was the formation of a union, comprehending 29 parishes in the hundreds of Stoke and Burnham.

This proposal was objected to by many of the parishioners of Stoke Poges, by some, because it involved the necessity of building a new workhouse on Stoke-common; by others, because they deemed the interference of the commissioners to be altogether needless and uncalled for.

These objections were represented to the commissioners, both personally and in writing; and on the receipt of a memorial from the parish, the commissioners thought it their duty to re-consider the arrangement. Having done so, they resolved on dividing the proposed union into two parts, by which means they obviated the necessity of building the workhouse on Stoke-common, and prevented the paupers of Stoke from being mixed with the paupers of more distant parishes, which some of the inhabitants thought likely to prove injurious to their character and morals.

Thus modified it appeared to the commissioners that the union was liable to no valid objection. By any further reduction in size its management would have been rendered more costly and less efficient. Its boundaries appear to be natural and convenient; on the west and on the south it is bounded by the Thames, on the east by the county of Middlesex, and on the north by the line of the Beaconsfield hills. In the centre of this district the parish of Stoke Poges is situated. To have excluded it from the union would have disturbed and rendered imperfect the whole plan; and its position is such that it could not have been left out in the hope of annexing it more conveniently hereafter to some other union.

It is true that the parish is not quite so highly rated as some of the adjoining parishes; but no union can ever be formed by the commissioners if parishes are to be omitted solely because their present burdens, from temporary or accidental causes, may happen to be somewhat less than those of an adjoining parish. Whatever advantage Stoke may have in this respect, it will, when its average expenditure is correctly ascertained, continue to enjoy.

It will contribute to the repairs and management of the workhouse in the proportion which its average expenditure upon the poor for the last three years bears to the like average expenditure of the rest of the union, and it will only be charged with the relief of its own paupers, whether in or out of the workhouse.

As soon as the union is completed, a board of guardians will superintend the relief of the poor, and they will be aided by proper and efficient officers,

No unnecessary pressure on the paupers need be apprehended, as the commissioners have not deemed it expedient to enforce the provision contained in the 52d clause of the Poor Law Amendment Act, which enables them to direct that no relief shall be given to the able-bodied paupers except in the workhouse.

With reference to the workhouses, and the regulations to which they may hereafter be subject, it is necessary to point out, that the commissioners have not as yet issued, with respect to the Eton union, any positive rules for their management, though, as regards another union they are shortly about to do so.

In framing such rules they are guided mainly by the practice and experience of parishes in which well-regulated workhouses already exist, and they think it will be their duty to act on that principle. They know no reason why a system of workhouse management, which has been found on trial to be perfectly successful in the parish of Cookham (only a few miles distant from Stoke Poges,) should not be equally applicable to the workhouses in the union in which that parish is situated.

When applied to for information on the subject of workhouse rules, the commissioners have on all occasions said that they thought married couples should not be placed in different houses, that children under the age of nurture should not be separated from their mothers, and that the aged, infirm, and sick paupers should be treated with care and tenderness, and not of necessity be forced into workhouses, as they now generally are, in preference to the sturdy and able-bodied pauper.

With respect to the question which was in reality to be decided upon by the commissioners in reference to the memorial presented to them by the inhabitants of Stoke Poges, the commissioners were full aware of its great importance. It imposed upon them the necessity of deciding whether, because a portion of the inhabitants of a particular parish were disinclined to be included in a particular union, and desired to be left in the undisturbed management of their parochial affairs, it became at once the duty of the board to acquiesce. It appeared to the commissioners to have been foreseen and contemplated by the legislature, that parishes might frequently object to be included in proposed unions, and that Gilbert's Act having failed principally because there was no power to compel parishes to unite, the commissioners had expressly been intrusted with a power to overrule such objections.

The commissioners therefore having deliberately inquired into the situation and circumstances of the parish of Stoke Poges, and given to the representation of the parishioners the fullest consideration in their power, decided on including the parish in the Eton union, and they confidently believe that they have not erred in so doing.

Their attention has been drawn in a particular manner to the district in which the parish is situated, and their interference in the neighbouring parishes had been anxiously solicited.

The parish of Stoke Poges itself, though the pressure of its poor is somewhat diminished by the extensive charities and benevolent disposition of many of its inhabitants, must still be considered as heavily burdened for the support of its pauper population. The charge for the maintenance of its poor for the three last years for which the parliamentary returns are made up was as follow:—

|                |                |                |
|----------------|----------------|----------------|
| 1830           | 1831           | 1832           |
| 671 <i>l</i> . | 515 <i>l</i> . | 778 <i>l</i> . |

Out of a population of 1252, it appears by a recent return that 118 are paupers. Relief is stated to be allowed to the out-door paupers according to a scale

(a practice which in itself calls for a remedy, inasmuch as it is one of the worst which has been suffered to establish itself,) and the cost per head of the paupers in the workhouse exceeds 4s weekly, being nearly double the amount in well-regulated workhouses were ample provision is made for the poor. The state of the parish as compared with others in the union, may be ascertained by a reference to the accompanying table, with respect to which the commissioners lament that the returns are not complete to a later date.

Though as yet the commissioners have refrained from issuing any rules which should apply generally to the kingdom at large, they have thought it their duty to lay down certain directions for the guidance of Boards of Guardians, wherever a union of parishes is formed. A copy of these directions they have the honour to lay before you, together with a copy of the declaration by which the Eton union have been formed.

The commissioners have the honour to subscribe themselves, sir, your most faithful and obedient servants,

T. FRANKLAND LEWIS,  
J. G. S. LEFEVRE,  
GEORGE NICHOLS.

(The documents for regulating the unions follow.)

THE SEASONS.—Many philosophers have directed their attention to the period of the equinox, or, more correctly speaking, to that point of time when the sun enters the sign Aries, and passes into the northern signs of the Zodiac, *i. e.*, the 21st day of the month, for the real equinox, as to time, when the sun rises and sets at six, falls on the 19th, with few deviations. We cannot refer to the several hypotheses which have been advanced, but may be permitted to solicit the reader's attention to a *rule*, which has been founded upon the uninterrupted observation of a long series of years. A late clergyman of St. Peter's, in the Isle of Thanet, first communicated it to us, and his informant had witnessed its accuracy for above 60 seasons. "If at the period when the sun enters the vernal sign the wind be northerly, and particularly at any point between north and east, the barometer about 30 inches, rising, and the weather fine, the succeeding summer will, in almost every instance, be dry, and *vice versa*." During the course of the month of March the barometer ranged between 20in. 50cts. and 29in. 80cts. On the 19th, 20th, and 24th days only, it has risen to 30in. and a fraction. The wind had for the twenty days of the month varied between S. by W., and W. by N., and floods of rain, with storms of wind, were the prevailing concomitants. On the 21st day, however, the wind veered to north, and from that time it has tended to the east; but the weather has been bad, and the limits of the prognostic do not extend beyond two or three days before and after the 21st. There is, then, as attached to the summer of 1835, some ambiguity; however, the weather is improving, and the barometer has gradually risen, it being now considerably above 30 inches. We may then hope that the summer will, in general, be fine (with intervals of rain); and if it correspond with the season of 1832, the land will yield its abundant increase, and plenty compensate in a great degree for low prices.

The Society for the Encouragement of Arts, Manufactures, and Commerce, have voted their large gold medal to Edward Rogers, Esq., of Stanage Park, Radnorshire, for his extensive plantations in the county of Radnor.

## ON THE CULTIVATION OF SWEDISH TURNIPS.—By MR. GEORGE POWELL.

(From the Irish Farmer's Magazine.)

Gentlemen,—Permit me to lay before the readers of your most useful Magazine a method which I have followed with much success in the cultivation of field turnips. The soil is a strong brown clay (loam). The crop, the details of which, with your permission, I am about to submit, succeeded wheat and oats, which were off the land by the first of September. The stubble was ploughed immediately to the depth of five or six inches, and with any herbage which was on the surface, was rotted by the beginning of October, when the ground was harrowed and ribbed, or drilled into three-foot distances. The plough for this purpose being drawn by two powerful horses, and being of a good construction, brought a considerable quantity of the subsoil to the surface, there to be acted upon by the meliorating influence of the winter frosts, &c. In this state, and lying high and dry, it was permitted to remain until the beginning of March, when it was levelled down by the harrow, (some kinds of soil are too stiff to be levelled by the harrow, in which case the drills are split with the plough,) and cross ploughed to the depth of ten or twelve inches. Early in May it was harrowed, rolled, and again ploughed across the former ploughing—barrowing and rolling being repeated until the ground was perfectly pulverized; the drills were then opened at two feet six inches apart, and the dung being applied freely, was immediately covered in, and the summits of the drills being flattened in some degree by the roller, Swedish turnip seed, at the rate of 3lbs. to the Irish acre, was sown with the ordinary turnip-barrow. I have tried experiments by steeping turnip seed, and afterwards drying it by dusting it with flour of sulphur, but can perceive no difference, as the dry seed vegetates as freely when the ground is properly prepared, as that which has been steeped; nor does drought, even of long continuance, effect the crop; for the ground being properly pulverized retains the requisite degree of moisture. The proper season for sowing Swedish turnip is from the 10th to the 20th of May.

As soon as the plants have four or five rough leaves, the paring-plough is set to work, and goes pretty close to the plants. The hand-hoes (of which six will thin an acre in a day) then follow, by which the plants are thinned to twelve inches apart—weeding being as much the object as thinning, the hoes are to be plied well amongst the remaining plants. The thinning and weeding being completed, the horse-hoe passes between the drills, and the whole is finished by returning the earth to the sides of the drills which had been removed from them by the paring-plough. Some cultivators object to earthing turnips; but in my opinion it is a useful practice, and this for more reasons than one. In the first place, the earth preserves the manure from the parching effects of the sun's rays. Secondly, the water more readily escapes from the drills in winter. I should have observed that where practicable, the drills should run north and south.

So far on the cultivation of Swedish turnip.

A part of the stubble field adverted to above, I sowed on the 14th of September with winter vetches, at the rate of four bushels per acre: it yielded an abundant crop, and was off the ground by the 20th of May. The land was then ploughed and harrowed, and by means of the couch-harrow rendered quite clean; and before the first of June was sown with Aberdeen turnip, which yielded as large a

produce as the Swedes. Some of the latter weighed 14lbs. each; and in one portion of the field, where they were weighed, were found to average 7lbs. a bulb; in another 6lbs.—exclusive in every case of both the tops and tap-root. A white Norfolk turnip which happened to grow amongst the Swedish, weighed, exclusive of the tops and tap-root, 17lbs. Such, gentlemen, is the result of careful practice; and I refer those desirous of seeing specimens of the turnips, to Messrs. Toole and Mackey's seed warehouse, 41, Westmoreland-street, Dublin, where I have forwarded some for that purpose.

An acre of turnips as productive as mine usually are, will stall-feed twelve or thirteen beasts from the first of November to the first of March. This being the case, the advocates of stall-feeding with potatoes would do well to consider well their practice.

I shall conclude for the present with a few observations on preserving turnips.

I shall suppose that it is necessary to remove them off the ground on which they grew, in order to get in a crop of wheat in November. With this view let them be taken up, their tap-root cut off, but not their tops; let them be brought home, care being taken not to bruise them, and laid in the position in which they grew in a convenient field or yard out of the reach of cattle: or if the tops can be consumed at once, the bulbs may be piled in a shed or on the north side of a wall, in which case they will require turning once in three weeks to check vegetation. Turnips should by no means be permitted to remain undisturbed after the first of February, as they become greatly deteriorated by the effort to push up a stalk for seed.

Clonsilla, March 3, 1835.

#### LIABILITY OF FOREIGNERS TO TAKE PARISH APPRENTICES.

It will be remembered that at the last Leeds Borough Sessions, an appeal was tried—*Ries v. the Overseers of Leeds*,—involving the question of the liability of Foreigners domiciled in England to take parish apprentices, and that on the trial it was contended they were exempted by the statute passed in the reign of Henry VIII. A case has been submitted to Sir Frederick Pollock, the Attorney-General, and his opinion has been requested—

“Whether by the existing laws and statutes of England, Foreigners or Aliens, although not naturalized, occupying warehouses or other premises in Leeds, for the purpose of carrying on business therein, or occupying dwelling-houses, and not being occupiers of warehouses or other premises, are liable to take parish apprentices, and whether they are subject to such and the like penalties for refusing so to do as natural-born subjects of the King.”

To this question the Learned Knight has returned the following answer:—

“I am of opinion that Foreigners domiciled here, whether naturalized or not, are liable, in the same manner as natural born subjects, to the poor laws, and may be called upon to take apprentices, and would equally be liable to penalties for refusing to do so. I do not see how the statute of Henry VIII (referred to) forbids this, or is, in any way, inconsistent with it. The object of that statute was to prevent Aliens from having Alien apprentices, and to cause them to take as apprentices natural-born subjects who might learn and profit by their handicraft. Their taking apprentices under the poor law is quite in accordance with this object, if the parish children are (as probably they will be) natural born subjects.”

#### ON WATER MEADOWS CAUSING THE ROT IN SHEEP.

(From the Quarterly Journal of Agriculture.)

About the year 1808, some land, part of which had been under water, much of which was a bog, and part of which was nearly dry, was drained, levelled and irrigated. Although it was drained, and was so far dry that horses could at all times walk upon it, yet it produced coarse herbage, rushes, and even some flags. In this state it remained for at least fifteen years, and during the whole of the time, it was constantly fed on by ewes and lambs in the spring, and no instance was ever known of any of these sheep ever showing the slightest symptom of the rot.

As, however, the herbage was not good, and it was supposed that, by obtaining a better outfall, and a more effectual mode of drainage, the meadow might be much improved, it was broken up in 1829, drained more perfectly, better levelled, and was again laid down to grass after a turnip-fallow. The land then appeared to be perfectly drained. The turnips were excellent, and the grass which was sown in 1831 was beautiful. It was mown that autumn, after having been irrigated, and produced abundantly. It carried great flocks of sheep the ensuing spring, and produced a very great crop of grass early in the summer; but afterwards, in that year, the land appeared starved, and the grass did not come a second time to the scythe. In the spring of 1833, the meadow yielded a good pasture to the sheep, but, except in those parts which were dry and steep, it produced little for the scythe. Rushes made their appearance, and as it was probable that the land was not sufficiently drained, more drains were made, which produced a great deal of water. Then for the first time suspicions were raised that the sheep fed on the land were tainted by the rot, and it has been ascertained that, since Christmas 1833, sheep fed upon it have taken the rot in five days. In the spring of 1834, more drains were made in it. The consequence of which has been a great improvement in the quality and quantity of the herbage, but as far as the rot is concerned, it has been equally fatal to every sheep put upon it. It is necessary to add, that although the whole of this meadow is now so well drained, that, after a fortnight's irrigation, it will become so dry in a week, as to admit of horses galloping over it without scarcely leaving the print of their shoe; yet as some parts of it are much lower, and consequently nearer the water by some feet than others, it might be supposed that they would be more likely to produce the rot than those parts which are higher. But this is not the case. It has been ascertained that they are all equally infectious. Other meadows in this neighbourhood, irrigated partly by the same stream, have equally rotted the sheep though perfectly well drained. As those other meadows are entirely new, it cannot be said of them that there was a time when, though less well drained, they did not rot the sheep. They do not affect the question, what can be the reason why land which, when less well drained, was fed by sheep with impunity, rots them now, when it is much better drained?

It cannot be attributed wholly to the seasons; because other water meadows in the same county, but on a different stream, did not rot the sheep in the spring or even in the autumn of 1833. It is true that, in the spring of 1834, some few, out of very many, have been supposed to take the rot;

and that in the autumn of 1834, even on these meadows, scarce one has escaped the infection. But where they have taken it, some parts of the land have not been effectually drained.

These occurrences naturally excited attention, and recourse to every known means supposed to be capable of preventing this infection was resorted to. It has been said that sheep folded on fallows and not allowed to go on to their pastures till the dew was off the ground, have escaped the rot, when others which were allowed to remain constantly on them, have taken it; that dry food given to them on dry ground during the night; and that salt and oil-cake, have acted as preservatives. The evidence of the good effects of all these antidotes has been such as it was impossible to doubt. But each and every one of them has been tried here with the greatest attention, and it is painful to add, that they have all failed in *every instance*. The mode in which these experiments were made, was this: Out of a large lot of fat wethers which were in the course of being killed, and which were all believed to be sound, three at a time were selected for the trial of each of these remedies, and put on the meadows. At the end of three weeks, their livers were invariably found to be more or less infected, while the livers of the others of the same lot which had not been on the meadows, and which had remained in their usual dry pastures, remained unaffected.

This continued for some time; but at last two wethers which had *not* been on the meadow, were found to have diseased livers, and therefore it cannot be affirmed with perfect certainty that the subjects of the experiment had taken the disease in spite of the remedies; because it is just possible, that, like the two last, they might all have taken the infection at some previous period.

#### WESTSUFFOLK AGRICULTURAL SOCIETY.

The Show on Tuesday March 31, though not large, exhibited some beautiful stock. The prizes were adjudged as follows:—

- To the owner of the best Suffolk Stallion, 1st prize, £8.—Mr. R. Howlett, of Wyverstone.
- Second prize, £4.—Mr. G. Mumford, Lavenham.
- Best Brood Mare, 1st prize, £4.—J. T. Ord Esq.
- Second prize, £2.—O. R. Oakes, Esq., (much admired.)
- Best 3-year old Colt, 1st prize, £3.—Mr. Phillip Parker.
- Best pen of 5 fat Southdown Shearling wethers, £3.—W. Bryant, Esq.
- Best pen of any other breed, £2.—Mr. Geo. Beeton.
- Best Ox, bred in Suffolk, £2.—The Duke of Norfolk.
- Best Fat Ox, £3.—Ditto.

#### SWEEPSTAKES—SOVEREIGN EACH.

- Best Bull, any breed, won by Mrs. Stutter, Flempton.
- Best Suffolk Cow, won by Mr. Geo. Beeton.
- Best Southdown Hoggett Tup,—W. Bryant Esq.
- Best Breeding Sow, bred in Suffolk (half-sovereign each) O. R. Oakes, Esq.
- The Judges for the Horse Stock were—Mr. W. Adams, Mr. Giles Steward, and Mr. E. Futter—for Cattle &c., Mr. F. Nunn, Mr. G. M. Rodwell, Mr. S. Shillito, and Mr. George Mumford.

WATER.—Although our subject is far from exhausted, a few words on the amazing quantity of water upon the earth, and we have finished. 129

million square miles—more than half the surface of the globe—are covered, it is calculated, with water; and the quantity is said to be some thousand millions of cubic miles: from our ignorance, however, of the real depth of the sea, which has never been fathomed beyond one mile, any statement on this head must be hypothetical. Now, when we remember the amazing flood of water daily poured into the sea, from the various rivers and other sources, we are surprised that it does not overflow its cliffs, and ultimately swallow up the dry land; but it has been calculated by Dr. Halley, that every ten inches square of the ocean gives off one cubic inch of water in vapour every day, from which he estimates that 5,280 million tons evaporate from the Mediterranean Sea alone during a warm day, probably to supply these very rivers. All is changing, nothing remains at rest, whether our bodies, the earth that we inhabit, or the waters which surround it. The drop of water born to-day in the laboratory of the chemist, is dissipated by the heat of the apartment, and in the shape of vapour, is transported by the winds thousands of miles; it is congealed by cold, and descending in the shape of snow, assists to wrap up and protect the surface of the earth from the freezing blast; thawed by the sun of summer, it filtrates through the ground, and with its fellows, bubbles forth a spring from the mountain side; the spring may become a river, and the river, after passing through its destined course, empties itself into the ocean, bearing with it our drop of water, whence it is taken up by the atmosphere, again to pursue its round of usefulness.—So is it with all nature!—*Literary Union.*

#### DISCRIMINATION OF SOILS.

Nothing tends more effectually to confuse the tyro in horticulture, and to frustrate and disappoint his practice, than the misappropriation of terms. Amateur gardening has, of late years, extended amazingly, and whatever timid or selfish vendors of plants may imagine, it is quite certain that the extension of horticultural knowledge will, in proportion, encourage the progress of the nursery business, and increase the demand for plants. We happen to be acquainted with gardeners of the first order, and know that, so far from attempting to mystify their art, they speak without reserve, and describe any particular process with candour and liberality. Horticultural publications become every year more numerous, and keep pace with the rising spirit of enquiry; but no one can look over their pages without perceiving that, in as far as soils are concerned, there is much of uncertainty and confusion. We shall confine our remarks at present to one or more terms of very common occurrence. Formerly (that is about the commencement of the present century,) whenever a person who purchased a plant inquired of the nurseryman what soil was suitable to its habit, he was answered that loam, or “bog-earth,” or a mixture of the two, in certain proportions, would be suitable. We have on a former occasion, expressed our opinion of the indeterminate meaning of the word *loam*, and shall now, therefore, confine ourselves to the other staple earth above named. By bog-earth, the cultivators in the vicinity of London always meant to express that light, vegetable black mould, abounding with white silicious sand, which was obtained from Hampstead-heath, Sydenham-common, and other places where heaths abounded. No term could be more inappropriate, nothing could be more remote from than the soil of a bog or turbary; yet it was so far determinate, that it

had but one definite meaning. By the words *bog-earth*, then, *black heath-soil* was clearly understood. But of late this term has been nearly abandoned, and we everywhere read of *peat*, and mixtures of *peat* and *loam*, &c. But here confusion begins, and we have a right to inquire what is the true and legitimate meaning of *peat*. Strictly speaking, *peat* and *bog-earth* ought to express one and the same thing; that is, the earth of *peat*, *bogs* or *turbaries*, the deposits of masses of decayed vegetation, swamped with water. *Peats*, doubtless, differ more or less in their components, if chemically analysed; but the term has but one proper, definite meaning: yet we may ask, do those persons who mention the application of *peat* always imply the earth of *bogs*? We distinctly reply that they do not—that, in nine cases out of ten, they mean to express the light black, or brown, surface soil of *heaths*, abounding with sand; the soil, in fact, which the *ericæ*, and the greater part of shrubs usually styled “*American*,” delight in. But in some cases, *real peat*, the black, swampy, hard-binding earth of *bogs*, is not only implied, but is, in fact, the medium best calculated to promote the luxuriant health of some of our most beautiful plants. *Thunbergia* revels in pure *peat*; its leaves and flowers expand to double the dimensions which they commonly attain in loamy soils. The herbacious *calcicolarias* thrive well in a compost containing much *peat*, and so do a few other plants. But these may be quoted as exceptions to the rule; for it is our firm conviction that, by the term, now so frequently employed, they who use it mean to express the surface soil of the *heath*, not that of the *peat-bog*. Let us define our terms, and henceforward (as we hope to do ourselves,) when we wish to direct the use of what was called *bog-earth*, always designate it by its proper title, *heath-soil*, or *mould*, and we would recommend any amateur who wishes to lay in a stock of this most useful ingredient, to have it cut with the grass turf, and laid in square masses with the herbage downward, to moulder and blend together till they assume one homogeneous texture. Silver sand can be added at the time of using it, if the mould appear deficient in that ingredient. We tested a portion of soil from *Bagshot-heath*, and found that, in 100 parts, nearly 90 consisted of pure white sand, and with a little iron; the remainder was vegetable matter of decayed leaves destructible by fire. These proportions agree sufficiently with the analysis given in the “*Treatise upon Planting*,” by the Society for the Diffusion of Useful Knowledge, 1832, page 48, No. 1. *Peat*, on the contrary, contains at least 60 per cent. of vegetable remains, a considerable portion of protoxide of iron, and some alumen or pure earth of clay.

**ONIONS.**—As large and as mild as those imported may be produced by the following method:—“About the middle of February, the seeds are sown on a slight hot-bed, the covering of which being six inches of rich light soil; after the plants have come up, a full stream of air is admitted, in order to rear them hardy and stubby. A piece of an open quarter in the garden is trenched two feet deep, finely broken in the process and well manured; the surface trodden with the feet, raked level, and beaten smooth. About the middle of April the plants are very carefully lifted with their roots *entire*, and planted in the ground thus prepared, at fourteen inches apart, and ten inches in the line; the holes being made of sufficient size to admit the roots with ease at their full length, the bulb resting on the surface, and in the hoeing afterwards these must be covered. The

plants will be established by the middle of June, when, should the season prove dry, they must have copious waterings, desisting however about three weeks before they are taken up, that the sap may be concentrated, and the bulb hardened in the swelling off. By this method I have been enabled to raise bulbs weighing two and a half pounds; and I do not hesitate to say, that onions may be grown in our own country as large and mild as those imported from the Continent. The kinds that I sow are the Brown Portugal, Brown Spanish, James Keeping, and Tripoli. The soil is light, sandy, incumbent upon gravel. Should a hot-bed not be used, the sowing will require to be in the previous autumn.”

## ON JUDGING CATTLE BY MEASUREMENT AND WEIGHT.

(From the Quarterly Journal of Agriculture.)

To judge accurately of the quality and weight of live stock, is an acquirement which every farmer is desirous to possess; and which, when its importance has been appreciated, presents itself in an enticing form to every pupil of agriculture. It is, indeed, the highest accomplishment which a breeder of stock can acquire; for by it he can never fail to maintain his stock in the highest perfection. It is an accomplishment, however, which can only be rightly acquired by very extensive experience; but even with the most favourable opportunities of acquiring it, some men cannot become good judges of stock. The faculties of acute observation and discernment must cull judiciously from the lessons of experience, before men can acquire the character of good judges. Many breeders who profess to judge of stock aright, are not gifted with these natural faculties, although their perseverance may have rendered their acquirements respectable; but many more who do possess them will not take the trouble to acquire the requisite knowledge by the slow process of induction through experience. They must become judges intuitively, or not at all. Hence the experience which men employ to acquire that knowledge which can only be rightly acquired by experience. Hence the many tables which have been constructed by which the weight of live-stock may be ascertained by measurement,—the many rules by which their value may be calculated from their weight, when alive. Good judges condemn those rules and tables; and they are right, for they can ascertain the real weight of marketable flesh on any animal much more nearly by the eye than by any artificial rule, and the true quality of it by the touch, a property which those tables can give no idea of. Nor need the comparative superiority of the senses excite surprise. There are so many points on an animal which are requisite to be attended to in ascertaining its value,—this point depreciating it, that one enhancing it,—that the judgment must be exercised; but could the relative values of those points be easily ascertained by artificial rules, the judgment would be of no avail, the tape or the steelyard would universally become the substitute for the eye and the hand. Were the bodies of animals of a strictly mathematical form,—were they true cylinders,—and did the offals always bear an invariable ratio to the four quarters of flesh, then the tape and the steelyard would always tell accurately; but it is otherwise when the bodies of animals assume shapes of various proportions, the judgment then can alone ascertain their value, by comparing the value of the several disproportionate parts. It is nevertheless true that the real weight of animals possessing symmetrical and full-conditioned bodies, approaching the nearest to the mathematical

form, can be nearly ascertained by rule; but no rule hitherto known can be so explicitly relied upon in all cases as the judgment. Besides, the rules, however excellent in themselves, may not be judiciously applied. Every man cannot measure animals, nor even weigh animals aright. One inch measured too much or too little in the girth and length of a large animal, and particularly in both, will lead to a much greater error than any judge will commit with the eye. The accuracy of the live-weight depends in a great measure on the state of the animal, whether he is full or empty of meat. But neither measurement nor live-weight, however accurately taken, can give the least idea of the quality of the flesh; the eye and the hand alone must judge of this essential particular.

We have been led into these remarks by comparing the measurements and live-weight with the dead-weight of some of the largest oxen which were shown at the show of the Highland Society at Aberdeen in 1834, and observing in some instances the great disparity between them. Whether the disparity arises from the inapplicability of the tables to such great weights as were shown at Aberdeen, or from some inadvertency in measuring and weighing the cattle, we have no means of ascertaining. The rule for ascertaining the weight of an animal by measurement is to multiply the square of the girth taken behind the shoulder, by the length taken from the fore part of the top of the shoulder, in a straight line to the tail head, as far as the flesh of the buttocks extend; and this product by the decimal .258, which will give the weight of the four quarters in imperial stones. To ascertain the dead-weight by weighing, is to multiply the live-weight by the decimal .605, and the product will give the dead-weight of the four quarters in imperial stones. Both these rules have been tested by experiment. It was long thought that the dead-weight of the four quarters was just equal to half the live-weight, and we believe this opinion is yet prevalent among country people; and it must be confessed, this point has not yet been satisfactorily settled.

The first instance which we shall take to illustrate these rules, is Lord Kintore's large black ox. He was got by a pure bred short-horn bull, out of an Aberdeenshire horned cow, said to have had a slight dash of the West Highland blood in her. He was exhibited at the Smithfield show two years ago, and again brought down to Scotland, to be exhibited at the Highland Society show, at Aberdeen, on the 3d of October, 1834. He was seven years and six months old, when he was killed a few days after the show, by Mr. Roger, Crown-street, Aberdeen. His live-weight was 28 cwt., or 224 imperial stones. According to the generally received rule of the one-half, his four quarters should have weighed 112 stones, or by the rule of the decimal .605, which is considered by learned men as the correct thing, they should have weighed 135½ stones; but the dead-weight of the four quarters was 173 stones 4 lb. He was heavier in London, where he weighed, alive, 30 cwt., or 240 stones. His falling off is a matter of no surprise, when it is considered that, when he was slaughtered, two or three of his ribs were found to have been broken; and it is not improbable that this accident had occurred to him when he was sent to London. His tallow only weighed 16 stones 7 lb.; his hide, 8 stones 3 lb., a small weight of hide for an ox which measured round the girth 10 feet 3 inches: entrails, 126 lb.; blood, 84 lb.; head and feet, 64 lb.; heart and liver, 43 lb.; tongue, 14 lb.; and kidney collop, 5 lb. As another instance of the fallacy of the rule for live-weight, we will take that of a spayed heifer which was killed by Mr. Bos-

well of Kingcausie. She weighed, alive, 11 cwt., or 88 stones; the half of which would give 44 stones and by the decimal .605, 53 stones 3 lb.; but the actual weight of the four quarters was 49 stones. She was good, but not extra fat.

For the particulars of the following cattle, we are indebted to the kindness of Deacon Sparks of Aberdeen, who slaughtered all of them. Every one who was at the show, will remember the lot of five remarkably fine horned Aberdeenshire cattle exhibited by Mr. Sparks. The red ox exhibited by Lord Kintore was got by a short-horn bull out of a Dutch cow; was six years 8 months old; the four quarters weighed 142 stones 6 lbs.; the hide, 8 stones 6 lb.; and the tallow, 18 stones. The meat was rather inferior to what was expected.

The white ox exhibited by Mr. Boswell was a pure short-horn, and six years eight months old. He measured in girth 9 feet 3 inches; in length, 6 feet 2 inches; and the weight sent us was 15 cwt. 2 qrs. 17 lb., or 125 stones 3 lb. According to the old tables of Mr. Renton of Dykegatehead, a farmer in Berwickshire, that measurement should give 126 stones 9 lb.; those of Mr. Stewart give 117 stones; and those of Mr. Ainslie, land surveyor, 122 stones. The actual weight of the four quarters was 136 stones 10 lb., being 10 stones 1 lb. heavier than the highest tables, which, at 7s. per stone, would depreciate the value of the ox, when sold, 3l. 10s. 7d. The hide of this ox weighed 8 stones, and the tallow 29 stones 12 lb.; "being the greatest quantity," says Mr. Spark, "of rough tallow ever known to be produced by one animal here."

The two grizzled oxen, also exhibited by Mr. Boswell, were got by a short-horn bull, out of pure Aberdeenshire cows. They were six years eight months old, and had been worked for two years. The lightest coloured one measured 9 feet 2 inches in girth, and 5 feet 9 inches in length, the weight sent being 14 cwt. 1 qr. 14 lb., or 114 stones 4 lb. Renton's tables give for that measurement the weight of 117 stones 12 lb.; Stewart's 108 stones 3½ lb.; and Ainslie, 112 stones 12 lb. The darkest coloured measured in girth 8 feet 10 inches; in length, 5 feet 10 inches; the weight sent being 13 cwt. 1 qr. 25 lb., or 107 stones 11 lb. Renton's tables give 110 stones 9 lb.; Stewart's, 104 stones; and Ainslie's, 107 stones 10 lb. Mr. Sparks slumps the real weights of both these oxen at 32 cwt. 23 lb., or 257 stones 9 lb., the average of the two being 128 stones 11 lb. The average weight of the two exceeds, in this case, the weight of the heaviest, as given by the highest tables (Renton's), by 10 stones 13 lb.; that is 3l. 16s. 6d. in money value; and the weight of the lightest, as given by Stewart's tables, by 24 stones 11 lb., or 8l. 13s. 6d. of money value at 7s. per stone. The hides were 7 stones 7 lb. and 7 stones 12 lb., and the tallow of both 35 stones 4 lb. Mr. Sparks says, "these animals were most excellent meat, beautifully marbled, and superior to any of the short-horn crosses that ever appeared in our market."

The light red two year old ox exhibited by Mr. Boswell, was got by a short-horn bull out of a pure Aberdeenshire cow. He measured 7 feet 10 inches in girth, and 5 feet in length, the weight sent us being 9 cwt. 14 lb., or 73 stones. Renton's tables give 73 stones 8 lb.; Stewart's, 80 stones 3½ lb.; and Ainslie's 73 stones. The actual weight of the four quarters was 89 stones 10 lb.; that is, 16 stones more than two of the three tables has given; or in other words, this ox would have been sold for 5l. 12s. less than his intrinsic value, had the seller made his bargain by these tables. The hide weighed 6 stones 2 lb., and the tallow 14 stones 4 lb. Mr. Sparks

considers this was an extraordinary animal of his age." He was, without exception, the most perfect cross-ox we ever saw, shewing his points fully, and all of them well covered. Mr. Boswell has caused a lithographic print of his likeness to be made, but it certainly does not do him justice. We conceived him to be the most perfect animal on the show-ground.

These facts are important, in so far as they prove that the rules hitherto upheld as accurate for ascertaining the actual weight of beef in the four quarters of any ox, by measurement and weight, give results very far from the truth. All the tables are considerably below the truth, when applied to cattle exceeding 90 stones; and their effect is to injure the farmer, by valuing cattle above that weight below their intrinsic worth; and the same remarks will apply to the decimal rule of .605, and, of course, in a greater degree to the rule of one-half of the live-weight. The rules for live-weight seem to undergo a modification in their application to oxen of middling weight. That of the one-half is, then, against the farmer, and that of the decimal .605 against the butcher. The rectification of these rules and tables presents an interesting field, in which ingenuity may exercise its talents.

Mr. Sparks thus proceeds in his account of the oxen shown at Aberdeen:—"The ox exhibited by Mr. Lumsden of Keir, which gained the premium for the best ox of the Angus or polled breed, weighed, in the four quarters, 14 cwt. 26 lb., or 113 stones 12 lb.; hide, 8 stones 8 lb.; and tallow, 12 stones 4 lb. The meat was rough, and very unworthy of praise. Likewise, the ox exhibited by Mr. Lumsden, which gained the premium as the best Aberdeenshire three year old ox, weighed in the four quarters, 12 cwt. 2 qrs. 4 lbs., or 100 stones 4 lb.; hide, 6 stones 2 lb., and tallow 13 stones 9 lb. The meat did not shew the superior quality that characterizes the Aberdeenshire cattle. The five cattle I exhibited at the show, exceeded, when slaughtered, our most sanguine expectations for tallow and beautiful marbled meat. One in particular, a brown buckit, or down-horned Aberdeenshire ox, weighed, in the four quarters, 16 cwt. 26 lb., or 129 stones 12 lb., being an astonishing weight for the size of his bone. The hide weighed 6 stones 5 lb., and the tallow 19 stones 13 lb. The other four were proportionally such like." This buckit ox of Mr. Sparks reminds me of the axiom in breeding, "small in bone great in value."

The three fat pigs, not exceeding fifteen months old, which were also exhibited by Mr. Boswell, were sent alive by steam to London; and, although one of them fell sick on the voyage, they were sold for 17*l.*, averaging 52 Smithfield stones each. The two-year old boar which he exhibited and sent to London, along with the pigs, although not fed up for the occasion, nor looked very heavy, was 40 Smithfield stones.

**SWEDEN TURNIPS.**—One of the greatest difficulties which presents itself in bringing extraneous manure upon a farm, generally arises from the cost of conveyance consequent upon the bulk and weight. This evil may be avoided by using CLARK'S DESTROYED COMPOST, one hogshead of which containing 36 bushels, is sufficient top dressing for an acre of land, or if drilled in with turnips will suffice for two acres, and insure a good crop, pushing the young plant out of the reach of the fly much sooner than any other manure.

## ANIMALIZED CARBON, A NEW MANURE.

This substance is of French origin, and its manufacture is secured by patent. It was discovered by a French chemist; but that it is a substance easily manufactured may be inferred from the fact of its being shipped free on board for 35*s.* per ton. Mr. Joseph Owen of Copenhagen acquired the knowledge of the manufacture from the patentee in France, and has since established a manufactory on his own account in Copenhagen. His traveller, a Danish gentleman, was the first to introduce this new manure to the notice of the Scottish agriculturists. We have not had an opportunity of seeing a sample of it, but it seems it has been tried last year by Mr. Dalgairns of Inghinston, and of Mr. Inches of Cardean, who, we hope, will favour us with their opinion of its efficacy. We understand that the Danish gentleman has disposed of 250 tons of it in the counties of Forfar and Kincardine. Mr. Owen's card gives the following account of its nature, and the mode of using it:—

"The chief excellency of this manure is, that it is powerful in its effects, occupies but little room, is easily separated, and conveniently used either by hand or drill; its effects are farther to ensure a rich crop, by gradually ameliorating the soil, and rendering fallowing unnecessary. For wheat, rye, buckwheat, barley, and similar descriptions of corn, about 8 cwt. 1 qr. 16 lb. is used per acre: it may be either broadcast or drilled in before harrowing. For flax, hemp, beet, potatoes, &c. about 10½ cwt. per acre; and 12 cwt. 2 qrs. 10 lb. per acre for artificial meadows, different sorts of cabbage, rape, culinary plants, and for refreshing natural meadow land. For plants that are set in rows, a handful is put to each plant; for those which are transplanted, a child follows the planter, and throws a very small handful of the manure into each hole, which is immediately covered over with earth;—in several places for rape it is scattered out in rows along the roots of the plant, which the plough covers by forming a new furrow. On meadow land it must be spread out in December or January, when the snow is not on the ground. Generally speaking, it is well to mix the manure with half its quantity of finely sifted earth; but there is no necessity for pursuing this method. On light and warm soils about 2 qrs. 22 lb. less per acre is used than on cold or clay lands, where an extra 2 qrs 22 lb. are added to the quantity as before-hand directed to be used; it is, in fact, left to the farmer's judgment to make use of the above directions according to local circumstances. What characterizes this manure most is, that it develops its effects so slowly and gradually, that it may be applied, without danger in contact with the seed or roots of plants; in this it differs from a number of other manures which are less rich but more heating. In Scotland it has been tried in 1834 on eight different soils, has been found nearly equal to bone-dust for turnips, and has since been ordered in large quantities from the manufacturer, Mr. Owen, at Copenhagen, who delivers it free on board at 35*s.* per ton."

**BEES AT THE CAPE.**—A swarm of bees had attached themselves to the parlour window, occupying the space between the shutter and the glass. On inquiring about them, I found that they had taken a liking to the situation for several years, and always persisted in swarming there, although repeatedly driven away. After the fear of being stung by them was got over, I contemplated the labours of these little creatures with much pleasure, and they frequently afterwards occupied my attention. They are much smaller than

our bees, and appear to be far less irritable, and I was informed that they work during the whole year. They kept the house well supplied with honey, the comb being taken away about eight times in the course of the year, or about every six weeks. The hexagonal form of their cell did not seem to be the result of pressure, and were all of the same form both at the top and the sides. In the course of my observations of them I frequently saw them removing a portion of wax from one part of the comb to another.—*Voyage of the Chanticleer.*

### THE CURRENCY QUESTION.

The following extracts are from a powerful article, by Mr. W. MEDLEY, published in "The Agricultural and Industrial Magazine."

After contending most strongly, that the whole cause of Agricultural and Commercial distress arose from the alteration in the Currency, Mr. Medley proceeds—

"I have yet, however, abstained from furnishing you with proofs of the truth of my assertions. I at once begin:—The last great loan that was made during the war (1815), was contracted for at 56, and amounted to 36 millions; but the average price of all the loans during that period was under 63: that is, *sixty-three pounds sterling of paper money, or about three loads of wheat, were lent to the nation, for which we have been paying, during the last fifteen years, the exorbitant sum of 90 pounds,\* not in paper money (mark ye), but in gold, at 3l. 17s. 10½d an ounce*; in other words, we are paying *seven loads and a half of wheat for the three loads borrowed*.† This is the actual fact, impossible to be controverted, and is alone the cause of all our difficulties. Now, let this bargain be acted upon in private life, as it, in fact, has been, *unknown to the parties*,—and can we then wonder at the great and cruel suffering and sad vicissitudes of fortune that have been experienced during the last fifteen years; let any man carry his recollection back to the numerous respectable families he has witnessed during that period hurled from comparative affluence to ruin by this "hocus pocus" alteration and tampering with the currency. A nation borrows 550 millions sterling, receiving only 63 pounds for every nominal 100l so borrowed, and it is now endeavouring to repay the debt *in money at 90 pounds per cent.*; but in actual value *at one hundred and fifty pounds per cent.*‡—I mean the actual measured value of commodities, measured by the great staff of life, bread and meat, as it ought to be measured, and not by the value of gold. I will simplify it further: you will, I am sure, agree with me, that the 63l. received during the war would only then purchase three loads of wheat, to be made into bread for the supply of our immense army and navy during that period,§ and you will further agree with me, that the 90l. we are now paying the fundholder, will, at this

very day, purchase 7½ loads of wheat, in return for the three loads so lent us, *which, if measured in the actual value of the commodities at the time the bargain was made, makes us actually paying, as before stated, 150l for the 63l we have so received.* Now, were it possible to object to the measure of value being made in bread or meat, I would consent to its being measured by other commodities purchased during the war, viz., artillery or cavalry horses, cheese, butter, sail-cloth, clothing; in fact anything constituting the sinews of war. In all these cases the disproportion of value between what we have actually received, and what we are now paying, is enormous; and yet must an arbitrary and tyrannical law be made, to fix gold as the only standard of value, and gold, too, at 3l 17s 10½d per oz., although, up to the period of 1776, there was a double standard of gold and silver. I doubt whether insanity can be carried further; but after all, outrageous as these proceedings are, and at variance, too, with common sense and common honesty, no sooner is an attempt made to expose the wickedness and injustice of the measure, than we are immediately accused of a desire to violate the public faith; thus adding insult to injury. It reminds one of the outcry of a gang of coiners, pickpockets, or house-breakers, who, when detected in their acts of villany, coolly turn round and accuse you of robbing them. It may naturally be asked, if the case be so clear as I have now stated, why has not the evil been remedied before? I will tell you. At the time of the restoration of cash payments there was, in the House of Commons, a gentleman of the name of Ricardo, a celebrated stock jobber; and this man, having accumulated a fortune of seven hundred thousand pounds in a few years, was looked upon by the members of the then Bullion Committee (amongst whom was Mr. Peel) as a very great prophet, and a very great man. Well, *this great man*, (I think I hear his squeaking, but fatal voice, in the House of Commons now,) told this said Bullion Committee and the House of Commons, that the return to cash payments would only make a difference of 4 per cent; mark ye, *only 4 per cent!* And yet I heard this very man get up in the very same House two or three years afterwards, and acknowledged he had been deceived, for it had made, he confessed, a difference of 25 per cent. although a few minutes afterwards, he was dared, by Mr. M. Attwood, the talented member for Whitehaven, to deny that it had not made a difference of more than 50 per cent. The Records of the House of Commons will in a moment prove the truth of this assertion. Yet, in spite of this confession of the principal author of this iniquitous measure, that it had made a difference of *six times as much as he had anticipated*, and although, *in fact*, it had made cent. per cent. difference, the House of Commons refused even to inquire into the cause of this gross and fatal blunder; their answer now is, "*that it is too late to go back.*" God help them! I defy them to go forward without producing a revolution. *Too late to go back, indeed!* Can it ever be too late to repair an infamous injustice? Can they possibly imagine that the people of England, the agriculturists in particular, when made acquainted with the true cause of their long and extended suffering, will patiently submit to this cruel injustice and oppression?

MANURES.—"The merits of bone dust manure appear to be decidedly established in this quarter; it is particularly effective in light soils where it soon

\* Consols are now 92.

† Seven and a half loads of wheat, at 12l. per load, is 90l. exactly.

‡ The average price of wheat, during the war, being 20l. seven and a half loads would of course cost 150l.

§ If any doubt could exist on the subject, the various and enormous contracts, both for bread and meat, could be easily referred to, by which it would be seen that I have rather underrated than overrated the amount.

decomposes; in the heavier soils it is advisable to mix more or less dung with it. Mr. Morrison, factor at Clangregor, who has used this manure very extensively for turnip, applies at the rate of 25 bushels per acre; and in his communication, published in our Report of 1833, he recommends depositing the bones at 3 inches deep, and the seed along with them, as much of the success of a turnip crop depends upon the seeds being put pretty deep, and immediately among the fructifying matter, particularly in dry weather. In gravels, so small a quantity as 14 bushels per acre, dibbled in, has produced a good crop of turnip, which afterwards eaten off with sheep, has ensured excellent grain crops; this practice, it is considered, may be accomplished to a great extent and very profitably. When bones are left of the size of half an inch to an inch, they are called drill bones."—*Report of Drummond's Agricultural Museum.*

### SPAIN.

The arable land now under cultivation in Spain, is estimated at about 15,000,000 of English acres, which is double the quantity under tillage thirty years ago. Taking into account the fallows, it thus appears that about one-fourth of the area of Spain is at this time under cultivation. One half of the kingdom is supposed to be in pasturage, supporting 400,000 horses, 3,000,000 of horned cattle, and 18,000,000 of sheep. The forests of Spain occupy only one twelfth part of the surface of the country, and the remainder is made up of sterile mountains and of rivers.

Spain contained in 1723 about seven millions and a half of inhabitants. Its population is now very nearly fifteen millions, so that it has taken 111 years to double the number of its inhabitants. This increase, however, has not been in a regular scale of progression. From 1803 to 1826, a period of twenty-three years, the increase was 3,361,000 souls, showing an advance of 30 per cent. upon the number in 1803; according to which rate, the population would double itself in less than sixty years.

In regard to the agricultural productions, it appears, that they have increased during the last twenty years even more rapidly than the population. The quantity of corn now harvested suffices for the whole increased population, whereas, in 1803, the then inferior population had to look elsewhere to supply a deficiency of one-fifth of the quantity of corn necessary for its support. The quantity of grain now produced is estimated at twenty-two millions of bushels, which is nearly double the quantity yielded at the end of the last century. Horned cattle have not similarly increased. Although more than one-half of the kingdom is pasturage, there is only one horned beast to every five inhabitants, which is less than half the proportion in this country. Sheep have increased more than one-half since 1803. The flocks furnish annually nearly forty millions of pounds of wool, worth about 3,200,000*l*.

The annual consumption of meat throughout the kingdom for each inhabitant is not more than twenty-two pounds. The consumption, in the whole of France, is thirty-six pounds, and in Paris eighty-six. In the whole of Great Britain the annual consumption is ninety-two; and, in London, one hundred and forty-three pounds in the year for each inhabitant.

The total net produce of Spain, thirty years ago, arising from agricultural and industrious sources, was estimated at 34,420,840*l*, or 3*l* 8*s* 10*d* per in-

habitant. M. Moreau de Jonnés estimates the total present net produce at 48,759,160*l*. The expenses of production, which amounted to three-fifths of the gross value thirty years ago, are now lessened by the diminished cost of transport; but, on the other hand, the prices of agricultural produce are very greatly reduced. The foreign commerce of Spain is very little greater at present than it was fifty years ago. The total value of exports and imports in 1784 is stated at 5,727,040*l*, while in 1829 it amounted to only 5,867,760*l*. It should be observed that the foreign trade of Spain is greatly increased by the aid of smugglers, the sum of whose transactions has been roughly estimated to amount to one-third as much as the legalized trade.

### SYSTEM OF THOROUGH DRAINING AND DEEP PLOUGHING. — PROSPECTS OF BRITISH AGRICULTURE.

What is usually termed the soil of a country consists of two parts altogether distinct in character and functions. Before any accurate knowledge can be obtained of scientific agriculture, it is necessary as a first step to discriminate between the vegetable soil or mould—forming a portion of all soils, and the greater proportion of black earth; and the real earthy soil—that substance formed of gravel, clay, and other fine detritus, which holds or contains the vegetable mould.

The vegetable soil or mould is that portion of the compound soil which actually feeds the plant, that is, which the plant takes up and assimilates to itself; and where it is not present in proper quantities, or of the right kind, it must be supplied by manuring. The science of manuring, in fact, consists in the knowledge of the amount of mould already in the soil, and of the kind of manure wherewith in all the various circumstances of practical husbandry, the deficiency, where deficiency exists, ought to be supplied. In some countries there is an almost inexhaustible amount of this mould mingled with the earthy soil by nature. Where forests of hard wood are found growing—dating, for all that we know, from the epoch of the flood—the mould will have accumulated to a vast extent, as the annual fall of the leaves furnishes an annual supply of vegetable substance, which by rotting changes into it. Rivers also passing through such forests, bring down the rich loam, and deposit it upon the lower grounds, which thus acquire part of the capacities of the forest territories. It is the combination of both circumstances, in quite an unprecedented degree, which has so marvellously enriched America, and put all idea of the necessity of manuring—at least for the coming century—very far from the minds of the farmer on the banks of the Mississippi or the Ohio. In all lands, however, there is a large portion of the mould we speak of, also supplied by nature; and it is its prevalence which gives so much comparative fertility to our lowlands and carse. It is manifest too, that in countries where manure is abundant, the farmer who needs to supply it will have all possible advantage; and a thickly peopled territory necessarily affords sources of power to the cultivator, which no agriculturist in less favoured or less advanced countries can command.

But the earthy soil performs duties to the plant not second in importance to those of the vegetable mould itself. It is this soil which holds the plant—which permits it to stretch out its roots in search of nourishment, and which is the main agent in pro-

viding it with the requisite warmth. Now, in order to the right execution of these functions, this part of the soil must have certain properties. It must neither be too stiff nor too light: an error of the former kind is remedied by the addition of proportions of marl, and an error of the latter kind by the intermixture of clays. There is one quality, however, the most essential of all to the proper action of this soil; because, unless it possesses it, it cannot perform aright any one of the foregoing functions, nor would it be at all improvable. That quality is dryness. Unless the earthy soil possesses, or can be made to possess, the quality of absorbing or transmitting away in some direction, the moisture which falls upon it in the shape of rain, it is comparatively useless, and it needs no argument to prove it so. A wet soil, in the first place, is a cold soil—destructive to the plants by depriving them of the due amount of heat; it is totally incapable of holding the roots of the plants, as a single frosty night will be sufficient to make it throw out the young plants even after they are comparatively vigorous; and the attempt to increase the vegetable mould of such a soil by manuring must be always most expensive, because a great amount of it is all but sure to be run away.

The first thing to be done, then, in reference to the earthy soil—the achievement on which all others must be built, and to which, unless money is to be wasted, all others ought to be subsequent, is the production of this dryness. Various schemes for the accomplishment of this have been brought forward and practised, but the most complete, we will venture to say the only complete scheme hitherto devised, is that explained by Mr. Smith of Deanston in the second and third reports (but especially the third) of the Messrs. Drummond's Museum. The remarks just made have been suggested by the perusal of that admirable paper; and we have made them to show the important place in practical agriculture which ought to be occupied by such operations. That, we repeat, is the very first and most essential place; for why manure, until you can be certain that the manure will not be swept away? or why open or add body to the soil whilst you may only be preparing it for conversion into mud, or thick and stiff chilly clay? In reference to the latter kind of operations too, the draining we speak of opens up powers and facilities to the farmer which he cannot otherwise enjoy. Mr. Smith shows how the soil may be dried or made available to the full depth of eighteen inches, and a large body of earth thus brought into use and activity which in most cases is now lying an inert or soaked subsoil.

It is of course quite impossible to enter in this place on the minutæ or details of Mr. Smith's system, which has already been approved in practice, and we are happy to know by several intelligent Fife farmers; but we feel it a duty to refer the enterprising agriculturists of our great and rich county to the work which treats of it; and we have no doubt whatever as to what will follow from their attentive consideration of it. The operations recommended, must soon be very prevalent, and their adoption will constitute a great era, not only in practical husbandry, but in the agricultural position of Great Britain. Will any person with a farmer's eye take a glance over the Lothians, Berwick, Strathmore, Clydesdale, or Fifehire, &c., and tell us how much, on a moderate calculation, those corn-growing districts may be supposed to lose annually in consequence of the imperfect way in which their soils are thus fundamentally prepared? It is no exaggeration, that three-fourths of the soil of Fifehire might, by due attention to the process in question, be made to yield,

upon an average, one-half more than its present produce; and, looking to the whole country, we can scarcely think it a piece of an inventive enthusiasm, when Mr. Smith remarks, that, instead of fearing about corn laws, Britain has it in her power actually to take part in an exporting trade.

Farmers will naturally be anxious concerning the point of expense; and, with a view to gratify them on this matter, we subjoin a table given by Mr. Smith.

| Subsoils to which the distances are applicable.                                  | Distance between the drains in feet. | Roots per Acre, to landlord. | Cost per Acre to Landlord. | Cost per Acre to Farmer. | Cost per Acre to Farmer. | Total cost per Acre. |
|----------------------------------------------------------------------------------|--------------------------------------|------------------------------|----------------------------|--------------------------|--------------------------|----------------------|
|                                                                                  |                                      | s. d.                        | s. d.                      | s. d.                    | s. d.                    | s. d.                |
| For hard till sub-soil.....                                                      | 10 48                                | 4 8                          | 0 0                        | 1 8                      | 4 0                      | 12 0                 |

It will be noticed that part of the expense is here supposed to fall upon the landlord. The true principle of such distribution is this. If an improvement is likely to outlast, in its effects, the tenant's lease, the landlord ought to pay in proportion to this farther duration, and simply because he will himself be paid for it by the rise of rent on the next tenant. And inasmuch as real improvements yield a very great deal more than the money spent on them, the landlord as well as the improving tenant would always be a gainer. In the present instance, the great proportion of the improvement is permanent—the drains being constructed to outlast many leases; so that the part of expenditure laid by Mr. Smith on the purse of the proprietor is any thing rather than overmuch. But in as much as the result will pay both parties very satisfactorily, there is no need for too nice criticism on this point. When the spoil is large, the possessors do not quarrel concerning the destruction of trifles.

How plain is the moral deducible from the consideration of subjects like this, and how strange that our landlords will not see it! With organic matter in the form of manure, at command in immense quantities, and a soil capable of being improved by science, at least threefold, at small comparative expense, what is it which withholds Britain from her due place as an agricultural country? One thing alone,—the want of capital employed in the improvement and cultivation of the soil; and the disinclination of capitalists to invest or hazard money in what

has been, is, and, under the present system, must continue to be, a gambling, and therefore a losing, trade. Will it never be believed that, in a country so rich, so exhaustless in money resources as ours is, it is the first and only requisite to the prosperity of any attainable mode of industry, to make it stable—to deliver it from all conditions and causes of capricious variation—to place it on that free and independent footing from which it may bid defiance to all the world? We laugh at those who speak of the necessary inferiority of British agriculture. The simpletons think of the high wages of our labourers, but they never think of our immense resources in the way of applicable capital. The Hindoo, indeed, will scratch his master's field for twopence a-day, but out of that same field the work of an English labourer, aided by English methods, would bring thirty times the produce. And here is the mystery which our good frightened landlords cannot at all understand. They legislate in excessive terror of opponents like the harmless Hindoo; and to be preserved from the attacks of ogres so gentle and replete with humanity, that before them an insect is safe—they wisely cripple our capitalists, repulse the advances of capital, and ham-string ours and their real strength! How it will end is clear enough. Ignorance cannot prevail, although it chooses to call knowledge destructive. By and bye we will take up our friends per force—throw them into the long-boat—and, in good company, hurra for land!

### THE MALT TAX.

Sir,—It is not surprising that the malt tax should engross so much of the attention of the farmers, when they are the chief sufferers; on the contrary, I think they have been too patient, too slow, in their operations in petitioning parliament, too negligent of their own interests, by listening and attending to such arguments as those in your last paper by J. H. Y. The fact is, the farmers, farm labourers, and the productive classes are saddled sure enough at present with that obnoxious tax, the removal of which, without doubt, would be a great boon to them. Yet your correspondent would persuade the farmers to be still under the pressure, and for this reason, namely, that whatever parliament takes off one shoulder, they would assuredly put on the other. Now this is very comfortable doctrine indeed at the present moment, yet I think it will not have much weight, for the great body of the farmers are of a different opinion, well knowing that they have many influential and staunch friends in parliament, and it would be wrong to suppose they would vote against such proofs as will be brought before them of the great hardships and sufferings which they, the farmers, have endured for several years past, by easing them of one burden and putting on them another. No, I hope better things. If there be any shifting in that respect, surely those who ought to bear it will receive it; for instance, an increased duty on *wine, spirits, horses, dogs, carriages, foreign wool, tallow, rapeseed, linseed, cloverseed, &c.*; a tax upon *steam vessels and steam carriages* ought also in fairness to be levied. Now this is the kind of shifting I and many farmers would like to see carried into effect. Now let us see how the repeal of the malt tax would operate upon the barley grower. In the first place it would increase the consumption considerably, advance the price, consequently more land would be sown with that grain, and less with wheat, thereby causing an advance in that article also. A few years ago, when wheat sold well, and barley was low in

price, many sand farmers made a constant practice of sowing in the spring of each year a considerable quantity of land with wheat (I mean turnip land, which had been eaten off with sheep,) and which otherwise would have been sown with barley. I have introduced this for the purpose of shewing the clay farmers that the interest of both is blended. In answer to this it is said, "O yes, it is very true; it will advance the price by increasing the consumption, yet at the same time it will be the way to let in foreign barley at a low duty, thus overwhelming the home grower by the supplies, when the latter evil will be worse than the first." This I treat with indifference, for past experience has shown us there is no cause for alarm on that head, as the chief part of the foreign barley has hitherto not been fit for the maltster; and if the line of argument which has been assumed by your correspondent be good for any thing, will it not apply to wheat also? Tell the clay farmer that a scheme was in agitation which would take off a considerable quantity of wheat out of the market, and by that means cause an advance in price, would he not rejoice at the information, well knowing that the importation of foreign wheat would never much affect him, so long as he was receiving anything like a remunerating price for his own. Although the present corn laws are not quite what some farmers approve of, as respects the manner of striking the averages, yet upon the whole it must be allowed the sliding scale of duties acts so admirably that the home grower cannot for any length of time be injured by the influx of foreign corn. The legislature could not have formed them on a wiser plan; for while, on the one hand, they protect the farmer from foreign importation, when his corn is at low prices, so on the other hand it may be truly said they protect the consumer, when the home farmers' corn is at high prices.

A word or two for the farm labourers. Let any one visit the country villages, go into the barns, ask the labourers, with flails in their hands, at hard work, what the repeal of the malt tax would do for them? They would reply, "We should then get a little ale every day, but as it now is, we never taste any from week to week; our reduced wages in the winter months will not allow of it." And here with shame it may be said, an industrious, orderly, well-behaved and loyal body of men, are deprived of what they so much need by an intolerable tax. Remove it, then the labourer would be enabled to purchase half a bushel of malt at a time, for his wife to brew, and, at a fair calculation, this would be done at 2s 6d and would make above twenty quarts of ale, at 1½d per quart; allowing him a quart per day, the half bushel would give him nearly three weeks' consumption. This would empower him to do more work, earn more wages, and keep more at home, thus preventing his mind from being contaminated at that greatest of all nuisances—the beer-shop—where revel together the political agitator, the drunkard, the lewd and profligate, in short all the refuse amongst the lowest grades in society. This of itself is a sufficient reason for abolishing the tax. The insertion of these remarks in your valuable paper will greatly oblige, sir, your obedient servant,

AN OLD FARMER.

March 10, 1835.

LECTURE ON MALT LIQUOR.—(From a Correspondent.)—On Thursday evening, a public meeting was held in the Music-hall, Leeds, for the purpose of hearing a lecture from Mr. Joseph Livesey, of Preston, on Temperance, including an exposure

of the "Great Delusion" respecting the properties of malt liquor. Soon after seven o'clock, Mr. Bulmer, surgeon, was called to the chair. After a few remarks on the objects of the meeting, he stated that the members of the Leeds Temperance Society had not generally agreed to abstain from all intoxicating liquors, and that the declaration of the Society only required abstinence from ardent spirits, and moderation in the use of other intoxicating liquors, and that the Committee were in no way responsible for any statement Mr. Livesey might make. He then introduced that gentleman to the meeting. Mr. Livesey requested that a friend of his, Mr. John Thompson, of Halifax, might be permitted to address the meeting. Mr. T. said that he followed the laborious employment of a stuff dresser, that for upwards of three months he had abstained from all intoxicating liquors, and so great was the change in his system and feelings, that he felt as if he was placed in a new world. Mr. Livesey then commenced the delivery of his lecture, which occupied nearly two hours. He first observed that virtue, sobriety, and morality were of more importance to the stability and prosperity of a nation, than wealth, population, or intelligence. He then dwelt upon the causes of intemperance, amongst which he reckoned the influence of *interest, fashion, and ignorance* of the nature of intoxicating liquors. He stated that the nutrition in a gallon of ale would only be in proportion to the solid part of the barley dissolved in it; also, that not more five pennyworth of barley was used in the brewing of a gallon of ale, which is sold for two shillings; and that such was the loss sustained in the process of malting, brewing, and fermentation, that the nutriment contained in the ale was not more than a fifth part of the original cost of the barley. By the following division he showed how the two shillings paid for the gallon of ale were divided:—Barley costs 5d, maltster 1½d, government 3½d, brewer (including hops) 8d, and retailer 6d,—making 2s. Mr. L. also explained the process of malting, the object of which was to develop more saccharine matter;—that of brewing, the object of which was to draw off the saccharine contained in the malt:—and that of fermentation, by which the sweet matter is converted into spirit. After exhibiting the extract from a quart of ale, he stated that the average weight taken from a gallon was about ten ounces; that this extract was nutriment of a very poor description, and that ten ounces of fine wheaten flour, which could be purchased for one penny, contained as much nutriment as the ten ounces of extract from a gallon of ale. He then produced about three ounces of spirit taken from the same quart of ale, and burnt it upon a plate, to the surprise of the audience. He explained that this was the cause of the great delusion respecting the nutritious properties of malt liquor. Mistaking stimulation for strength, the people were deceived by the momentary excitement which malt liquor produced. He successfully met many popular objections respecting the excellency of home-brewed beer,—as to men getting fat with drinking ale,—as to the bad tendency of temperance people making a distinction between ardent spirits and other intoxicating liquors,—and as to the great danger of allowing the moderate use of any kind of alcoholic drinks in the present state of society. Mr. Livesey was most cordially and unanimously cheered during the lecture, and at the conclusion of it there was an enthusiastic applause. Mr. Anderton, of Preston, next addressed the audience in a most animated style for some time,

and about half-past ten thanks were given by acclamation to the chairman, and the meeting concluded. Twenty-six persons have signed the total abstinence pledge.

## THE PULQUE.

This *pulque* is the favourite beverage of the lower classes in the City of Mexico, and in a very considerable portion of the republic around; it is the produce of a plant called *Maguey*, or *Mettl*, or *Pittes*, a species of *Agave Americana*, or American Aloe. The growth of the plant is slow, but when it has reached maturity, its height varies from six to eight feet, with leaves of corresponding size; it will flourish with very little culture, on the poorest soil. In some parts of the country, there are regular plantations of this useful production; the plants are there arranged in lines, with an interval of about three yards between each. When the period of flowering arrives, the plant begins to be productive; it is on this account extremely important to the cultivator, to know exactly the time of efflorescence. The Mexicans learn its approach by certain signs which they attentively observe; they know almost the very hour in which the stem, or central shoot, which is destined to produce the flower, is about to appear, and they anticipate it by making a deep incision, and extracting the whole heart or bundle of central leaves (*el corazon*), leaving nothing but the thick outside rind, which forms a natural basin or wall, about two feet deep, and one and a half in diameter. Into this the sap, which would have gone to support the large shoot which has been cut off, is continually oozing in such quantities, that it is found necessary to remove it two or three times a day. This sap is allowed to ferment, and in a week or two it becomes *pulque* in the best state for drinking.

"The natives," says Mr. Ward, "ascribe to *pulque* as many good qualities as whiskey is said to possess in Scotland. They call it stomachic, a great promoter of digestion and sleep, and an excellent remedy in many diseases. It requires a knowledge of all these good qualities, to reconcile the stranger to that smell of sour milk, or slightly-tainted meat, by which the young *pulque*-drinker is usually disgusted; but if this can be surmounted, *pulque* will be found both a refreshing and a wholesome beverage, for its intoxicating qualities are very slight, and as it is drunk always in a state of fermentation, it possesses, even in the hottest weather, an agreeable coolness." The offensive smell in question is attributed to the dirty pig-skins in which it is conveyed from the place of culture to large towns. There is also a strong sort of brandy, called *Mexical*, or *aguardiente de Maguey*, prepared from this plant, and of this the consumption is great.

The cultivation of the maguey thus possesses considerable advantages. To use Humboldt's words, "a proprietor who plants from 30,000 to 40,000 maguey is sure to establish the fortune of his children." But it requires a degree of patience seldom found among the Indians of Mexico, to pursue a species of cultivation which only begins to grow lucrative at the end of fifteen years. In a good soil, the plant reaches the period of flowering in five years; in a poor one, no harvest can be expected in less than eighteen years. The plant is destroyed, if the incision be made too early,—that is to say, long before the flowers would have naturally developed themselves.

## ON THE MALT TAX.

Glamorganshire, March 31, 1835.

MR. EDITOR,—There are few recent instances in which the eloquence of a single speech has produced so great an effect on the opinions of the community, upon any public measure, as the speech of Sir Robert Peel, in the House of Commons, on the Marquis of Chandos' Motion for the repeal of the above tax. We now find many warm supporters of the agricultural interests, Whigs, as well as Tories, appealing to that speech to justify their abandonment of former convictions. The public press also, with few exceptions, are equally loud, either in eulogizing it, as proving the policy of the tax, or in impugning the motives of those who continue to adhere to their former opinions; and still believe that the agriculturists, and the labouring classes, have the strongest claims for its repeal. Being one of the former, whom the speech of the right hon. baronet, has failed to convince, and observing that you also remain firm to former convictions on the same point, I have taken the liberty of troubling you with the following observations on the subject. I have now before me a revised copy of that speech in a separate pamphlet, and much as I admire the ingenuity of its arrangement, and the ability displayed in it; yet, Sir, I trust I shall be able to prove that a great portion of its most important arguments rest on fallacious grounds.

Let me premise, Sir, that although I differ with the right hon. baronet on this question, yet I entertain a very high opinion of his splendid talents; and whether the malt tax is repealed or not, I consider his great knowledge and experience in the affairs of this nation eminently qualify him, with the guidance and assistance of a reformed Parliament, to occupy his present distinguished situation.

In the first place, I find that great stress is laid on the impropriety of bringing this question forward previous to the ministers' financial statement; also, because, "the noble marquis had called upon the house to exclude the consideration of every other interest." Does not his Majesty in his speech, I would ask, deplore the distress of the agriculturists; and trusts that the burdens which now unequally press upon them, will be lightened. In the same manner did the king's speech of last year deplore this distress, no reference being made in either of them to the distress of any other interest. Now, Sir, we all know the result of patiently waiting last year, for these financial statements, which was the repeal of the *house tax*. As I cannot for one moment doubt the sincerity of those speeches from the throne, and believing that the subjects referred to in them are intended for the consideration of parliament, the noble marquis must have been fully justified in taking this interest into consideration to the exclusion of others; and, if this tax ought to be repealed, the sooner it was determined upon the better, to afford the minister time for finding a substitute before his financial statement was framed.

But the main grounds upon which the worthy baronet appears to rest his case, are "the altered habits, and new tastes of the community," in now preferring tea and gin to beer, and refers with much confidence to the increased consumption of those articles. He then asserts that the removal of this tax would only afford an imaginary benefit to the farmer. In another part of his speech, he observes, "that we have no grounds to complain of the malt tax, for that the price of barley is

higher in proportion than any other grain, and for the last two or three years, has been gradually advancing,—why then," he asks, "disturb the tax? and what grounds have you for hoping that barley subject to the tax being very high, and wheat subject to no tax being very low, the removal of the tax on barley will ensure a rise in the price of it?" Indeed the triumphant manner in which the hon. baronet referred to this point, led me almost to expect that he would have concluded by proposing a duty of some hundred per cent. on wheat, with the view of advancing the price of this grain also to the grower.\*

I admit that the consumption of malt had greatly reduced in the last century, since the tax became so high; and for the past three years is again gradually increasing, but as the worthy baronet has carefully abstained from any reference to what I conceive to be the *real* cause of this change, I will endeavour to supply that deficiency. The habits and tastes of the lower classes, Sir, were changed by taxing that beverage, which had ever been the boast and favourite of Englishmen, near five hundred per cent., advancing the pot or quart of beer below 1½d., to 6d., and 7d.,\* which held forth such temptation to adulterate the article, that the community after being compelled for many years to drink the most noxious liquor, composed of deleterious drugs,† as a substitute for malt and hops, gave it up in disgust. This iniquitous system, and to the wants and necessities of the labouring poor the most cruel, was partially mitigated by the removal of the beer duties. Now mark the result, although the English labourer had been thus deprived for so long a period of his native and wholesome beverage, and had acquired a taste for tea and spirits; yet we find him, on the first opportunity returning gradually to his old beverage, which I contend is the real cause of the increased demand for barley ever since that tax was removed. It is true that hitherto he has only been permitted to get the article through the medium of those sinks of iniquity, the beer shops; but had the comforts and morals of himself and family been taken at all into the account, he would have been allowed to enjoy it with his meals at his own fire side, where only it would be to him a real blessing.

In the next place, I find the rates of duty imposed upon sundry articles of foreign production is given:—for instance, port and sherry eight-five per cent; coffee, sixty-three; tea, one hundred, &c. I grieve exceedingly, to see an article the staple produce of this country, the annual value of which to the consumer may be fairly estimated at twenty millions sterling, and yielding employment to upwards of one hundred thousand families, placed in juxta position as an object of taxation with the produce of foreign capital, and foreign labour. What, Sir, is the growth of our own fields, and the produce of our own taxed labourer not to

\* Allowing three bushels of malt to a barrel of beer, the cost, if free of duty, according to the present price of barley, would be as follows:—

3 bushels of malt at 3s. 9d. .... 11s. 3d.  
1½ lb. of hops, duty free ..... 1s. 0d.

Total cost of 36 galls., or about 1d per qt. 12s. 3d

† Annual imports of,

Corelus Indicus ..... 154,864 lbs.  
Gentian Roots ..... 175,000 lbs.  
Nux Vomica ..... 218,624 lbs.  
Quassia, ..... 140 tons.

have some preference in our own markets over the vineyards of Spain, and Portugal, and the tea gardens of China? Must we ever continue to bow the knee to the despots of those countries for leave to expend our millions sterling in the purchase of their commodities to supplant the skill and industry of our own husbandmen? The average rate of duty on the two latter articles, selected no doubt as the highest of those consumed by the lower orders, is eighty-one per cent., while the tax and restrictions on malt advance it upwards of one hundred per cent., and in beer shops where those orders can get it, it is much more. Sir R. Peel admits that prior to the taxing of this article, when the population was only six millions, there were six millions of barrels of beer consumed, and that at present there were only eight millions of barrels consumed with a population of upwards of fourteen millions; but the decrease in the quantity of malt made is now below half its former proportions. From the experience we have had of the removal of the beer duties, we have a right to calculate that if the tax and restrictions on making malt were removed, the consumption would shortly increase one-third, or 1,666,000 qrs., which at 30s. a quarter for the barley, would amount to two and a-half millions sterling. At the present price of corn, about two-fifths of its value is composed of labour, consequently there is now lost to the English labourer one million sterling annually, through the operation of this tax; while our poor-rates are heavily burdened with the maintenance of a good portion of them in idleness, or in transporting them to some distant part of the globe as emigrants. The new life and confidence which would be imparted to the drooping cultivators of our own soil, by an increased annual demand for their produce of two and a-half millions sterling, would soon be beneficially felt by other classes. But, says, Sir Robert Peel in his pamphlet, "it is only a matter of prophecy, and of course uncertainty, that any advantages will accrue to the agriculturists by repealing this tax." It is not prophecy, Sir, but fact, that since the beer duties were repealed, the consumption has increased more than it did in the previous one hundred years, and up to the 19th ult., appears to be at the rate of one million of quarters annually, which at 30s. a quarter, is a present benefit to the growers of one and a-half millions sterling for the barley. It is also a fact, admitted in this pamphlet, that the effect of lowering the duty on spirits last year in Ireland, has already increased the consumption 1,000,000 gallons, which forcibly confirms the prophecy that reducing the cost of an article of such universal necessity as beer, one half would greatly increase the consumption of it. Again, at page 30, the hon. baronet, states that the average consumption of beer on a farm of three hundred acres, is one hundred hogsheads annually, or one hundred and fifty barrels. The present cost at three bushels to the barrel is 24s. 9d., but if the duty on malt, and also on hops, were repealed, it would be only 12s. 3d., saving on each barrel, 12s. 6d., or 6s. an acre on the whole occupation. Now, Sir, I humbly conceive, that this also is not uncertainty, but deduced fairly from his own statements, and is a degree of relief to the farmers which is not to be sneered at in these times; yet, this is not all, for if the consumption, and consequently the growth of barley, increased one-third, the cultivation of other grain must diminish, which would shortly improve its price. On a mixed farm of three hundred acres of arable and pasture, one hundred would be under corn, and if it averaged

twenty-eight bushels per acre, an advance of 1s. a bushel would amount to 140% per annum. It is a very erroneous idea of the hon. gentleman, to suppose that any advantage arising from the removal of the tax would be confined long to only a small portion of our cultivators. The old adage, Sir, down corn, down horn, and vice versa, never fails to be verified, temporary derangements in the relative value of different kinds of agricultural produce frequently takes place from increased demand, or deficient crops of some grain, or severe losses of stock, but in a few years prices are again adjusted—witness the present reaction in the value of sheep. Shortly before the beer duties were removed, barley did not realise half the price of wheat, and an increased growth of the latter ensued. The practical experience of thirty years as an agriculturist, convinces me that within two years hence, unless the malt tax is repealed, barley would be reduced to its proper proportion to wheat, for I already observe numerous instances of land sown with barley instead of spring wheat. These proportions are, that the latter should be double the price of the former, barley would consequently be only 2s. 6d. a bushel at present. The removal of the beer duties has therefore advanced the price 1s. a bushel. The removal of this tax would also tend more than any other measure to bring back the farm servant under the roof of his master; and as to the supposed difficulty of labourers brewing at home, a daily allowance might easily be obtained from the employer according to the existing practice in cyder counties. Let the candid reader examine these facts, and I imagine he will acknowledge that it does not require the spirit of prophecy to foretell, that the agriculturist, and the working classes, would derive immediate and substantial benefits from the removal of the malt tax. I do not mean to contend, that it is the *only* cause of our distress, nor that the removal of it would be the *panacea* for all our difficulties. A great portion of the mischief, may, I believe, be traced to our monetary system; but this grievance is not confined exclusively to the agriculturist. Another cause is the facilities now afforded to Ireland to inundate us with her untaxed produce, and her starving population. But a revision of both these measures, although as absolutely necessary, would be slow in their operation for relieving the acknowledged distress, and the pressing demands of the poor occupiers for immediate relief.

With respect to the reduced quantity of malt made in 1816 and 1817, it may I believe be satisfactorily accounted for; in the first place, by the extreme misery experienced by the lower orders in those years for want of employment, but more especially by the wet harvest of 1816, which rendered at least one-half the barley crop totally unfit for malting, one of the worst harvests known in England during the last century, good malting barley advancing in value 100 per cent., increasing the price of malt considerably more than the reduction in duty. Again, in 1819, and 1820, the crops were above an average, excellent in quality, and low in price; and, as a natural consequence, an increased quantity of malt was made.

The total burden of this tax upon the community is next adverted to, which he makes out in the same plausible manner to be only a trifle beyond the duty paid. Now, instead of going to Mark-lane to find out the price of a choice sample of Chevalier barley, probably for seed, I will appeal to the experience of every grower of corn, and every maltster in this part of the kingdom, whe-

ther they have averaged more than 3s 8d for barley in the last two years, and if malt has not averaged in the same period 7s 8d to 8s? The real state of this account would consequently stand as follows:—

|                                                                                                             |             |
|-------------------------------------------------------------------------------------------------------------|-------------|
| 5,000,000 qrs of malt, at 64s . . .                                                                         | 16,000,000  |
| Increased price of beer at the ale and beer-shops, from 1½d to 5d a pot, the effect of the malt tax . . . } | 1,500,000   |
|                                                                                                             | £17,500,000 |
| 5,000,000 qrs of malt free of duty, at 30s . . . . . }                                                      | 7,500,000   |
| Total impost upon the community . .                                                                         | £10,000,000 |

—which is chiefly paid by the labouring classes for what I contend to be an article of necessity. Who that is possessed of the common feelings of nature, will deny the necessity of some nourishing beverage, to allay the thirst of those whose hard lot it is to toil from morn to night, or from sun-set to sun-rise in the mines and iron-works in this county, generally in a temperature of 120° or upwards? Or show me the man who has no pity for the poor peasant, exposed to the scorching rays of a summer's sun, while exerting his whole strength for 14 or 15 hours a day in cutting down the produce of our fields, and is compelled by this cruel tax to quench his thirst in the adjoining ditch, which it is my lot continually to witness. Even in the absence of any other motive, let the odium be what it may, I shall on these grounds alone continue to advocate the repeal of the Malt Tax.

The ingenuity of the honourable baronet is next displayed in attempting to make it appear that this Malt Tax with all its bonds, duties, penalties, restrictions, &c., is the most salutary and efficacious method that can possibly be devised for keeping the trade free. That the removal of these restrictions, and the reduction in the value of malt, from 64s to 30s, would afford such positive advantages to the great capitalist that we should see no more of small maltsters with limited means, but that the growers of barley would then be entirely at the mercy of the former, for he states that at present “there is 3,000,000l. of the public money applied as so much additional capital in the purchase of barley.” Who ever heard of a maltster getting money from the treasury to buy barley? It is true that the payment of the duty is not required at the time of making the malt, provided ample security by bonds is given, and a few weeks credit is thus obtained, but nothing else. As the right honourable baronet claims so much credit to the Government for their liberality to the maltster on this head, let us compare it with that shown to the importer of any foreign commodity. In the latter case the article is allowed to remain in warehouse for any length of time, and is regularly bought and sold in the market before the duty is demanded, which is not done until the article is taken out for consumption. The maltster, on the contrary, when the sitting day arrives, has no mercy shown him, and whether he has been able to dispose of a single bushel of his malt or not, the duty *must* be paid.

I must now come to the general summing up of the honourable gentleman, which he does in the most pathetic strain, and in the language of the most serious alarmist, such as—“Shall we maintain the public honour,—the disgraceful course of

a deficient revenue,—the suspension of payments,—breach of the national engagements,” and that “those who reject his advice must be responsible for all the consequences of so rash and unwise a decision, &c.” and that great *bug-bear*, the bare mention of which, even to a *Reformed Parliament*, produces such gloomy reflections and such consternation even amongst the most refractory members, that in the hands of a skilful minister it is found to be a dreadful weapon, and on several former discussions on the impolicy of the Malt Tax, when the measure had been carried by sound reasoning, no sooner were the words “*Property Tax*” mentioned, than the hustings-repealers of this Tax immediately viewed the matter in a different light. In his ironical manner, he “congratulates you gentlemen of the landed interest on finding yourselves relieved from the pressure of the Malt Tax, and falling upon a good comfortable *Property Tax*.” As one of that body, Sir, who would be affected in some little degree should that prospect be realized, I would cheerfully accept his congratulations, being fully persuaded that a *Property Tax* would be a far more just tax towards the landed interest than this Malt Tax, for the injurious effects of the latter are almost exclusively felt by them; and its removal would, according to the foregoing calculations, release the land from a heavy and most unfair pressure, to the amount of 8 or 10s an acre on all farms of the description before mentioned, which would be an immediate benefit to the tenants, and on general principles must be a deduction from rent. Whereas a *Property Tax* of, say 5 per cent., which would yield a much larger revenue than is now derived from malt, would not affect the land 1s an acre; and would fall equally on all property;—on houses, public buildings, manufactories, mines, collieries, tithes, funded property, canals, railroads, docks, tolls, shipping, &c., &c., which are affected only in a very slight degree by the duty on malt. If “the gentlemen of the landed interest” could be brought to view this subject in its proper light, they would not hesitate one moment in deciding in favour of a *Property Tax*.

The pressure of direct and indirect taxation on the industrious classes, though nominally to an infinitely greater amount, was comparatively unknown during the operation of the Bank Restriction Act. But now, with a metallic currency, and the low prices which necessarily accompany it, it is become intolerable. Our present system of indirect taxation enters so largely into the cost of production as to be highly prejudicial to the British manufacturer for the foreign market. It is generally admitted, that at least one-fourth part of the wages of labour is absorbed by taxation, every article the produce of labour must therefore be enhanced in value in that proportion; thus every manufacturer or farmer paying 1,000l. a-year to his workmen, pays 750l. for labour, and 250l. for his mens' taxes. Indirect taxation pauperizes a large portion of the community by enhancing the value of those articles they are most in need of, and again by fettering their employers deprives them of employment. Parochial burdens and the charges of tradesmen and mechanics are all enhanced a third or fourth by the same means. Out of the eight millions Poor-rates, at least two millions of it goes to Government. From the effects of this system of taxation we find a large portion of our aristocracy escape altogether by residing in foreign countries. Two-thirds of our present taxes are required to discharge the interest of the debt, which was chiefly contracted

during the war to protect the *property* not the industry of the country, certainly not the industry of the present day, which then had no existence. It is therefore only just that a portion of this burden should be directly levied on the former. Let skill, industry, and labour, be released from the trammels of taxation, and they would soon enhance the value of property beyond the amount of a moderate tax on it. The raw produce of the earth, whether the soil on the surface, or the mineral beneath, is of little worth to the owner without the application of the skill, capital, and labour of the productive classes, and the imposition of taxes on the latter in an undue proportion, while at the same time a collateral measure is secretly but steadily reducing the market price of their produce, will in the first place effect their destruction, and in the next reduce the property of the former to a very low value.—I am, Sir, yours, &c., CYMRO.

### ZEKIEL HOMESPUN'S SONG.

AT THE PLOUGHING MATCH, WHICH TOOK PLACE AT NEWTON, MARCH 12, 1835; WRITTEN AND SUNG BY THEIR POET LAUREATE, IN THE CHARACTER OF A PLOUGHMAN.

Feather Adam, when turned off his land,  
To earn bread by the sweat of his brow,  
It is thought there were put in his hand  
Some materials to mack him a plough.  
From that time to this its been used,  
Or the world had been thistles, folk say;  
But no labour sure ever amused  
Like the ploughs we have witness'd this day.  
Tol de rol, &c.

All mankind have a plough of their own,  
Tho' strictly not class'd as *ploughmen*;  
The sculptor's sharp plough moulds the stone,  
While the lawyer ploughs deep with his pen;  
The ploughman's a state plough in motion,  
Which turns up fresh thoughts to convince;  
And Lord Nelson so well plough'd the ocean,  
It's ne'er bourn a haughty foe since.  
Tol de rol.

Great Napoleon ploughed hard with his sword,  
And ne'er let the poor Continent thrive,  
Not a king durst oppose his proud word,  
Till we sent him some lads that could drive;  
In their match they found plenty to do,  
For three days they tried all their skill;  
It wor work'd on the plains—Waterloo,  
And Lord Wellington tought 'em to drill.  
Tol de rol.

Our king tried of late through each borough,  
With prerogative's plough in his hand,  
To turn up a political furrow,  
And see what lay dormant i' the land;  
But if all the world tells us not stories,  
The wind scatter'd seed fro' his fist,  
For in soaring up Whigs with the Tories,  
Its thought that some Tories have mist.  
Tol de rol.

Chandos has a plough rather shallow,  
And he's plough'd up St. Stephen's with care,  
For he ne'er let those Manners be fallow,  
While his feather still sack'd the best share;  
But his conscience—I'd not wish to shock it,  
For surely he's choking with sense,  
To wedge all the rents fast in his pocket,  
And relieve us at the nation's expense.  
Tol de rol.

He has said "He'll ne'er rest in his place,  
Till they've ta'en all the duty off malt."\*  
If fresh water should fill ocean's space  
Would it change with a handful of salt?  
If he said "He'd ne'er sleep in his bed  
Till he'd made the landowners consent  
To mack tenants rejoice in cheap bread,  
By reducing one-half of their rent."  
Tol de rol.

But if landlords are deaf to our trouble,  
And for sufferings like our's cease to think,  
Let's abjure both Chandos and his bubble,  
Nor besot our ideas with cheap drink.  
In the Indies their work they disown,  
So when the worst comes, to the worst we'll go  
snacks,  
We mun learn how the shugar cane' grown,  
And exchange our condition with the blacks.  
Tol de rol.

But let's banish all thoughts of our sorrow,  
And rejoice with those lads—won the purse,—  
Mayhap things may change by to-morrow,  
And we all know they ne'er can get worse.  
Let's drink to our friends and each neighbour,  
In friendship and love pledge the vow,—  
May crops cheer the poor farmer's labour,  
And God speed the husbandman's plough.  
Tol de rol.

HITCH'S PATENT BRICKS.—We have lately had an opportunity of examining with some attention these most ingenious and admirable bricks, invented by Mr. Hitch, of Ware, and feel surprised that they should be so little known in the metropolis, or, if known, so little used. These bricks, which are of large size, are so formed that each dovetails into the other, offering a bold and uniform face, but presenting in the interior a system of cavities, which are made to communicate throughout the whole extent of the wall by means of dowel holes through the bricks; into these cavities, as the work proceeds, a concrete of lime and clean gravel is introduced, which renders the whole, when set, a complete rock, immovable unless broken piece by piece, and this, in consequence of less labour being required on account of their size, and the difference in price between concrete and brickwork, is done astonishingly cheaper than by the common method. These bricks, it appears to us, might be used with the greatest advantage for docks and embankments where great strength is required, and in these, from the thickness of the walls, the saving would, of course be still greater. In the walls of green-houses, we think the interstices might be left open for the circulation of hot air, and in the thicker walls of dwelling-houses, the flues might be constructed with some advantage. The only difficulty in the way of their general introduction appears to be that which would result from the ignorance of the workmen, the bricks being of many shapes; this, however, a little practice would of course obviate.

In the flock of Mrs. Millward, at the "Fish pond farm," near Hastings, the following extraordinary number of lambs have been produced this season, five ewes yielded one each; 290 had twins; while the remaining five produced each three at a birth; making in all 600 lambs from 300 ewes: an instance of fecundity unparalleled.

\* Vide—His Lordship's speech to the Buck's electors.

## PENSIONS GRANTED BY BRITISH MINISTERS.

The following document was laid on the table of the House of Commons in the early part of 1832:—

| Premiers.   | No. of years in office. | No of Pensions granted. | Amount per annum. |
|-------------|-------------------------|-------------------------|-------------------|
| Lord North  | in 11 ..                | 16 ..                   | £ 1,932 18 2      |
| Pitt.....   | — 17 ..                 | 164 ..                  | 21,816 15 11      |
| Addington.. | — 3 ..                  | 37 ..                   | 3,349 12 0        |
| Grenville.. | — 1 ..                  | 32 ..                   | 4,912 12 8        |
| Perceval .. | — 2 ..                  | 28 ..                   | 3,357 14 6        |
| Liverpool.. | — 15 ..                 | 376 ..                  | 40,869 11 6       |
| Canning ..  | — ..                    | 3 ..                    | 298 6 10          |
| Goderich..  | — 3 ..                  | 14 ..                   | 2,979 7 10        |
| Wellington  | — 2 ..                  | 50 ..                   | 10,717 13 9       |

It appears that the Duke of Wellington, in two years found thrice as many objects deserving Royal bounty and public reward as Lord North found in eleven years; being in the ratio of about sixteen to one!

## THE PRESENT STATE OF AGRICULTURE, AND OF THE INTERESTS DEPENDING UPON IT.

(From the Metropolitan.)

In our former number we endeavoured to point out, that as the price of labour would always depend upon the price of bread, the lower classes would not be benefited by low prices; that, on the contrary, they would suffer, as low prices were invariably attended with distress and want of employment. We followed up our argument, by pointing out that, in sacrificing the agricultural to the manufacturing interest, we were destroying the property, the competence, and the happiness of the many, to the supposed advantages of the few;—a system of misrule which must prove fatal, as the great duty of a government is to provide employment for labour, which is the real wealth of the country. We shall now continue our arguments, and our first object shall be to prove that low prices have always produced misery, not only to the agricultural labourers, but also to the manufacturing population.

In so doing, we shall avail ourselves of the remarks of Messrs. Milne and Bain. From the first, who was opposed to the agricultural interests, we have nevertheless this calculation in his Treatise on Annuities, in which the average rate of mortality of each year is ascertained, with the price of wheat. It is only by these means that we can obtain any estimate upon this point. It is evident, that as people are in full employment, and consequently not suffering from distress, so will the mortality be less; whereas if, on the contrary, they are out of employment, and subject to privation and misery, the mortality among them will be greater.

| Price of Wheat per Quarter. | Average rate of Mortality |    |         |
|-----------------------------|---------------------------|----|---------|
| Under 40s.                  | ..                        | .. | 1 in 37 |
| 40 to 50                    | ..                        | .. | 1 .. 39 |
| 50 .. 60                    | ..                        | .. | 1 .. 41 |
| 60 .. 70                    | ..                        | .. | 1 .. 46 |
| 70 .. 80                    | ..                        | .. | 1 .. 43 |
| 80 .. 90                    | ..                        | .. | 1 .. 50 |
| 90 .. 100                   | ..                        | .. | 1 .. 50 |
| Above .. 100                | ..                        | .. | 1 .. 43 |

This statement, from an opponent, affords pretty fair evidence of the unfavourable effect of low prices. The mortality decreases until corn rises above one hundred shillings per quarter, when scarcity has the same effect as want of employment.

But Mr. Bain has taken much more pains in his calculations, and commences them with this most judicious observation:—

“Believing the prosperity of the landed proprietor, the merchant, the manufacturer, and the labourer, to be intimately connected, a system of policy, which seeks to enrich any one of these classes at the expense of the rest, is likely to terminate in the impoverishment of them all.”

First, let us lay before the reader the result of his first enquiry.

*Burials of each Million of Population, on an Average of the Forty-one Years, 1780 to 1820.*

| Bullion Price of Wheat per Quarter. | Burials in seven Manufacturing Counties. | Burials in ten Agricultural Counties. | Difference in favour of Manufacturing Counties. | Difference in favour of Agricultural Counties. |
|-------------------------------------|------------------------------------------|---------------------------------------|-------------------------------------------------|------------------------------------------------|
| Under 40s.                          | 21,430                                   | 25,165                                | 3,735                                           |                                                |
| 40 to 50                            | 22,364                                   | 23,112                                | 740                                             |                                                |
| 50 .. 60                            | 21,030                                   | 21,181                                | ....                                            | 177                                            |
| 60 .. 70                            | 20,358                                   | 19,700                                | ....                                            | 330                                            |
| 70 .. 80                            | 19,502                                   | 18,925                                | ....                                            | 577                                            |
| 80 .. 90                            | 19,873                                   | 17,550                                | ....                                            | 2,323                                          |
| 90 .. 100                           | 19,206                                   | 17,417                                | ....                                            | 1,789                                          |
| Above 100                           | 23,780                                   | 20,480                                | ....                                            | 3,300                                          |

It is evident, by this table, that low prices affect both the agricultural and manufacturing poor, but the agricultural by far the most; until the prices advance, when the agricultural labourers suffer the least. Still the suffering of the manufacturing classes is considerable, as will be seen by the second column in the table, in which the loss of population, when the wheat was at ninety to one hundred shillings, is only 19,206 in the million; when, with the wheat as low as forty to fifty shillings, the loss amounted to 22,364. That low prices are not so injurious to the manufacturing as to the agricultural classes, is certain; but it is no less certain that they are injurious, as we shall show by the following table, in which the average mortality of seven manufacturing counties is calculated.

| Bullion Price of Wheat per Quarter. | Burials in each Million of Manufacturing Population. |    |        |
|-------------------------------------|------------------------------------------------------|----|--------|
| 1793 to 1820.                       | 1793 to 1820.                                        |    |        |
| Under 50s.                          | ..                                                   | .. | 21,860 |
| 50 to 60                            | ..                                                   | .. | 20,618 |
| 60 .. 70                            | ..                                                   | .. | 20,030 |
| 70 .. 80                            | ..                                                   | .. | 19,502 |
| 80 .. 90                            | ..                                                   | .. | 19,873 |
| 90 .. 100                           | ..                                                   | .. | 19,206 |
| Above .. 100                        | ..                                                   | .. | 23,780 |

It will be observed, in each of the three tables we have given, that immediately the price of wheat rises to a height to prevent the poor from obtaining the needful supply, the mortality again increases. The medium appears to be the most salutary—very low prices necessarily being attended with want of employment, which occasions the same distress and subsequent mortality as the scarcity arising from the prices becoming so high, that bread is not attainable by the poorer classes.

We will now give one more table from a work of great research, (Pebrer on the Capital and Resources of the British Empire,) as it will more fully prove the truth of our observations as to the immense importance of agriculture to this country, and the capital which is staked on it, compared with that employed in the manufactures, consumed at home as well as exported.

**ESTIMATE of the Value of PRODUCE and PROPERTY annually raised and created in GREAT BRITAIN and IRELAND, by the Combination of Capital with all animate and inanimate Power.**

| <i>Agriculture.</i>                                                                               |             | £         | £           |
|---------------------------------------------------------------------------------------------------|-------------|-----------|-------------|
| Grain of all sorts - - -                                                                          | 86,700,000  |           |             |
| Hay, Grass, Field Turnips, Vetches, &c. - - -                                                     | 113,000,000 |           |             |
| Potatoes - - - - -                                                                                | 19,000,000  |           |             |

Now the first argument we shall attempt to prove is—That the price of corn in this country is not raised by the landlords or farmers, but by the government, who have laid such onerous taxes upon this necessary of life.

The second is—That in destroying the agriculturist, we are destroying the consumer, and injuring the manufacturer as well as the agriculturist.

The third—That the state of the agriculturist is at present as bad as it can be, and that the corn laws are already virtually repealed.

1st. That it is the onerous taxation which has raised the price of corn.

Let it be remembered, that of *all* other taxes the agriculturists pay their equal share with the rest of the community, and taking them in their ratio to the rest of the population, of about sixty-three to one hundred and sixty-five,

|                                                                              | £           |
|------------------------------------------------------------------------------|-------------|
| Their proportion of the sum annually raised of fifty-four millions will be.. | 20,600,000  |
| To which we have to add the Land Tax not yet redeemed .. .. .                | 1,160,000   |
| The Malt Tax .. .. .                                                         | 4,359,333   |
| Hops .. .. .                                                                 | 150,000     |
|                                                                              | £26,269,333 |

Such are the taxes which press upon the agricultural interest; but if these were all, they might be borne, although they amount to one-half the taxation of the British empire; but these are not all, we have some enormous items still to add. In the first place, we have the poor-rates, the proportion of which paid by the agriculturists cannot, at the lowest, be estimated at less than six million pounds; and then we have other charges equally onerous and oppressive, which are, generally speaking, lost sight of by those who are not landholders. We refer to the county and highway rates. Every one knows the expense of law and justice, and of road-making in or near a metropolis. Let them then reflect what it must be to pay all the expenses of these important objects throughout the whole empire.

What is it then that has raised the price of bread in this country above that of others? In every other article of manufacture we can beat down all competition, and so we could in bread, if we were allowed to compete fairly; but all this taxation, excellent and superior as our farming is, renders it impossible. It is taxation, unjust and unequal taxation, which has raised the price of agricultural produce in this country, and has so paralyzed its energies.

Our second argument is, that in destroying the agriculturist, we are destroying the consumer, and

injuring the manufacturer, as well as the agriculturist; or in fewer words, we are ruining the nation.

The great error of the political economists and advocates for free trade is, that they consider the prosperity of a nation to depend upon its exports and imports alone; or if not wholly depending upon them, that they are paramount to all other considerations. Hear their arguments—

“It costs a year's labour of three men to raise a given quantity of corn, on our inferior soils, whereas we might purchase an equal quantity of foreign corn for manufactured goods, with the labour of two men: thus one-third of the cost might be saved.”

Now if we had to procure the three men from another country to till this inferior land, it would perhaps be preferable to hire two manufacturers instead, but such is not the case. We have the men, and if we do not find employment for them, they must be supported without labour. Moreover, in the case of manufacturers, we purchase the raw material; in the case of agriculture, we produce it. Yet this is called argument!!!

Agriculture is a manufacture, and the most profitable of all manufactures to the state. Every grain raised beyond the seed sown adds the whole extent of its produce to the wealth, and the whole of the people employed in the production of it, to the strength, of the state. Its profits are certain, its employment is healthy, and it is almost independent of machinery.

The great object of every state, the *ne plus ultra* of good government, is to afford employment for the industry of the inhabitants; and the first point to be attended to in finding that employment, is in manufacturing the raw material produced by the country, for this is real wealth. Agriculture, therefore, must always prove the most beneficial manufacture (for a manufacture it is) to every state. The fruits and productions of the country are raised by labour and capital, are disseminated and divided among every class and condition, who in return exchange their labour for the labour of the agriculturist, until sustenance is obtained by all. It is this internal commerce which is so beneficial, and so important from the rapidity of the exchange, and the stability of it, as far as the produce of every description is consumed by those who inhabit the country.

We have already observed that the rents formerly expended in the country have decreased about seventeen millions; but we have, in this instance, only referred to the landlords, not the majority of those employed in agriculture, amounting to eight hundred thousand families in Great Britain alone, whose wages, in good times, amounted to twenty-five millions annually, and which are now reduced to one-half. Do the manufacturers, the shopkeepers, and every other branch of the community, lose nothing by the twelve millions less expended in the productions and manufactures of the country? This is a rough calculation we grant, but still it cannot be far wrong; and when we add this to the other seventeen millions before-mentioned, it will make an aggregate of nearly thirty millions less expended in the home consumption of the country, which deficiency, we conceive, it will be difficult to make up by any return arising from our foreign trade.

It is not true then, that, by oppressing the agricultural interest, we are injuring the manufac-

turer and the state at large. To strengthen our arguments, let us lay before the reader the amount of capital employed in agriculture. Pebrer states—

“That £1,901,900,000, or more than one half of the whole British capital in the United Kingdom, is employed or vested in agriculture.”

The last argument we have to prove is, that the state of our agriculturists is as bad as it can be, and that the corn laws have virtually been repealed. What do the advocates for free trade assert?

“We might purchase a regular supply of corn from abroad, at about forty shillings per quarter, whereas, our present system of corn laws compel us to raise the same supply from our inferior soils at the expense of sixty shillings per quarter, or more; thus are we losers of twenty shillings per quarter on our whole annual consumption.”

First, let us observe how carefully these gentlemen talk of inferior soils as being the cause of the high price of corn. Our soil is not inferior, and our skill in husbandry is superior to every other nation; but it is taxes and rates upon the price of bread which obliges the farmer to ask a remunerating price. They know all this, but they also know how very popular the outcry is against the landowners. They would ruin them to serve their own purposes. Unfortunately, as we stated before, they would, in their short-sightedness, destroy the goose which lays the golden egg; and in that attempt would they involve all in one general destruction.

But what is the real fact at this present moment? These political economists tell us that they might import corn at forty shillings per quarter. Why, they have the desideratum; for corn now in England has been at forty shillings per quarter, or little more, during this winter, and that without the repeal of the corn laws.

How is it then that their wishes have been fulfilled? If it were not for the corn laws, such would be the case they have asserted in their radical spoutings. But it is now the case, and the corn laws still remain in full force. The causes are these:—First, from a very good harvest in England and Scotland;—second, from a very large importation from Ireland, which increases every year, and will very soon do away with the necessity of abrogating the corn laws;—and, thirdly, by a side-wind manœuvre of Mr. P. Thompson's, which virtually repealed the corn laws. He decreed that all corn coming from the Canadas, Ireland, Guernsey, Jersey, Alderney, and the Isle of Man, should come in upon simple declaration. Now any one who knows how little oaths are regarded at the custom-house, may imagine how very little effect a declaration must have. The consequence has been, that Russian and Prussian wheat have been admitted, *ad libitum*, upon a simple declaration that it was of colonial growth. Thus have the corn laws been evaded, and Mr. Thompson has proved, not only in encouraging drunkenness, but also in encouraging falsehood, that morality is no part or parcel of the new light in political economy.

One more remark here. It appears that the price of corn in England is now as low as it can be if imported from the continent. We have already shown what a load of taxation there is upon this

necessary of life grown in England. Can there then be any longer any doubt of the injustice shown to the English agriculturist, or the extreme state of distress to which he is now reduced?

Now although, for a short time, a supply of corn may be received from the continent, either surreptitiously as at present, or allowing the corn laws to be repealed, the question is, would that supply continue at the same price? We reply, most certainly not. The very moment that the supply to this country was felt by the country supplying, the price would be raised. At present, each country raises the corn for which she can procure a market, and no more. It is true, that if the ports were open, that they would raise more; but that requires some little time, and after all, would be to them an uncertain speculation, as it would be a *manufacture* depending upon a foreign market, which might be closed to them. A small supply might be sent in at forty shillings, but any considerable demand would immediately raise the price.

We will now proceed to examine what consequences may be expected, if the corn laws are repealed; or, what is the same thing, if the agricultural interest is to remain in its present depressed state.

To answer this in a few words, we should say, it must end in *national bankruptcy*, even if every other vital interest of the nation were regarded; but when we consider how these political madmen have struck the same blow on our shipping interests—how our West India colonies have been sacrificed—how indeed, we may say, every rampart of national prosperity, so carefully guarded by our fore-fathers, has been thrown down by these enemies to their country—we can only hold up our hands in amazement at finding “such things are,” and bitterly curse the folly and vanity which would, before this, have annihilated any country not possessing the enormous resources and capital of Great Britain. But to proceed.

At present, the price of corn is but sufficient to pay the bare expenses of agriculture; for this last year rents have either not been paid at all, or have been paid out of the savings of former years. Oppressed as the land is by the imposts of government, it can no longer be tilled, and can no longer afford that employment for the industry of the country, which is so beneficial to the state. The consequence has been, that thousands of acres have every year, for some time past, been laid down as pasture; and the consequence will be, that thousands and tens of thousands more will, to avoid the expense of tillage, be laid down as fast as possible.

Pasture indicates a country in a poor and primitive state; the capital and the labour required for pasture land is little or nothing compared to that in tillage. Every acre, therefore, thrown down into pasture, takes away from the wealth of the state and the employment of the poor. A clever writer has lately observed, that “every million of acres thrown out of cultivation *foregoes* a sure and direct profit to the state of five to eight millions annually. Now we will take the lowest calculation of five millions, and allow that land in pasture is equal to half the value of land in tillage, which it is not. If then ten millions of acres are laid down in pasture out of the forty-seven millions of acres cultivated in this country, there will be a positive loss to the state of twenty-five millions annually, a sum which it will require the export of many manufactures to reproduce.

|                                                                                                                           |             |
|---------------------------------------------------------------------------------------------------------------------------|-------------|
| The total value of woollen goods exported, of which manufacture many of the dye-stuffs are foreign, does not exceed ..... | £ 5,000,000 |
| Silk goods, of which the staple and many of the dyes are foreign, are not valued at .....                                 | 300,000     |
| Linen, of which the flax is foreign, about.....                                                                           | 2,000,000   |
| Cotton goods and yarns, from which we must deduct seven millions at least for cotton, dye-stuffs, &c. ....                | 17,000,000  |

Let these facts be carefully weighed, and then the true value of agriculture, employment, and home consumption, will be seen by every unprejudiced person.

We must never forget that the industry of a country is its wealth, and that in proportion as that industry is unemployed, so will the country become impoverished. Commerce adds to the wealth of a country by affording a profitable exchange of the fruits of industry, and in the same way the manufactories are important even when we work the raw material of another country, as it affords employment and subsistence, as well as returns wealth or profitable exchange; but of all commerce, that raising from home produce, exchanged for home manufacture, is the most valuable, as a country can exist by the latter, which is stable and certain, but cannot depend upon the uncertainty of the former. Internal commerce, or home consumption, is also the most valuable of all commerce, from the rapidity of the exchange. The great axiom of political economy is to legislate equally for the industry of all classes, to provide ample employment for that industry, the overflows of which will, by foreign exchange, add to her riches after that the cup, filled to the brim at home, has secured competence and content.

Every fraction of labour we part with, is parting with so much wealth, for it throws so much capital out of employment, and in proportion must all classes suffer. In farming there is a constant demand for wood, for iron; assistance is required of the rope-maker, of his hemp, of the saddler, the mason, the plaisterer, the brick and tile-maker, the brewer, the baker, miller, flax-dresser, soap and candle maker, woolcomber, weaver, clothier, hatter, and hosier; the money raised by produce is circulated in the purchase of manufactures to an enormous extent, the shopkeeper thrives, or is bankrupt, as the farmer thrives, or is ruined. There is not one class of people who are not directly or indirectly interested in the well-doing of the agriculturists; in fact, wealth and strength, the existence and happiness of the state, depend upon its agricultural prosperity. We trust, that in the many pages which we have written, that we have succeeded in proving that the agricultural interest has had but foul pay—that it has been oppressed and unfairly burdened—that every tax laid upon the agriculturist, is, in fact, a tax laid upon the price of bread. We have repeated again and again, that the price of labour will depend upon the price of bread. and that the only boon which can be given to the artisan or agricultural labourer, is full employment for his industry. We have also argued, and we trust proved, that home agriculture and home consumption are of more importance to every state, than foreign trade, and that the health and strength of the state depend upon it. We have now to inquire what measures should be taken to relieve the agricultural inter-

rest, which has not only been neglected, but cruelly oppressed, by an interested and miscalculating theoretical government.

We have shown that one great cause of agricultural distress was the alteration in the currency, created by Mr. Peel's bill, and it may be inquired whether we think it advisable to return again to an artificial state. In reply, we say we do not wish that money should return to the same depreciation as it was before that bill was passed; yet, at the same time, we think that a more unlimited currency would go far to relieve the nation, now that it has to provide fifty-six millions per annum for the annual expences. It is in the point of taxation that an artificial currency so much assists every portion of the community; and to prove that we will assume a case. A tradesman in an artificial currency receives nominally one thousand pounds per annum in the course of business, and expends in the same proportion. In cash payment he receives five hundred pounds per annum, and expends in proportion. So far he is not affected by the return to cash payments, as selling dear, he buys dear, and selling cheap, he purchases cheap; but the government demands from each individual a certain proportion of his means for the expences of the nation. Now it is quite indifferent to government whether that demand is paid to them in artificial or real money, as they pay it away under the same circumstances. Assuming, therefore, that the government requires one hundred pounds in direct and indirect taxes from this individual, in the artificial currency he would pay one hundred pounds out of one thousand, whereas, in the real currency, he pays one hundred pounds out of five hundred: in one case paying ten per cent., in the other twenty per cent. We have here assumed numbers, merely to make the illustration clear. We have no intention of asserting that the return to cash payments made any such difference, or that the taxation is what we have brought forward. We only show that an artificial currency enables the nation to meet the burthen of taxation much more easily than when it is paid in cash.

This would certainly afford some relief, but if the agriculturists expect that they will ever be placed (unless in case of war) in the same position that they formerly were, they are mistaken. It would be injurious to the state, and ultimately prove injurious to themselves, for there can be no stable prosperity when any one interest is supported to the prejudice of the others. They require relief, and have a right to it, but that relief cannot be of the magnitude which many would anticipate, or claim as their right.

We always were of opinion that the removal of the malt tax would not afford that relief which has been anticipated; and after the admirable and argumentative speech of Sir Robert Peel on the subject, we consider that the question is for ever set at rest in the opinion of unprejudiced men. We must, therefore, offer an opinion as to what other measures may be resorted to, to relieve the agricultural interest.

In the first place, we consider that the removal of the duty on hops would be very advantageous. At present the price of hops is so enormous, that but a small portion is used in brewing—drugs of different sorts being substituted. Now this is wrong, as foreign is employed to the injury of home produce; and we really believe, that if hops were allowed to be grown in every garden, that there would be a great increase in the consumption

of beer, to say nothing of its being made a much more wholesome beverage. Here the agriculturist would be benefited and the country lose nothing, in all probability, as the increased consumption of malt would more than compensate for the present duty on hops, not amounting to more than four hundred thousand pounds.

The second remedy to which we will allude is one, perhaps, which will not be so readily acknowledged as advisable, but still it is no more than justice. The only property which can be laid hold of, is the *soil* and the *funded property*. The former, we have shown, bears more than its share of the general burden, and must be relieved; the second *pays no portion whatever*. This is unjust, and we consider that a tax on the funds (after we have paid off the three and a half per cents.) is advisable; other taxes, which bear upon the whole community, and chiefly on the agricultural interest, being remitted equal to the tax imposed.

If this were acted upon, the landowners would in another way be much relieved. Mortgages would then be obtained at a much lower rate of interest than at present, for the funded property being taxed, and the money lent on mortgage not taxed, it is clear that there would be a great premium upon the latter.

We believe that we have now mentioned all that can be done at present for the relief of the agriculturists, keeping in mind the good old maxim of carrying the dish even. Much cannot be done, but something must, and that speedily.

THE AUCTIONEER.—There is no man who spends so much breath, who talks so fast, and is so lavish of words, as the auctioneer. He repeats the same thing over and over again, and never grudges his labour. He is fond of smart sayings and sudden turns of the sense, and he is witty, at the expense of his goods or at the expense of his customers. He can talk of several different things at once and without confusion. But he sometimes very ludicrously mixes up different subjects in the same sentence. For instance, lately dropping in at a book-auction, there happened to be a man who annoyed the company and the auctioneer with a segar. The book had gone up to twenty-seven cents and a half, and the auctioneer dwelling upon it cried, "And a half, and a half,"—when smelling the annoyance, he shouted out, "Curse your segar!—and a half, and a half, twenty-seven and a half,—thirty—thirty-two and a half, and a half—kick out that man with the segar, and a half, and a half—going, going—thirty-five, thirty-five—thirty-seven a half—plague take the segar smoker!—and a half, and a half—I'd rather have the devil about me—and a half, and a half, and a half—it gives me the phthisic—and a half, and a half, and a half—going, going—forty, forty cents—forty-two and a half—who's putting the brimstone on the stove?—and a half, and a half, and a half—I wish I had hold of that boy—and a half, and a half—I'd choke the rascal—and a half, and a half, going, going—who says forty-five—not half the price of the book—and a half, and a half, and a half—forty-two and a half—forty-five—now forty-seven and a half, and a half—a Treatise on the Tooth-ache, gentlemen—who'll give fifty cents for the tooth-ache, hand a half, and a half—forty-seven and a half—look at that boy there—and a half, and a half—pocketing one of those pen-knives—and a half, and a half—I can't have my eyes every where—and a half, and a half—fifty—fifty-two and a half—kick all the boys out of the room—and a half, and a half—kick'em out I say—and a half, and a half, going, going, gone."—*New York Transcript.*

## EARLY COACHES.

We have often wondered how many months' incessant travelling in a post-chaise it would take to kill a man; and wondering by analogy, we should very much like to know how many months of constant travelling in a succession of early coaches an unfortunate mortal could endure. Breaking a man alive upon the wheel would be nothing to breaking his rest, his peace, his heart—everything but his fast—between four and five; and the punishment of Ixion (the only practical person, by the bye, who has discovered the secret of the perpetual motion) would sink into utter insignificance before the one we have suggested. If we had been a powerful churchman in those good old times when blood was shed as freely as water, and men were mowed down like grass, in the sacred cause of religion, we would have lain by very quietly till we got hold of some especially obstinate miscreant, who positively refused to be converted to our faith, and then we would have booked him for an inside place in a small coach, which travelled day and night; and securing the remainder of the places for stout men with a slight tendency to coughing and spitting, we would have started him forth on his last travels, leaving him mercilessly to all the tortures which the waiters, landlords, coachmen, guards, boots, chambermaids, and other familiars on his line of road, might think proper to inflict.

Who has not experienced the miseries inevitably consequent upon a summons to undertake a hasty journey? You receive an intimation from your place of business—wherever that may be, or whatever you may be—that it will be necessary for you to leave town without delay. You and your family are forthwith thrown into a state of tremendous excitement; an express is immediately dispatched to the washerwoman's; everybody is in a bustle; and you, yourself, with a feeling of dignity which you cannot altogether conceal, sally forth to the booking-office to secure your place. Here a painful consciousness of your own unimportance first rushes on your mind—the people are as cool and collected as if nobody were going out of town, or as if a journey of a hundred odd miles were a mere nothing. You enter a mouldy-looking room, ornamented with large posting-bills, the greater part of the place enclosed behind a huge lumbering rough counter, and fitted up with recesses that look like the dens of the smaller animals in a travelling menagerie, without the bars. Some half dozen people are "booking" brown paper parcels, which one of the clerks flings into the aforesaid recesses with an air of recklessness, which you, remembering the new carpet-bag you bought in the morning, feel considerably annoyed at; porters, looking like so many Atlas's, keep rushing in and out with large packages on their shoulders; and while you are waiting to make the necessary inquiries, you wonder what on earth the booking-office clerks can have been before they were booking-office clerks; one of them with his pen behind his ear, and his hands behind him, is standing in front of the fire, like a full-length portrait of Napoleon; the other fellow with his hat half off his head, enters the passengers' names in the books with a coolness which is inexpressibly provoking; and the villain whistles—actually whistles—while a man asks him what the fare is outside, all the way to Holyhead! in frosty weather too! They are clearly an isolated race, evidently possessing no sympathies or feelings in common with the rest of mankind.

Your turn comes at last, and having paid the fare, you tremblingly inquire—"What time will it be necessary for me to be here in the morning?" "Six o'clock," replies the whistler, carelessly pitching the sovereign you have just parted with into a wooden bowl on the desk. "Rather before than arter," adds the man with the semi-roasted unmentionables, with just as much ease and complacency as if the whole world got out of bed at five. You turn into the street, ruminating, as you bend your steps homewards, on the extent to which men become hardened in cruelty by custom.

If there be one thing in existence more miserable than another, it most unquestionably is the being compelled to rise by candle-light. If you ever doubted the fact, you are painfully convinced of your error, on the morning of your departure. You left strict orders, over night, to be called at half-past four, and you have done nothing all night but doze for five minutes at a time, and start up suddenly from a terrific dream of a large church-clock with the small-hand running round with astonishing rapidity, to every figure on the dial-plate. At last, completely exhausted, you fall gradually into a refreshing sleep—your thoughts grow confused—the stage-coaches, which have been "going off" before your eyes all night, become less and less distinct, until they go off altogether: one moment you are driving with all the skill and smartness of an experienced whip—the next you are exhibiting, *à la Ducrow*, on the off-leader: anon you are closely muffled up, inside, and have just recognized in the person of the guard, an old school-fellow, whose funeral, even in your dream, you remember to have attended eighteen years ago. At last you fall into a state of complete oblivion, from which you are aroused, as if into a new state of existence by a singular illusion. You are apprenticed to a trunk-maker; how, or why, or when, or wherefore, you don't take the trouble to inquire; but there you are, pasting the lining in the lid of a portmanteau. Confound that other apprentice in the back-shop, how he is hammering!—rap, rap, rap—what an industrious fellow he must be; you have heard him at work for half an hour past, and he has been hammering incessantly the whole time. Rap, rap, rap, again—he's talking now—what's that he said? Five o'clock! You make a violent exertion, and start up in bed as if you were rehearsing the tent scene in *Richard*. The vision is at once dispelled; the trunk-maker's shop is your own bedroom, and the other apprentice your shivering servant, who has been vainly endeavouring to wake you for the last quarter of an hour, at the imminent risk of breaking either his own knuckles or the panels of the door.

You proceed to dress yourself with all possible dispatch. The flaring flat candle with the long snuff, just gives light enough to show that the things you want are not where they ought to be, and you undergo a trifling delay in consequence of having carefully packed up one of your boots in your over anxiety of the preceding night. You soon complete your toilette, however, for you are not particular on such an occasion, and you shaved yesterday evening; so mounting your Petersham great coat and green travelling shawl, and grasping your carpet-bag in your right hand, you walk lightly down stairs lest you should awake any of the family; and after pausing in the sitting-room for one moment, just to have a cup of coffee (the said sitting-room looking remarkably

comfortable, with every thing out of its place, and strewed with the crumbs of last night's supper,) you undo the chain and bolts of the street-door, and find yourself fairly in the street.

A thaw, by all that's miserable! The frost is completely broken up. You look down the long perspective of Oxford-street, the gas-lights mournfully reflected on the wet pavement, and can discern no speck in the road to encourage the belief that there is a cab or a coach to be had—the very coachmen have gone home in despair. The cold sleet is drizzling down with that gentle regularity which betokens a duration of four-and-twenty hours at least; the damp hangs upon the house-tops, and lamp-posts, and clings to you like an invisible cloak. The water is "coming in" in every area—the pipes have burst—the water-butts are running over—the kennels seem to be doing matches against time—pump-handles descend of their own accord—horses in market-carts fall down, and there's no one to help them up again—policemen look as if they had been carefully sprinkled with powdered glass—here and there a milk-woman trudges slowly along, with a bit of list round each foot to keep her from slipping—boys who "don't sleep in the house," and an't allowed much sleep out of it, can't wake their masters by thundering at the shop-door, and cry with the cold—the compound of ice, snow, and water on the pavement is a couple of inches thick—nobody ventures to walk fast to keep himself warm, and nobody could succeed in keeping himself warm if he did.

It strikes a quarter-past five as you trudge down Waterloo-place on your way to the Golden-cross, and you discover for the first time that you were called about an hour too early. You have not time to go back; there is no place open to go into, and you have therefore no resource but to go forward, which you do, feeling remarkably satisfied with yourself, and every thing about you. You arrive at the office, and look wistfully up the yard for the Birmingham High-flyer, which, for aught you can see, may have flown away altogether; for no preparations appear to be on foot for the departure of any vehicle in the shape of a coach. You wander into the booking-office, which, with the gas-lights and blazing fire, looks quite comfortable by contrast—that is to say, if any place *can* look comfortable at half-past five on a winter's morning. There stands the identical book-keeper in the same position as if he had not moved since you saw him yesterday. As he informs you that the coach is up the yard, and will be brought round in about a quarter of an hour, you leave your bag and repair to "The Tap"—not with any absurd idea of warming yourself, because you feel such a result to be utterly hopeless, but for the purpose of procuring some hot brandy and water, which you do—when the kettle boils; an event which occurs exactly two minutes and a half before the time fixed for the starting of the coach.

The first stroke of six peals from St. Martin's church steeple just as you take the first sip of the boiling liquid. You find yourself at the booking-office in two seconds, and the tap-waiter finds himself much comforted by your brandy and water in about the same period. The coach is out; the horses are in, and the guard and two or three porters are stowing the luggage away, and running up the steps of the booking-office, and down the steps of the booking-office with breathless rapidity. The place which a few minutes ago was so still and quiet, is now all bustle; the early vendors of the morning papers have arrived, and

and you are assailed on all sides with shouts of "*Times*, genlm'n, *Times*," "*Here's Chron—Chron—Chron*," "*Herald*, ma'am," "*Highly interesting murder, genlm'n*," "*Curious case o' breach o' promise, ladies*," &c., &c. The inside passengers are already in their dens, and the outsides, with the exception of yourself, are pacing up and down the pavement to keep themselves warm; they consist of two young men with very long hair, to which the sleet has communicated the appearance of chrystallized rat's tails, one thin young woman, cold and peevish, one old gentleman, ditto ditto, and something in a cloak and cap, intended to represent a military officer; every member of the party with a large stiff shawl over his chin, looking exactly as if he were playing a set of Pan's pipes.

"Take off the cloths, Bob," says the coachman, who now appears for the first time, in a rough blue great coat, of which the buttons behind are so far apart that you can't see them both at the same time. "Now, genlm'n," cries the guard, with the way-bill in his hand, "Five minutes behind time already!" Up jump the passengers—the two young men smoking like lime-kilns, and the old gentleman grumbling audibly. The thin young woman is got upon the roof by dint of a great deal of pulling, and pushing, and helping, and trouble, which she repays by expressing her solemn conviction that she'll never be able to get down again. "All right," sings out the guard at last, jumping up as the coach starts, and blowing the horn directly afterwards in proof of the soundness of his wind. "Let 'em go, Harry, give 'em their heads," cries the coachman—and off we start as briskly as if the morning were "all right," as well as the coach, and looking forward as anxiously to the termination of our journey, as we fear our readers will have done long since, to the conclusion of our article. BOZ.

## UPON POISONS AND POISONING.

The animal poisons, which first come under our notice, include the sting and bite of certain animals, and others when taken internally as food. And, first, of the bite of serpents—a very large class of reptiles, of which, however, Plenck assures us that only twenty-four species are venomous. Of these, Europe has only five, and Britain, happily, but one—the common viper or adder. There is a marked difference between the teeth of the innocuous and poisonous snakes: in the former there are four rows, two towards the palate and two towards the front of the jaw; while in the poisonous kinds there are only two of these parallel rows—namely, the palatine teeth—and, instead of the others, there are simply two large fangs projecting towards the edge of the mouth, and these are the poisonous fangs. The venom of these animals is contained in a bag situated on both sides of the head, which, when the animal intends to bite, it presses, by means of a muscular arrangement for the purpose, and the poison flows from it along a duct to the base of the tooth, which is moveable, very sharp, and hollowed throughout its length; through this canal the poison progresses, and issues into the wound by the opening which is near its end, for the point of the tooth itself is hard and solid. If these fangs be removed, or their structure destroyed, the animal is rendered harmless; and thus mountebanks are wont, whenever they suffer vipers to bite them before spectators, to stop with cement the perforations of the teeth, or destroy the glands in which the poison is secreted. The only

venomous serpents in Britain, as we have already mentioned, is the viper, and the power of that reptile is so slight and feeble, as not in general to endanger the life of man. Small animals may be killed by a viper, but its bite does not usually kill a dog; according to the experiments of Forster, it requires three or four viper bites to kill a dog. Circumstances, however, such as great debility of body, disturbance and irregularity of the digestive apparatus, or unusual heat of the season, have sometimes led to fatal results in the human subject.

In the treatment of injuries of this kind, the principal object is to prevent the passage of the poison from the wounded part into the body; and hence it is of advantage to apply a tight ligature above the bite, that is between it and the heart. This of course is only advisable to be done immediately after the accident; for, if swelling has taken place, it is likely to do more harm than good. The part is to be most carefully washed, so as to remove all venomous matter, and then the surface of the wound may be pared out with a sharp penknife; at any rate, it should be well scarified and laid open, to afford the opportunity of more complete ablation. These means will generally suffice when the bite has been inflicted by the British viper; but with regard to other species, the symptoms which come on are so serious, the rapidity of their progress so great and so fatal, that very little can be done. Besides the means we have recommended, powerful stimulants are to be given internally, and the best, perhaps, is hartshorn. In the East Indies, the natives administer a remedy which has been called the *Tanjore pile*, the chief ingredient of which has been discovered to be arsenic; but such means scarcely any but a medical man would be justified in resorting to.

It is somewhat singular that the poison of serpents should be perfectly inert when taken into the stomach, a fact, however, which appears to have been known from the earliest ages, when such wounds were sucked with impunity; and we learn, when Cato marched the remains of Pompey's army through Africa, he wisely informed the soldiers that they might drink of the waters that contained serpents without injury to themselves. Thus, the bite of a single viper will very speedily deprive a pigeon of life, and a single bite by no means exhausts the whole poison of the gland; but a piece of bread moistened with the whole poison of ten vipers, and given to a pigeon, will produce no effect. To be effectual, therefore, it is necessary that the poison of serpents should be applied to a recent wound. It may be applied to the surface of the body without any harm accruing,

The bite of many foreign snakes is attended with peculiarly dreadful consequences. The author of the "Excursions in New South Wales," speaking of the result of a bite from the death or deaf adder, says, "immediate decomposition commenced, and, in a very short space of time, the body was in such a state that it was with difficulty removed to where the grave had been dug. My informant," he says, "who had been twenty-two years in the colony, emphatically added, that when a person is bitten by a death adder, he has scarcely time to exclaim, 'Lord have mercy upon me!' before he becomes a lifeless corpse. It is affirmed that, in Africa," continues this author, "there are several, the bite of which causes a most horrible death. The person bitten feels drowsy, and the form melts at once into a mass of putrefaction. The burning snake of India can cause instant death, the blood flowing from the eyes, nose, mouth, and ears, and exuding from the pores. An American serpent, called *de la cruz*, is said to kill in the

same manner; finally, the bite of the *najer* is represented to be so fatal, that a person bitten by one will die in the course of half an hour." But these are foreign to our present purpose, and we shall proceed to the bite of rabid or mad animals; at the head of which stands the dog.

The term hydrophobia, which means a fear of water, is applied to that dreadful, and as far as our present knowledge extends, invariably fatal disease, arising from the bite of rabid animals, and produced in the human frame by the introduction of a poison peculiar to animals affected with canine madness. This poison is introduced with the saliva; that is, the saliva of animals labouring under the disease acquires the dreadful property of communicating it to man or other animals when infused into their system. We will not in this place inquire if any other fluid than the saliva can communicate the disease; we believe there is none, nor do we think that the perspiration or breath of an infected animal can communicate it, and still less do we think it ever arises spontaneously; but these discussions do not accord with our present purpose. The dog, wolf, fox, cat, with the horse, ass, mule, cow, sheep, pig, and perhaps the goat, are liable to hydrophobia; but there is reason for believing the disease can only be communicated by the dog, wolf, fox, and cat. The wolf suffers much from the disease; and the late Duke of Richmond lost his life in consequence of hydrophobia contracted from the bite of a fox in Canada. When a dog labours under the complaint, his manner becomes much altered; he is peevish and sullen; he scarcely will notice those to whom he has been accustomed; he will get away from home and wander about. He will not go out of his way to attack individuals or brute animals, but he is very apt to bite those who come across him. He picks up and swallows small objects; straw, bits of grass, and dirty substances of any kind. When he is tied up, and towards the latter period of the complaint, he will gnaw and bite the objects around him; he will grow angry, and become very wild in his appearance; his jaws are continually covered with tough saliva; and at last he dies in all the horrors of confirmed madness. The disease is usually communicated to the human subject by a bite; in fact, the saliva of a rabid animal must be brought into contact with a recent wound, or with an ulcer or abraded surface; and it is not absolutely necessary that this should be done through the medium of a bite. Not long ago, a lady of rank had a French poodle, of which she was very fond, and allowed to lick her face. She had a small pimple on her chin, of which she had rubbed off the top; and allowing the dog to indulge in its usual caresses, it licked this pimple, of which the surface was exposed, and thus she acquired the disease of hydrophobia, of which she died. Wounds are not equally effective in conveying the poison, particularly if a person is bitten on a part covered with clothes; in which case the teeth of the animal are in a manner wiped or cleaned by passing through the cloth. An interval of time elapses between the infliction of the wound and the appearance of any symptoms; generally speaking, the disease shows itself between the thirtieth and fortieth day. The only symptom to which we shall allude is an extraordinary aversion or dread of drink which seizes the unfortunate patient; this, when added to the excessive degree of salivation with which it is accompanied, leave no doubt us to the cause.

With regard to the treatment of hydrophobia, we know of none; but much may be done in the way of prevention; and the means we are about to recommend should be put in practice after every, or any,

bite, no matter how slight, that is received from a dog or other animal. They are simple in themselves, and will generally prevent much fear and anxiety, if not on the part of the patient, among his friends and connections. Very hot water should be poured from a tea-kettle into the wound, the vessel being held four or five feet above it; if a common syringe, or squirt, is at hand, the water should be injected into the wound; and this ablution should be carried on for three or four hours. Burning the part with caustic is not a safe method, as we cannot be certain of applying it to the whole wound; and some of the saliva may perhaps escape being touched with it. Indeed, the only plan entirely to be depended upon, is cutting out the bitten part; taking care that all the flesh with which the animal's teeth came in contact be removed. If this be effectually done, there can be no fear of hydrophobia; and if a medical man or qualified person cannot be procured within an hour or two, during which time the mode of washing we have recommended is to be persevered in, any body, with a sharp penknife might proceed with the operation; by doing so, the patient may be saved from a death most terrible to the individual, and most appalling to those interested in his well-being.

We have three species of wasp in Britain—the hornet, the common wasp, and the small wasp—each of which possesses the property of producing by its sting violent and painful inflammation; there are also seven species of the genus *apis*; the most remarkable of which are the small field-bee, the common hive-bee, the humble-bee, and the great humble-bee. The single sting of any of these cannot be regarded as attended with danger; and the same means of relief as recommended for the bites of vipers, may here also be employed. The supposed power of the toad to spit out a poisonous fluid, has, by many experiments, been so satisfactorily refuted that we need not enter upon the subject; this poor animal, though vilified and traduced, is perfectly innocuous.

With regard to poisonous fishes, and especially of the more common one, the mussel, we are inclined to think that much depends upon the unhealthy condition of the animal, and the peculiar habit of body of the individual eating it. Every body is aware that one person may harmlessly eat of a fish which disagrees with another; and also, that substances the least putrescent, as long-kept game, &c., are highly injurious. But much obscurity attends this department of our subject; we know, however, that the softest kinds of fish become soonest putrid, and hence we see the policy of the Hebrew legislator—"Whatsoever hath no fins nor scales in the waters, that shall be an abomination unto you."

If a case of poisoning from eating fish should present itself, we cannot do better than administer an emetic, and the best is a teaspoonful of mustard in a tumbler of warm water; and this should be followed by a smart purgative dose.

We now come to a consideration of those poisons which belong to the vegetable kingdom. In this department of our subject we may begin with the poisonous vegetable substances which are found growing wild among our hedges, our plains, our woods, and hills, and which may become the agents of much uneasiness, or even death, to the unsuspecting and unwary. And, first, of a very common plant in England, but rare in Scotland, and of a highly poisonous nature—the wild vine or bryonia (*Bryonia diacia*); the flowers of which are greenish, with small red berries, and a spindle-shaped root, like a radish or carrot, which has a very fetid smell: it was formerly employed in medicine, but is now banished from the pharmacopœia. A small quantity of it is poisonous,

producing violent inflammation of the bowels. Of the several species of the ranunculus, common every where, the same may be said; and many unpleasant accidents have been occasioned by them. So powerful is the action of these plants, that, when bruised and applied to the skin, they cause small ulcers to arise; and thus beggars often employ them as a means of exciting commiseration. So common is this practice, that, on the Continent, the ranunculuses or buttercups have obtained the name of *herbe aux gueux*, or beggar's plants. They carry with them, however, a punishment for those who use them, as the sores they create are both painful and difficult to heal. The anemone is another poisonous plant; and the *Caltha palustris*, the marsh marigold, or May-flower, is a powerful acid. The stavesacre (*Delphinium staphysagria*) and the clematis—

—"The favoured flower,  
Which boasts the name of virgin's bower"—

must also be avoided, as well as all the daffodil tribe. The mezereon is a poisonous species of *Daphne*, which all must have admired in March, when, as Cowper sings, it is,

"Though leafless, well attired, and thick beset  
With blushing wreaths, investing every spray."

The singular beauty of the berries of this plant has often tempted children to eat of them, and sometimes caused their death. Linnaeus says that six berries will kill a wolf, and he once saw a girl die from eating twelve of them.

The subject of Vegetable poisons will be concluded, along with a notice of poisons of a mineral nature, in a subsequent article.

## OBSERVATIONS ON GELDING.

BY MR. R. THOMSON, BEITH, N. B.—ADDRESSED  
TO MR. DICK.

(From the Veterinarian.)

I have made many experiments as to the use of the ligature in the castration of colts and horses, and the removal of this ligature on the second or third day. However humane the plan may appear, there are serious objections to it. Suppuration, in the generality of these cases, does not commence until the fifth day—rarely sooner, and sometimes later. Inflammation of the scrotal portion of the peritoneum must extend more or less during that period, and its progress is not arrested until suppuration commences. The protracted time must, in this mode of operating, be more dangerous, especially in fiery blood colts. I have cut about ten colts, using this operation. Some did remarkably well: in others the swelling was very great before suppuration commenced. In one that died it was uncommonly large. Suppuration did not commence until the sixth day. The animal got better at that time—the swelling subsided—but he died about two months afterwards. The adhesive inflammation, by being so long protracted, had done so much mischief that the scrotum, peritoneum, and chord, were all glued into one mass. Fomentation, bleeding, and laxatives, were employed in vain. The colt was a wild fiery animal, half bred.

I have cut a good many bulls in the same way, and there does not appear to be the least bad consequence attending this plan with regard to them. I have scarcely seen any swelling, although I gelded three in one day, in the very heat of summer.

The first colt gelded by me did remarkably well: it was three years old, and the success of the plan

made me persevere until I saw its danger ; and I will gild no more upon that principle, unless particularly requested to do so.

The success of common gelders, in my opinion, is founded on this, that however coarsely the operation be done, and however unmerciful may be the application of the hot iron, there is an almost immediate tendency given to suppuration ; suppuration does make its appearance much sooner after the iron than after the ligature ; and the patient is always considered, in a manner, out of danger when the parts begin to suppurate, unless immediate inflammation of the peritoneum followed, and mortification has taken place.

I am quite aware that you are a great advocate for firing nothing more than the vessels, and so am I likewise. I would fire no more than necessary. I well remember that, when seeing you castrating (and I was extremely anxious to see you perform that operation), no more was generally fired than the mouth of the artery. There is one small artery on the posterior part of the chord that cannot well be fired without touching a portion of the peritoneum. This small portion of it being touched with the iron suppurates ; the rest of the divided portion gradually follows from that point where the cautery touches the peritoneum upon the chord, and prevents the adhesive inflammation from ascending far upon it, in consequence of the suppurative process more or less taking place in a very short time after firing. So that I consider the practice of firing the divided surface of the chord safer than tying, or even than firing no more than the mouths of the arteries ; for if the least portion of peritoneum upon the chord be touched with the cautery, it forms a point for suppuration, and answers the object as well as the old plan of burning the chord like a cinder.

I am aware that it may be argued that, by firing the points of the arteries a suppurative point is formed in the chord ; but the chord and the peritoneum covering it are distinct, and suppuration may take place extensively in the chord, as is sometimes the case in fistulous abscess of that part, without much affecting the peritoneum covering it.

I consider the caustic clams as operating upon the same principle. The caustic burns the peritoneum and the chord ; suppuration immediately follows, the scrotum is left open while the clams are upon it, and allows the fluid to escape there which forms between the peritoneum and testicle, and in a great measure prevents the swelling and discharge from being so abundant as in firing or tying the arteries. I do not mean to argue that bad consequences would always attend tying the arteries, or only firing the mouths of the two arteries of the chord ; but what I argue is this,—if a small portion of peritoneum is fired or burnt with caustic, the operation would be comparatively safer, as it cannot be denied that suppuration always follows castration, more or less, and the sooner the better ; and inflammation of the peritoneum, to any extent, without suppuration, is always dangerous in gelding.

If suppuration follows the operation of firing in two or three days, it must be safer than when prolonged to five or six days, as in tying the arteries.

### COMPARISON OF MEN WITH ANIMALS.

Of all the species of animals which exist on the surface of the earth, man alone exhibits an ex-

cessive disparity in his attainments at remote periods of his history. In animals, each individual attains the complete use of all its faculties ; and this even though successive generations of the tribe be separated from each other by a long lapse of time. With many animals nothing in the shape of instruction is needed. The insect tribes at once proceed in the course that nature has designed for them. No sooner does the egg burst, than the larva sets itself about the business of its existence ; it swims expertly through the water, and seeks out its appropriate food. Led on by an unerring instinct, it approaches the surface of the pool, or climbs the stalk of some aquatic plant ; and ere the spectator has time to mark the change, it launches off into an untried element, and is undistinguished amid the thousands that have had the long experience of an hour. Some, again, wake to life in the tough bark, and eat their vermicular way through the sap-wood ; till, when the metamorphosis draws near, they suck the outer rind, cut it with their mandibles, elevate their elytra, unfold from beneath their delicate wings, and use with the utmost ease their newly acquired powers and senses. Ascending (as it is termed) the scale of existence, we find the elements of tuition begin to appear. The birds, for the most part, educate their young ; they lead them by short flights to seek their food, and only abandon them after their powers are fully developed. The same remark holds good of many of the quadrupeds. In all cases, however, the powers arrived at are nearly the same, with each individual of a species. But when we reach the top of the scale, how different ! The young of the human species receive not merely that tuition which is common to all mammalia, but also a distinct kind of education, which conveys the fruits of the experience of all the preceding generations. Man lives to add to that experience ; and, though his physical powers reach to their full development, the entire man knows nothing of maturity. Powers of which our ancestors were ignorant, are now wielded by us ; while we, in our turn, are opening the way for other and more transcendent powers to be employed by our descendants. The burrowing bee still uses the same instrument to pierce the downright shaft, and to cluster round it the beautifully-smoothed cells. Still she selects the hard-beaten soil, whence the wind may sweep the dust that otherwise would betray her labours. The sand-spider still uses the same cement to form the walls of her retreat, and to weave her branchy net. But man is found at one time burrowing himself in the ground, at another tearing the rocks to rear magnificent palaces. Here he draws his sustenance from the ocean, there he cultivates the ground ; here he clothes himself in the skin of the wild beast, there he wears the delicate web, and prides himself in the splendour of his apparel. With man there is no permanence ; every thing is changing, and each season adds to his powers and comfort. He seems to possess an endless variety of appetites, that are only called into action as opportunity offers for their gratification ; there lurks within him an immense variety of powers, of which only a few are called into active use by any individual. Among animals, the history of an individual is almost the history of the race ; but the story of the life of man is ever changing ; and the mode of living of one nation appears incredible to another. Man is possessed of a highly muscular and pliable form, capable of enduring long and vigorous exertion ; the tenderness of his limbs prohibits the direct employment of his powers. The animals are in-

variably supplied with instruments fit for the various operations they have to perform. The bee has the proboscis to reach the nectary; the burrowing animals have claws for digging the earth, and the beasts of prey for tearing their food. But man works by tools. The capability of employing inanimate matter—of making it, as it were, a part of himself, is peculiar to man: only faint traces of that power are to be perceived among the animal tribes. In man it is completely developed; for, on reflection, we at once perceive that almost every operation which we perform, is done by the assistance of tools of one kind or another.—*Edinburgh Philosophical Journal*.

### ON HORSE FEEDING.

MR. EDITOR,—Though the plan of feeding horses with wheat instead of oats has been adopted in a few instances, I am much surprised that it is not more generally acted upon, when as at present, a pound of sweet sound wheat, (a grain containing a greater proportion of the nutritive principle than any other,) may be bought for as little or less money than the same weight of Oats. It is objected to the use of wheat as food for the horse or any other herbivorous animal, that it is apt to disend the stomach and produces bad consequences. This I admit it will do if it be given in its natural state, but every evil result is averted either by boiling the grain until it be burst or nearly so (which I consider the best mode of preparation) by steeping until the maximum of distension be attained or by pounding or breaking in a mill. I find that about 2½ quarts of raw wheat will, when boiled, make two good feeds. It may be given *either warm or cold* (as frequently as it is usually the practice to give corn) mixed with a small quantity of ground oats, bran, shuders or chopped hay, and any water which the wheat may not have absorbed in the boiling, should either be mixed with one of the before mentioned ingredients (thus forming a mash of the whole) or given to the animal to drink. This mode of treatment has been found not only in my own practice, but in that of many of my friends, to improve the wind, increase the capability for work, and promote that state of general health, technically called *condition*, in so much greater a degree than has been attained by any other system of diet, that I hope you may not consider it an encroachment on your columns when I request the favour of the insertion of this letter, wishing as I do, to recommend a trial of the plan I have described to such of your readers as are owners of a horse or horses.

I am, Sir, yours respectfully,  
April 11, 1835. VETERINARIUS.

### THE LAMENT OF POOR TOBY, THE LEARNED PIG.

"A little learning is a dangerous thing."—*Pope*.

O HEAVY day! oh day of wo!  
To misery a poster:  
Why was I ever farrow'd—why  
Not spitted for a roaster?

In this world, pigs, as well as men,  
Must dance to fortune's fiddlings;  
But must I give the classics up  
For barley-meal and middlings?

Of what avail that I could spell,  
And read, just like my betters,  
If I must come to this at last,—  
To litters, not to letters?

O! why are pigs made scholars of?  
It baffles my discerning,  
What griskins, fry, and chitterlings  
Can have to do with learning.

Alas, my learning once drew cash,  
But public fame's unstable;  
So I must turn a pig again,  
And fatten for the table.

To leave my literary line  
My eyes get red and leaky;  
But Giblett doesn't want me *blue*,  
But red and white, and streaky.

Old Mullins used to cultivate  
My learning like a gard'ner;  
But Giblett only thinks of lard,  
And not of Doctor Lardner.

He does not care about my brain  
The value of two coppers;  
All that he thinks about my head  
Is, how I'm off for choppers.

Of all my literary kin  
A farewell must be taken;  
Good bye to the poetic Hogg!  
The philosophic Bacon!

Day after day my lessons fade,  
My intellect gets muddy;  
A trough I have, and not a desk,  
A sty—and not a study.

Another little month, and then  
My progress ends, like Bunyan's;  
The seven sages that I lov'd  
Will be chop'd up with onions!

Then over head and ears in brine  
They'll souse me, like a salmon;  
My mathematics turned to brawn,  
My logic into gammon.

My Hebrew will all retrograde,  
Now I'm put up to fatten;  
My Greek, it will go all to grease,  
The dogs will have my Latin.

Farewell to Oxford! and to Bliss!  
To Milman, Crowe, and Glossop,  
I now must be content with chats,  
Instead of learned gossip!

Farewell to 'Town!' farewell to 'Gown!'  
I've quite outgrown the latter;  
Instead of trencher cap, my head  
Will soon be in a platter!

O! why did I at Brazen-Nose  
Rout up the roots of knowledge?  
A butcher that can't read will kill  
A pig that's been to college!

For sorrow I could stick myself—  
But conscience is a clasher;  
A thing that would be rash in man,  
In me would be a rasher!

One thing I ask,—when I am dead,  
And past the Stygian ditches—  
And that is,—Let my schoolmaster  
Have one of my two fitches.

'Twas he who taught my letters so  
I ne'er mistook or miss'd 'em;  
Simply by *ringing* at the nose,  
According to *Bell's system*.—*Comic Annual*.

## TRAVELLING IN ENGLAND THIRTY YEARS AGO.

Upon this subject there appears an entertaining well-written article in the twelfth number of Tait's Edinburgh Magazine, published a few weeks ago, from which we present the following sketch:—“Whilst reverting to these remembrances of my childhood (says the writer,) I may add by way of illustration, and at the risk of gossiping, a brief notice of my very first journey. I might be then seven years old. A young gentleman, the son of a wealthy banker, had to return home for the Christmas holidays to a town in Lincolnshire, distant from the public school, where he was pursuing his education, about a hundred miles. This school was in the neighbourhood of my father's house. There were at that time no coaches in that direction; now there are many every day. The young gentleman advertised for a person to share the expense of a post-chaise. By accident, or chiefly, I believe, out of compliment to the gentleness of my manners, and the depth of my affections, I had an invitation of some standing to the same town, where I happened to have a female relation of mature age, besides some youthful cousins. The two travellers-elect soon heard of each other, and the arrangement was easily completed. It was my earliest migration from the paternal (or, as I ought *then* to call it, the maternal) roof; and the anxieties of pleasure, too tumultuous, with some slight sense of undefined fears, combined to agitate my childish feelings. I had a vague slight apprehension of my fellow-traveller, whom I had never seen, and whom my nursery-maid, when dressing me, had described in no very amiable colours. But a good deal more I thought of Sherwood Forest, which, as I had been told, we should cross after the night set in. At six o'clock, I descended, and not, as usual, to the children's room but, on this special morning of my life, to a room called the breakfast-room, where I found a blazing fire, candles lighted, and the whole breakfast equipage, as if for my mother, set out, to my astonishment, for no greater personage than myself. The scene being in England, and on a December morning, I need scarcely say that it rained; the rain beat violently against the windows, the wind raved; and an aged servant who did the honours of the breakfast table, pressed me urgently and often to eat. I need not say that I had no appetite; the fulness of my heart, both from busy anticipation, and from the parting which was at hand, had made me incapable of any other thought, or feeling or attention, but such as pointed to the coming journey.

Thirty-nine, or possibly I believe even forty years, have passed since that December morning in my own life to which I am now recurring, and yet, even to this moment, I recollect the audible throbbing of heart, the leap and rushing of blood, with which, during a deep lull of the wind, the aged attendant said, without hurry or agitation, but with something of a solemn tone, ‘That is the sound of wheels; I hear the chaise. Mr. H——! will be heard directly.’ The road ran for some distance by a course pretty nearly equidistant from the house, so that the groaning of the wheels continued to catch the ear, as it swelled upon the wind, for some time without much alteration. At length a right-angled turn brought the road continually and rapidly nearer to the gates of the grounds, which had purposely been thrown open. At this point, however, a long career of raving arose; all other sounds were lost; and for some time I began to think we had been mistaken, when suddenly the loud trampling of horses' feet, as they whirled up the sweep below the windows,

followed by a peal long and loud upon the hell, announced, beyond question, the summons for my departure. The door being thrown open, steps were heard loud and fast; and, in the next moment, ushered by a servant, stalked forward, booted and fully equipped, my travelling companion—it such a word can at all express the relation between the arrogant young blood, just fresh from assuming the *toga virilis*, and a modest child of profound sensibilities, but shy and reserved beyond even English reserve. The aged servant, with apparently constrained civility, presented my mother's compliments to him with a request that he would take breakfast. This he hastily and rather peremptorily declined. Me, however, he condescended to notice with an approving nod, slightly inquiring if I were the young gentleman who shared his post-chaise. But without allowing time for an answer, and striking his boot impatiently with a riding-whip, he hoped I was ready. ‘Not until he has gone up to my mistress,’ replied my old protector, in a tone of some asperity. Thither I ascended. What counsels and directions I might happen to receive at the maternal toilet, naturally I have forgotten. The most memorable circumstance to me was, that I who had never till that time possessed the least or most contemptible coin, received, in a net-work purse, five glittering guineas, with instructions to put three immediately into Mr. H——!’s hands, and the rest when he should call for them. The rest of my mother's counsels, if deep, were not long; she who had always something of a Roman firmness, shed more milk of roses I believe, upon my cheeks, than tears; and why not? What should there be to her corresponding to an ignorant child's sense of pathos, in a little journey of about a hundred miles? Outside her door, however, there awaited me some silly creatures, women of course, old and young, from the nursery and the kitchen, who gave and who received those fervent kisses which wait only upon love without awe and without disguise.

I found myself lifted into the chaise: counsels about the night and the cold, flowing in upon me, to which my companion listened with derision and astonishment. I and he had each our separate corner; and, except to request that I would draw up one of the glasses, I do not think he condescended to address one word to me until dusk, when we found ourselves rattling into Chesterfield, having barely accomplished four stages, or forty or forty-two miles, in about nine hours. This, except on the Bath or great north roads, may be taken as a standard amount of performance in 1794 (the year I am recording,) and even ten years later. In these present hurrying and tumultuous days, whether time is really of more value, I cannot say; but all people on the establishment of inns are required to suppose it of the most awful value. Now-a-days, no sooner have the horses stopped at the gate-way of a posting-house, than a summons is passed down to the stables; and in less than one minute, upon a great road, the horses next in rotation, always ready harnessed when expecting to come on duty, are heard trotting down the yard. ‘Putting to,’ and transferring the luggage (supposing your conveyance a common post-chaise,) once a work of at least twenty minutes, is now easily accomplished in three. And scarcely have you paid the ex-postilion before his successor has mounted; the ostler is standing ready with the steps in his hands, to receive his invariable sixpence; the door is closed; the representative waiter bows his acknowledgment for the house, and you are off at a pace never less than ten miles an hour; the total detention at each stage not averaging above

four minutes. Then (*i. e.* at the latter end of the eighteenth and beginning of the nineteenth century) half an hour was the minimum of time spent at each change of horses. Your arrival produced a great bustle of unloading and unharnessing; as a matter of course you alighted and went into the inn; if you sallied out to report progress, after waiting twenty minutes, no signs appeared of any stir about the stables. The most choleric person could not much expedite preparations, which loitered not so much from any indolence in the attendants as from faulty arrangements and total defect of foresight. The pace was such as the roads of that day allowed; never so much as six miles an hour, except upon a very great road: and then only by extra payment to the driver. Yet even under this comparatively miserable system, how superior was England, as a land for the traveller, to all the rest of the world, Sweden only excepted.

What cozy old parlours in those days! low-roofed, glowing with ample fires, and fenced from the blasts of doors by screens, whose foldings were, or seemed to be, infinite! What motherly landladies! won, how readily, to kindness the most lavish, by the mere attractions of simplicity and youthful innocence, and finding so much interest in the bare circumstance of being a traveller at a childish age! Then what blooming young handmaidens, how different from the knowing and worldly demireps of modern highroads! And sometimes grey-headed faithful waiters, how sincere and how attentive, by comparison with their flippant successors, the eternal 'Coming sir,' 'Coming sir,' of our improved generation.

Such an honest old butler-looking servant waited on us during dinner at Chesterfield, carving for me, and urging me to eat. Even my companion found his pride relax under the influence of wine; and when loosened from this restraint, his kindness was not deficient. To me he showed it in pressing wine upon me, without stint or measure. The elegancies which he had observed in such part of my mother's establishment as could be supposed to meet his eye on so hasty a visit, had impressed him perhaps favourably towards myself: and could I have a little altered my age, or dismissed my excessive reserve, I doubt not that he would have admitted me, in default of a more suitable comrade, to his entire confidence for the rest of the road. Dinner finished, and myself at least, for the first time in my childish life, somewhat perhaps overcharged with wine, the bill was called for—the waiter paid in the lavish style of antique England—and we heard our chaise drawing up under the gateway—the invariable custom of those days, by which you were spared the trouble of going into the street, stepping from the hall of the Inn right into your carriage. I had been kept back for a minute or so by the landlady and her attendant nymphs, to be dressed and kissed; and, on seating myself in the chaise, which was well lighted with lamps, I found my lordly young principal in conversation with the landlord, first upon the price of oats, which youthful horsemen always affect to inquire after with interest; but secondly, upon a topic more immediately at his heart, *viz.* the reputation of the road. At that time of day, when gold had not yet disappeared from the circulation, no traveller carried any other sort of money about him; and there was consequently a rich encouragement to highwaymen, which vanished almost entirely with Mr. Pitt's act of 1797 for restricting cash payments. Property which could be identified and traced, was a perilous sort of plunder: and from that time the free trade of the road almost perished as a regular occu-

pation. At this period it did certainly maintain a languishing existence; here and there it might have a casual run of success; and as these local ebbs and flows were continually shifting, perhaps after all, the trade might lie amongst a small number of hands. Universally, however, the landlords showed some shrewdness, or even sagacity, in qualifying according to the circumstances of the inquirer, the sort of credit which they allowed to the exaggerated ill fame of the roads. Returning on this very road, some months after, with a timid female relation, who put her questions with undisguised and distressing alarm, the very same people, one and all, assured her that the danger was next to nothing. Not so at present: rightly presuming that a haughty cavalier of eighteen, flushed with wine and youthful blood, would listen with disgust to a picture too amiable and pacific of the road before him, Mr. Spread-Eagle replied with the air of one who feared more than he altogether liked to tell, and looking suspiciously amongst the strange faces lit up by the light of the carriage lamps—'Why, Sir, there have been ugly stories afloat; I cannot deny it; and sometimes, you know, sir,' winking sagaciously, to which a knowing nod of assent was returned, 'it may not be quite safe to tell all one knows. But you understand me. The forest, you are well aware, sir, is the forest: it never was much to be trusted, by all accounts, in my father's time, and I suppose will not be better in mine. But you must keep a sharp lookout: and Tom,' speaking to the postillion, 'mind when you pass the third gate, to go pretty smartly by the thicket.' Tom replied in a tone of importance to this professional appeal. General valedictions were exchanged, the landlord bowed, and we moved off for the forest. My companion had his travelling case of pistols: these he began now to examine; for sometimes said he, I have known such a trick as drawing the charge whilst one happened to be taking a glass of wine. Wine had unlocked his heart—the prospect of the forest and the advancing night excited him—and even of such a child as myself, he was now disposed to make a confidant. 'Did you observe,' said he, 'that ill-looking fellow, as big as a camel, who stood on the landlord's left hand?' 'Was it the man?' I asked timidly, 'who seemed by his dress to be a farmer?' 'Farmer, you call him? Ah! my young friend, that shows your little knowledge of the world. He is a scoundrel, the bloodiest of scoundrels. And so I trust to convince him before many hours are gone over our heads.' Whilst saying this, he employed himself in priming his pistols: then after a pause, he went on thus:—'No my young friend, this alone shows his base purposes—his calling himself a farmer. Farmer he is not, but a desperate highwayman, of which I have full proof. I watched his malicious glances whilst the landlord was talking; and I could swear to his traitorous intentions.' So speaking, he threw anxious glances on each side as we continued to advance; we were both somewhat excited: he by the spirit of adventure, I by sympathy with him—and both by wine. The wine, however, soon applied a remedy to its own delusions; three miles from the town we had left, both of us were in a bad condition for resisting highwaymen with effect—we were fast asleep. Suddenly a most abrupt halt awoke us; my friend felt for his pistols—the door flew open, and the lights of the assembled group announced to us that we had reached Mansfield. That night we went on to Newark, at which place about forty miles of our journey remained. This distance we performed of course on the following day, between breakfast and dinner.

But it serves strikingly to illustrate the state of roads in England whenever your affairs led you into districts a little retired from the capital routes of the public travelling, that for one twenty-mile stage, viz. from Newark to Sleaford, they refused to take us forward with less than four horses. This was neither a fraud, as our eyes soon convinced us (for even four horses could scarcely extricate the chaise from the deep sloughs which occasionally seamed the road for tracts of two or three miles in succession,) nor was it an accident of the weather. In all seasons the same demand was enforced, as my female protectress found in conducting me back at a fine season of the year, and had always found in traversing the same route. The England of that date (1794) exhibited many similar cases.

It was not until after the year 1815 that the main improvement took place in the English travelling system, so far as regarded speed. It is in reality to Mr. M'Adam that we owe it. All the roads in England, within a few years, were remodelled, and upon principles of Roman science. From mere beds of torrents, and system of ruts, they were raised universally to the condition and appearance of gravel walks in private parks or shrubberies. The average rate of velocity was, in consequence, exactly doubled—ten miles an hour being now generally accomplished, instead of five. And at the moment when all further improvement upon this system had become hopeless, a new prospect was suddenly opened to us by railroads; which again, considering how much they have already exceeded the maximum of possibility, as laid down by all engineers during the progress of the Manchester and Liverpool line, may soon give way to new modes of locomotion still more astonishing to our preconceptions."

### THE UNIONS.

All hail! to Hymen, the god of the *Unions*! never had the divinity such a crowd of worshippers! From the humble mender of soles to the valiant *ninth*, all trades and mysteries are flocking to his altar, and offering sacrifice.

The *Carpenters*, in plain terms, declare that their masters are old *files* and *screws*,—that their present wages are not sufficient to obtain *board*, much less lodging, and that they must and will have more *brads*.

The *Weavers*, according to the nautical phrase, "*loom*" large, and assert that their *frames* cannot be supported under the present system.

The *Shoe-makers* say their exertions are at present "bootless;" that their masters deserve to be *welted* for their conduct, and that they are resolved to stick out to the last.

The *Watch-makers* say every thing is *going wrong*, and requires immediate *regulation*. Instead of piece-work, they wish to work only for *time*! And, having joined the unions, they have now *wheels within wheels*, and expect there will be a new *spring* given to their business, and all their *hands* be employed. But, after all, they have said nothing more than all the rest of the malcontents, and of course may be regarded as *repeaters*. Their masters remonstrate in vain: they say *don't go*; but the men answer they are now *wound up*, and they will!

The *Tailors* have taken it into their heads to *suit* themselves, and have taken *measures* accordingly.

The *Locksmiths* have *bolted* from their benches, and, having deserted their *vices*, are *drilling* them-

selves into sobriety, in order to *file off* in an orderly manner before the commissioners. They are all on the *key vive*, and arranging their locks to look smart.

The *Coopers* have assumed the *casques* of war! and vow they will be *butts* no longer.

The *Wheelwrights* declare their masters are *knaves*, and by leaving off work they hope to 'put a *spoke* in their wheel!'

The *Blacksmiths* take advantage of the times, and *strike while the iron is hot*. They have *hammered out* a long list of grievances, numerous subscribed, although it is generally believed both the documents and signatures are *forged*.

The *Masons* have left their *marbles* to play a more serious game, and resolve to leave no *stone* unturned, till they obtain their wishes.

The *Printers* have given their governors sufficient *proofs* of their *impressions*, by deserting the *press*, and joining the *crowd* of complainants. Punctuation is at a *full stop*, and they threaten to make nothing but *pie* till they receive sufficient remuneration to obtain *bread* for their own consumption. It is expected the masters will be compelled to submit to *composition*.

The *Bakers* say they have long *needed* a reform, and turn out with the *flower* of the trade. Their *muster roll* is very long. From their martial appearance it would be supposed they were *bred* to war; at least they seem resolved to contest it manfully, and would rather be *dead men* than yield. Their *dernier resort* will be a petition to the master of the *rolls*.

The *Dyers*, warring against the course of nature, have refused to *dye*, and yet solemnly declare they will *die* first! There is no doubt they will come off with *flying colours*.—*Comic Offering*.

THE TEETH.—Many publications have appeared from time to time professing to give directions for the preservation of the teeth. We have however not met with any work in which Dental Surgery has been so systematically treated, and this too without destroying its practical utility in the hands of the unprofessional reader as in Mr. Mallan's "*Practical Observations on the Physiology and Diseases of the Teeth*." The rules for the preservation of the teeth which he lays down, are so simple and so easily adopted, that we feel confident all who study cleanliness, and value beauty and durability of the teeth, will lose no time in making themselves acquainted with and adopting them.

The beet-root growers and sugar manufacturers of the north of France have formed private clubs and committees to resist, they say, both the government and the colonies. The Minister is about to put a tax on home-grown sugar, which calls forth the opposition above alluded to. France, says the *Moniteur de Commerce* on this subject, is the worst market for raw sugar in the world. The first material sells better at New York and London than at Havre and Bordeaux. At the end of 1833 there were twenty two millions of pounds of colonial sugar unsold in bond in the French entrepôts. Double that quantity will be found to have been in the same state at the close of 1834. The merchants of Martinique have, on their side, petitioned against the high sugar-duty, and against the restrictions imposed. All the objects of consumptions, says their petition, with which France furnishes Martinique, might be had by that island from 10 to 50 per cent. cheaper.

## RAILROADS IN THE UNITED STATES.

A publication recently compiled by Mr. Tanner, gives a short description of all the canals and railroads in the United States, now completed or in progress—from which work the following is collected:—

|                             | CANALS.                 | RAILROADS.              |
|-----------------------------|-------------------------|-------------------------|
| New Hampshire . . . . .     | miles 834 $\frac{3}{4}$ | .....miles —            |
| Maine . . . . .             | 20 $\frac{1}{2}$        | ..... —                 |
| Massachusetts . . . . .     | 78 $\frac{1}{2}$        | ..... 116               |

*Alabama Intelligencer.*

**COALS.**—According to a return just made to the House of Commons, the quantity of coals brought coastwise and by inland navigation into the port of London in 1833 was 2,014,804 $\frac{1}{2}$  tons, and in 1834, 2,080,547 tons. From Newcastle there came, in 1833, 1,060,839 tons; in 1834, 1,142,903 tons. From Sunderland, in 1833, 666,787 tons; in 1834, 559,105 tons. From Stockton, in 1833, 170,690 tons; in 1834, 221,971 tons. From Blythe and Seaton, in 1833, 48,689 tons; in 1834, 64,268 tons. From Leith, Inverkeithing, Kirkcaldy, and other ports in Scotland, in 1833, 15,138 tons; in 1834, 39,487 tons. From Swansea, Llanelly, Milford, and other places in Wales, in 1833, 32,156 tons; in 1834, 33,200 tons. From Hull, Goole, Gisborough, and other places in Yorkshire, in 1833, 16,110 tons; in 1834, 17,751 tons. Quantity which passed the boundary stones on the Grand Junction Canal at Grove-park, Herts, and on the River Thames, at Staines, in 1833, 4,395 $\frac{1}{2}$  tons; in 1834, 4,862 tons.

**BAKING THE BAKER.**—During the reign of Hammooda Basha, the Kaeed, who, according to custom, had made his rounds, and had ascertained from different travellers what they had paid for their provisions, found that one of them had purchased a certain quantity of bread, which was found deficient in weight when placed in the Kaeed's scales. The party proceeded to the baker's, whose scales gave exactly the weight at which he had sold the bread; on this the Kaeed had them broken, when they were found to contain a quantity of quicksilver in a hollow tube, which could thus be made to throw its balance on either side. The baker's oven happened at the moment to be properly heated, and the Kaeed, without any further trial, ordered the culprit to be immediately thrown into it. Hammooda having heard of this remonstrated with the Kaeed on his precipitancy, when he answered, 'I have done great good—bakers will in future deem it preferable to heat their ovens for bread of a proper weight, than for themselves, or whatever weight they may chance to be.'—*Excursions in the Mediterranean.*

## SHROPSHIRE ASSIZES.

## WARRANTY OF SEEDS.

PIERCE V. HEATH.

An action to recover the value of six bags of hempseed, supplied by the defendant's London factors to the plaintiff, under a warranty of being "new" seed; but which, on being sown, never grew, and was alleged to be old, and useless for the purpose of sowing.

Mr. J. Hitchin received a note from his nephew, the plaintiff (residing near Newport), desiring witness to purchase a quantity of hempseed from Mr. Heath. Mr. Heath said he had none, but would write to London and get some. Witness desired him to order the seed, which was to be delivered at Prior's Lee, and was so delivered. [A letter from defendant's agents, warranting the seed to be new, was here read.]

Joseph Jenks, servant to plaintiff, sowed the hempseed on the 19th of May, the day after it arrived. The field in which it was sown, upwards of five acres, was well prepared for it, but not a blade of hemp came up. The weather was very dry; but a quantity of clover sown with the hempseed came up very well.

Mr. Clay has been in the habit of growing and purchasing hempseed: saw this field before it was sown, and found it very properly prepared; it was worth 5l an acre; went to look at the field after the seed was sown, and took up a good deal of it; the seed ought to have sprung in five days, but not one blade came in a month. Can safely swear the seed was not new; it was old and very bad. Even when sown in June, hempseed ought to spring well.

Sarah Light examined the seed, and found it old and worthless. Sowed some of it in a flower-pot, and watered it, but not a blade came up.

Mr. Wm. Liddle, solicitor, proved the defendant's admission that he was indemnified as to the result of this action by his London factors.

For the defence Mr. Andrew Andrews was called, who for many years was in the employ of Messrs. Ambridge and West, seedsmen, of London. The seed supplied to plaintiff was new, and as fine as ever was seen; and would have grown if it had been earlier sown. It was foreign seed.

Mr. Bidwell sent off the seed on 13th May, and never saw finer. It was new seed, full of oil and meal.

The Judge thought as the warranty was proved, the jury had only to decide upon the conflicting evidence.

Verdict for plaintiff—Damages 25l.

## HOME CIRCUIT.—LEWES.

BARRON V. THE EARL OF ASHBURNHAM.

This was an action for a breach of contract.

Mr. PLATT and Mr. CLARKSON conducted the plaintiff's case; Mr. LONG and Mr. DAREY the defendant's.

Mr. Barron rented a farm of the Earl of Ashburnham, and, prior to entering upon his tenancy, made an agreement with the steward of his lordship, that as he did not keep a dog or carry a gun, the keepers should, when required, kill the rabbits and game that might do an injury to the wheat, &c. It was alleged that there had been a breach of the contract, inasmuch as the keepers had not destroyed the rabbits and game when required, and that a severe loss had been sustained in consequence.

For the defence it was contended that there had been no breach, as the keepers had always destroyed the rabbits and game when sent for, and had, in fact,

killed a great number. The loss sustained in the wheat was attributed to the improper manner in which the land had been sown and cultivated. There were a great many witnesses called on both sides.

The Jury returned a verdict for the plaintiff.—Damages Eight Pounds.

### NORTHERN CIRCUIT.

#### KILLING A HORSE BY ADMINISTERING AN IMPROPER MEDICINE.

STABLES v. RHODES.

Counsel for the plaintiff, Mr. Serjeant ATCHERLEY and Mr. WIGHTMAN; for the defendant, Mr. ALEXANDER and Mr. ADDISON.

The plaintiff, Mr. John Stables, was a solicitor in Leeds—the defendant was a chemist and druggist, residing in the same town. The plaintiff alleged that the defendant, being a person in the habit of making up medicines for horses, had prepared one for him of so dangerous and violent a nature as to occasion the death of his horse, and the action was brought to recover the value of it. It was a fact, not much disputed in the cause, that the death of the horse had been occasioned by the administration of that medicine. The case set up by the defendant was, that the ball was made conformably to the prescription of the plaintiff, who directed that a ball should be prepared, consisting of eight drachms of Barbadoes aloes, and one drachm of calomel, and that the defendant told him that it was a very powerful medicine, and should not be used except by a person who understood the nature of horses. This the plaintiff denied, and insisted that he had given no direction as to what the ball should be composed of, but left it to the judgment of the defendant. The evidence on the case was of the most conflicting nature. A friend of the plaintiff, who went with him to the defendant's shop, stated that the order was given without any specification of what ingredients the ball was to be composed, but he would not venture to swear that such an order might not have been given; and a young man, apprentice with the defendant, stated that he gave particular instructions as to the nature and quantity of the ingredients of which the medicinal ball was to be composed, and the caution given by the defendant as to its violent and powerful nature.

Mr. Baron PARKE said if the medicine had been prepared according to the instructions of the plaintiff, it was quite clear that he could not recover in this action; and his Lordship intimated that, as the witness for the plaintiff had only stated that he did not hear that which the witness for the defendant positively swore had taken place, he thought the Jury would have little hesitation as to their decision.

Mr. Serjeant ATCHERLEY claimed, with some little warmth, the right of reply.

The Jury, after hearing this and the charge of the Learned Judge, found a verdict for the defendant.

### ASSIZES.—KINGSTON, APRIL 4.

#### THE EPSOM RACE COURSE.

BRISCOE v. ROBERTS.

This was an action of trespass. The question at issue was the right of the plaintiff, John Ivatt Briscoe, Esq., the late Member for this county, to the title of the Lord of the Manor over the Epsom Race Downs. The defendant, a tradesman and inhabitant of Epsom, claimed a right in his character of an in-

habitant of Epsom to hold races and erect booths on the Downs at all seasonable times of the year.

Mr. THESSIGER addressed the Jury, and observed that it had been said that the plaintiff had been actuated by a desire to put an end to the Epsom races. He disclaimed any such intention; his sole motive was to protect his own rights, and the rights of those who would succeed him, against the claims of a body of men who had no pretensions for making them. Mr. Briscoe married a daughter of the late Sir Joseph Morbey, who, in the year 1771, became the purchaser of the manor of Epsom. In ancient times the manor belonged to the Abbey of Chertsey, but in the reign of Henry VIII. it was separated from it, and passed into the possession of Sir Nicholas Carew, who was afterwards attainted in the same reign. In the reigns of Mary and Elizabeth several grants of it were made, and ultimately it came into the possession of Sir Joseph Morbey, under whom, in right of his wife, Mr. Briscoe deduced his title. In the year 1815 a portion of the soil was leased to a Mr. Saunders, and in November, 1828, a portion was also leased to a Mr. Bluck, who erected the building called the Grand Stand, and he always paid ground rent to the Lord of the Manor. Two or three years since some parties, inhabitants of Epsom, formed themselves into a committee, and called it the Racing Committee, and took upon themselves the right of letting out the land during the races to any person who might be the highest bidder. They claimed the right as inhabitants of Epsom, from a usage of sixty years, to hold races, and erect booths, on the "Downs during seasonable times of the year." Mr. Roberts, who is an inhabitant of Epsom, rented some ground of the committee during the races in May and October, and paid the sum of five hundred guineas. He proceeded last year to erect booths preparatory to the races, and Mr. Briscoe, determined to try the right, desired his bailiff to serve him with a notice not to make the erection.

After the production of documentary evidence to prove the plaintiff's title, witnesses were called to prove having attended the races for a number of years, and having always paid ground rent to the different collectors, who told them that the money was collected for the Lord of the Manor, Sir Joseph Morbey.

Mr. PLATT addressed the Jury for the defendant.—He said, he defended this action on three grounds—1st. That the soil and freehold were not in Mr. Briscoe but in Baron de Tessier, a gentleman of property, residing at Woodcot Park, in this county. 2dly. That the defendant had leave and license to erect the booths; and 3dly., That the inhabitants of Epsom had a prescriptive right to hold races and erect booths at all seasonable times of the year. He would adduce evidence in support of those pleas, and then they would have to determine whether the plaintiff should have it in his power to discontinue a great public amusement or not.

Certain documentary evidence was then put in to prove Baron de Tessier's claim to the soil, but it appeared that the Baron had only an easement in the land, a sheep walk for four hundred sheep; the plea was therefore abandoned.

Witnesses were also called to prove that they had attended the races for a long period, and had paid rent to the collectors, who invariably told them the money was applied for the purposes of the Course. The witnesses on either side who gave the forgoing testimony were principally a class of persons called travellers, who keep booths for refreshments, &c. at races and fairs.

The Jury after a short deliberation returned a verdict for the plaintiff—Damages 5*l*.

## PARING AND BURNING.

BY MR. RICHARD MINCHIN, HAZLETON, GLOUCESTERSHIRE.

(From *Baxter's Library of Agriculture*.)

This system of culture consists in paring off the grassy sward or surface of the land, with an instrument called a breastplough, to the depth of from half an inch to an inch, and the turf or sward pared off being burnt, the ashes obtained have, under a good rotation of crops, produced one of the cheapest and most profitable of manures.

This method of culture appears to have been very anciently practised : it may be inferred from Virgil, that its beneficial effects were as well known and as highly appreciated by the Romans in his time, as they are now by the English farmer ; but whether it perished with other arts and sciences with the ruin of the Roman empire, or whether it struggled for an obscure existence with the barbarisms of the middle ages, cannot now perhaps be ascertained ; the probability, however, is, that it has never been entirely discontinued ; for although the chemical properties of soils might have been unknown, combustion offered so ready a means of effectually destroying weeds, and to facilitate in breaking up old pastures, that to embrace an advantage so desirable could scarcely be omitted by the agriculturist in the lowest state of his art.

*Paring and burning*, however, has been but a few years generally practised in any part of this kingdom ; and it was but little practised, till within the last sixty years, on the Cotswolds in Gloucestershire, where now, with the adjoining parts of Oxfordshire, it is so extensively and, upon some lands, so uniformly adopted, that it has become a striking feature in the rural economy of that district.

It appears to have been used at first only occasionally in the bringing of sainfoin leys into tillage : the sainfoin was kept down for a great length of time, frequently from ten to fifteen years ; the sward, of course, was become thick and strong, and their method of breaking it up was of the most rude and troublesome description. They ploughed the sward up deep with the horse plough, some time during the winter, and sowed it with oats in the spring ; but as neither drags nor harrows would make much impression on such tough furrows, the crops were very scanty. The next year the land was ploughed again, and again sown with oats ; the ensuing year they had a summer fallow, and then cleaned it as they best could ; applying the little manure they could command, they then planted it with wheat, or, which was not then very common, with turnips. To subdue this tough sward, paring and burning was a striking improvement ; it being taken off and burnt, the after-culture became comparatively easy ; the dressing of the ashes produced generally a plentiful crop of turnips, which was followed almost of course with a good crop of barley, and a luxuriant crop of clover.

But from paring and burning being expensive, and money being scarce, and old habits not easily removed, it was twenty or thirty years before the old practice could be quite exploded, and the paring and burning universally adopted, which was still confined to the sainfoin leys. The high price of grain, however, induced people to bring enclosures and old down pastures into tillage, and they were not slow to avail themselves of a practice so highly beneficial as that adopted with the sainfoin leys ; and perhaps in

no one instance have old pastures on the Cotswolds been brought into tillage without the agency of the breastplough.

The greatest part of these soils were of the lowest quality, but from having been down a great number of years, and from the plentiful dressing of ashes, the most sanguine expectation of the cultivator was realized in the abundant crops produced. Notwithstanding these manifest advantages, prejudices were soon raised ; the land, for the want of a good rotation of crops, became exhausted, which gave rise to an opinion that those advantages were acquired at the expense of the future fertility of the soil ; in short, that the soil would be burnt up, and eventually become worthless. This idea had at one time possessed the landed proprietors so forcibly, that many of them introduced a clause in their leases prohibiting the practice altogether.

Although some proprietors prohibited their tenants from paring and burning, others did not ; and it was soon discerned that those who practiced it had a great advantage over those who did not ; the poorest and most exhausted downs, when the rye grass and clover leys were burnt for wheat, showed symptoms of returning fertility. Imperfect as the rotation of crops at this time was, these strong evidences in its favour became more apparent ; as the system of cropping was improved, opposition gradually became less, and has long since altogether ceased.

From the sainfoin leys and down pastures the system was soon extended to almost every kind of soil, and almost every kind of crop, with various success, and perhaps in a very few instances without advantage ; but the most complete triumph of this singular species of husbandry is, that after a regular succession of cropping for a long series of years, without the aid of any other manure than the ashes afforded by paring and burning, the land, so far from being deteriorated, has become visibly improved. It will therefore be requisite to give the best practice for the various soils, to facilitate which, it will be advisable to divide the subject into the following heads :—

- i. A description of the various soils on which paring and burning has been performed with advantage.
- ii. The method of performance.
- iii. Rotation of crops.
- iv. Concluding observations.

#### i. A DESCRIPTION OF THE VARIOUS SOILS ON WHICH PARING AND BURNING HAS BEEN PERFORMED WITH ADVANTAGE.

It would be difficult to determine, with anything like precision, on what soil paring and burning has been used to the greatest advantage ; therefore it may not be amiss to take a review of its effects on the various soils ; for this purpose it will be requisite to make the following subdivision :

##### 1. *Peat*, or soil on which vegetable matter forms the whole or principal part.

This consists chiefly of drained bogs and other lands which have been wet, and is sometimes of an extraordinary depth. Paring and burning seems to be entirely adapted to this soil ; it is easily ploughed with the breastplough, and when burnt produces a great quantity of ashes, generally black and soft, which are considered the best, which act not only as a manure on this soil, it being very light and prone to throw up the plants, but from the ashes being much heavier than the soil, contributes to make it much more firm, and causes the plants to root more

strongly. Dr. James Anderson, in his ingenious and useful essays on agriculture, after speaking of paring and burning generally in terms of high commendation, particularly excepts peaty soil, and says, 'that on this it can be nothing but injurious.' The experience derived from practice of late years is completely at variance with this opinion.

2. *Mixed soils*, but where vegetable matter predominates.

The same effects are produced from paring and burning on this soil as on the peaty soils, but to a less extent; and it may perhaps be taken as a rule, that where vegetable matter most prevails, the benefit derived from this system of culture is the greatest. In soils where earths are pretty regularly mixed, there appears little reason to expect any greater advantage to arise from paring and burning on this soil, than that of speedily converting vegetable matter into an active manure, as it neither wants to be made more heavy nor more friable. It is, notwithstanding, extensively practised, and it is supposed to possess considerable advantage; for if paring and burning of the grasses and fibrous roots, which have accumulated upon the land, affords a ready means of procuring a manure that will produce a good crop of turnips, which crop will generally ensure all the succeeding crops good, how can this practice then be otherwise than advantageous?

3. *Clayey soils*.—These have been less attended to in this matter than either of the soils previously noticed. The *breastploughing* or *paring* is more expensive, and the burning is attended with more risk and uncertainty, on account of the great length of time which is required for drying the turf; the ashes are supposed to be inferior to those before named; the land cannot be breastploughed in dry weather; and if it has been trodden with cattle after the frost is over, it cannot be breastploughed at all. These obstacles seem to be sufficiently formidable; yet it has been performed, and with eminent success; the difference in expense is only a few shillings per acre, and the ashes are certainly good; and it must not be considered proved that their quality is inferior to the ashes of other soils. To this, however, more immediate attention will be paid when treating on the rotation of crops.

There is also an advantage attending this system of husbandry on clayey soils which should not pass unobserved, as it will compensate for much expense and trouble in the operation,—and this is, the permanent improvement it makes in the nature and the staple of the soil, independent of the manure which it affords; the quantity of ashes produced by continually paring and burning will not only, by mixing with the clay, make it more friable, but, on account of their specific gravity being greater than that of soil, work to the bottom of the furrow, and thus form a gritty subsoil, which greatly facilitates the ploughing and the working of the land, making at the same time a dry and healthy bed for the growth of the plants: hence the plants never turn sick and yellow from wet, on burnt lands, as they do on lands that have not been burnt.

4. *Sands*.—Sandy soils have been pared and burnt still less than those of clay; the breastploughing on these soils is easy, but the burning is rather troublesome, on account of the sand running, which frequently puts out the fire; neither is it benefited by the mechanical action of the ashes, as in the case of clay and peat. It has, however, been used advantageously in cleaning foul lands of this description; and although Sir

Humphry Davy's opinion is entirely opposed to paring and burning on light poor sands, yet, until it has been tried under the best rotation of crops, which will be hereafter pointed out, it would be premature to condemn it altogether.

## ii. METHOD OF PERFORMANCE.

It has already been noticed that paring and burning consists in paring off the grassy sward or surface of the land with an instrument called a breastplough, and as the success of this system of culture greatly depends on the manner in which it is performed, it will be necessary to enter into the following detail for the information of those who are entirely unacquainted with it.

1. *Breastploughing*.—Sainfoin leys, old pastures, and all pastures and foul lands are easily brought into culture by the use of the breastplough, by which means the surface of the land is taken off, from half an inch to an inch. The time of performance varies with the soil and the crop it is to precede; the greater part, however, is performed some time between the first of January and the first of August. The turf must remain until the mould, which is turned uppermost by the breastplough at the time of paring, is quite dry; it is then dragged or harrowed repeatedly, until it is sufficiently dry for burning.

2. *Burning*.—For this purpose, it is all raked together into convenient heaps, and set on fire with a little straw, which requires good attention until the heaps are well lighted; they will then all burn out excepting a little turf on the outside, which should be raked together into fresh heaps and burnt.

3. *Spreading the ashes*.—The heaps, after being well burnt, should remain some time before they are opened, at any rate till they are well cooled and damped by the earth and dews; and it is far the best to have rain on them first, for if they are opened hot, or spread when too dry, the wind, if at all brisk, will carry a great quantity of the most valuable part away; care should also be taken at the time of spreading, that the spots on which the heaps are burnt are well cleared, and that the ashes are regularly spread over the ground, and if dung be added, it must be laid on the ashes, and the ashes and dung ploughed in together.

4. *Ploughing previous to sowing the seed*.—It is absolutely requisite that burnt lands should be ploughed as lightly as possible, for should this point be neglected, the paring and burning will scarcely amount to any other than labour lost; it may indeed assist in cleaning foul land, but as a manure it will be of little or no service. The ashes should be concentrated and kept as much as possible together to act effectually, whereas, in deep ploughing, they are dispersed, and their action on the plant is either lost, or much weakened. To effect this it should be first *risbawlked*; this term is well understood on the *Cotswolds*; but as it may not be generally known, and as frequent use will be made of it, the following explanation may be required:—*Risbawlk* is a method of ploughing by which a narrow rib of unploughed land is left between each furrow, which rib cannot be too narrow. Those who are unacquainted with this description of ploughing, may not be easily persuaded of the propriety of ploughing one part, and leaving the other part unploughed; a little experience, however, would soon convince them, as there is no method by which the whole surface of the ground can be so completely broken at a depth equally shallow. To state at what depth burnt lands should be *risbawlked* would be to little purpose, as it cannot be done on all land at the

same depth ; it is however often done at two inches, and, if possible, should not exceed at any time two inches and a half. After the *risbaults* have lain a short time they should be harrowed down ; and if the surface of the land is well broken, it may, at the proper time, be cleaned, ploughed, and the seed sown, but if the surface of the land be not well broken, it should have a second *risbault*, which must remain, of course, a short time, and be afterwards clean ploughed, but not to have more than one clean ploughing if it can be possibly avoided ; care should also be taken that the ploughings across each other should be done in a proper manner, otherwise the plough will jump from rib to rib, and cause a very disagreeable jerking. Some lands, from being thrown up in ridges, and from other causes, cannot be *risbaulted* ; these should, therefore, be ploughed as shallow as possible, and the seed sown as soon as in a proper state.

5. *The cost of paring, burning, and spreading the ashes.*—This varies according to the nature of the soil, &c. from ten to thirty shillings per acre ; the greater part however, by far, where plenty of *breastploughers* are to be had, is done at from fourteen to twenty shillings, but when it is first introduced into a district, it is probable it would be more expensive.

### 3. ROTATION OF CROPS.

The rotation of crops, under which it will be necessary to carry on the system of *paring and burning* with success, is of so much importance as to require the most minute attention even at the risk of being tedious. It may be used, certainly, under any rotation to which it is applicable when the land is of a good quality and pretty well supplied with dung ; but when ashes is the only or principal manure, the case is quite different.

#### 1. *Mixed soils of pretty good quality.*

ROTATION.—The *first year*, turnips ; *second year*, barley, among which seeds are sown and kept down ; *third and fourth years*, seeds which are pared and burnt some time before the end of July in the *fourth year*, and sown at the proper time for *fifth year*, with wheat ; *sixth year*, oats, with which a cheap rye-grass is usually sown, and pared and burnt the following spring for *seventh year* turnips.

This rotation may be used to advantage when a little dung can be added to the ashes, but not otherwise ; for unless a dressing of manure can be added to the ashes, no good farmer would take two white corn crops in succession. The seeds are fed off (very lightly) in the autumn, after sown among the barley, and are generally once mown the first year, and afterwards fed off by sheep. By this course the land will in six years bear.

|              |   |            |
|--------------|---|------------|
| Wheat once   | } | Six years. |
| Barley once  |   |            |
| Oats once    |   |            |
| Turnips once |   |            |
| Seeds twice  |   |            |

#### 2. *Peaty, or mixed soils of an inferior quality, or when dung cannot be added.*

ROTATION 1.—*First year*, turnips ; *second year*, barley, among which seeds are sown, and kept down ; *third and fourth year*, seeds, and pared and burnt as above for *fifth year*, wheat ; and *sixth year*, turnips, for which the wheat stubble is pared and burnt, which will produce in five years,

|              |   |             |
|--------------|---|-------------|
| Wheat once   | } | Five years. |
| Barley once  |   |             |
| Turnips once |   |             |
| Seeds twice  |   |             |

This is a good course if the wheat stubble can be

depended on to produce grass enough to furnish a sufficient dressing of ashes ; and this is frequently the case ; for if the land be clean and in a good condition, it will, towards the latter end of April, or the beginning of May, be covered with a fine soft grass ; this should be pared off clean, and burnt as quick as possible ; the land may then be very lightly ploughed, by giving it first a *risbault*, as described in the method of performance, and the turnips sown as soon as it is sufficiently moist. Very good crops have been grown in this way ; but if there is reason to expect the wheat stubble will not be sufficiently grassy, the following course is most to be relied on.

ROTATION 2.—*First year*, turnips ; *second year*, barley ; *third and fourth year*, seeds, sown, kept down, and pared and burnt as before ; *fifth year*, wheat, with which seeds are sown to stand ; *sixth year*, seeds, which are fed off by sheep, and pared and burnt the following spring ; for *seventh year*, turnips, which in six years stands thus :—

|              |   |            |
|--------------|---|------------|
| Wheat once   | } | Six years. |
| Barley once  |   |            |
| Turnips once |   |            |
| Seeds thrice |   |            |

This course will keep land in good condition for any length of time, without the aid of any other manure than that which is left on the land by the sheep, in feeding off the turnips and the grass crops.

I have land on my farm at Hazleton, which has been in regular cultivation for nearly thirty years, without any other manure at any time whatever than that afforded by the sheep in feeding off the turnips and seeds, and it has been pared and burnt invariably for wheat and turnips.

#### 3. *Poor down lands, or other poor soils on which wheat cannot be grown to profit.*

ROTATION.—*First year*, turnips ; *second year*, barley or oats, among which seeds are sown and kept down ; *third, fourth, and fifth years*, seeds, and pared and burnt the following spring for *sixth year* turnips, which in five years will stand as follows :—

|                     |   |             |
|---------------------|---|-------------|
| Barley or oats once | } | Five years. |
| Turnips once        |   |             |
| Seeds thrice        |   |             |

Under this system extreme poor lands may be kept in culture to considerable advantage ; it is not recommended, however, that the seeds should be kept down longer than they continue to carry a good plant.

#### 4. *Clayey Soils.*

When a farm consists wholly of clay, turnips may be inadmissible, consequently this system of husbandry perhaps is altogether inapplicable ; but when the clay bears a small proportion to the whole quantity of arable land, paring and burning may be practised perhaps with as great advantage as under any of the circumstances that have been noticed ; for this purpose the clay land should be divided in equal proportions, that one part may be sown with turnips every year, which may be fed off by sheep early in the autumn, and then, as soon as the frost has mellowed the soil, it should be breastploughed, which should lie until the proper time to plough for the sowing of the barley or oats. When the pasture, rye grass or clover ley is intended for wheat, the paring and burning must be carried on in the spring, and lie all the summer in a state of unprofitable fallow, which, with some persons, is a considerable objection ; this, therefore, may be obviated by paring and burning only for turnips, and sowing wheat as soon as possible after the turnips are off.

ROTATION 1.—*First year*, turnips ; *second year*, bar-

ley or oats, among which seeds are sown and kept down; *third and fourth years*, seeds, and pared and burnt the following spring for *fifth year* turnips; *sixth year*, wheat, among which seeds are sown and kept down; *seventh year*, seeds, and pared and burnt for *eighth year* turnips, which stand in seven years thus:—

|                     |   |              |
|---------------------|---|--------------|
| Wheat once          | } | Seven years. |
| Barley or oats once |   |              |
| Turnips twice       |   |              |
| Seeds thrice        |   |              |

The stubbles may be pared at any time of the year if they have not been trodden by cattle, and the drier the better.

If a summer fallow, which may not perhaps be objected to by some farmers, the following course must be pursued:—

ROTATION 2.—*First year*, turnips; *second year*, barley or oats, among which seeds are sown and kept down; *third and fourth years*, seeds, and pared and burnt the following spring, and lie, *fifth year*, summer fallow; *sixth year*, wheat, among which seeds are sown and kept down; *seventh year*, seeds, and pared and burnt as before for *eighth year* turnips, which in seven years stands as follows:—

|                     |   |              |
|---------------------|---|--------------|
| Wheat once          | } | Seven years. |
| Barley or oats once |   |              |
| Turnips once        |   |              |
| Seeds thrice        |   |              |
| Summer fallow once  |   |              |

It has been already slightly noticed, that by some persons the ashes on clayey soils are supposed to be inferior to those on other soils. This supposition took rise principally from the following curious idea,—that, when the ashes are red and brick-like, they are bad;—when they are black and soft, they are good. Popular as this opinion is, it is not borne out by experience; for no farmer, perhaps, has been able to observe the least difference in his crops, even if patches of each were interspersed about the same field. The redness or blackness of the ashes is caused partly from circumstances connected with the operation of *paring and burning*, and partly from the nature of the soil; for, if the land be wet at the time of *paring*, and the sod *burnt* before it has become sufficiently mellow by changes of weather, the ashes will be red: the same effect will also be produced, if, at the time of burning, the wind be rough, and the turf burns too rapid, and the stiffer the soil, the greater the redness and coarseness of the ashes.

The introduction of sainfoin has been avoided in giving the above rotations; but where land is adapted to its growth, it will, of course, form part of the rotation. A mixture of grasses suitable to the soil may also be used to very great advantage.

#### 4. CONCLUDING OBSERVATIONS.

From the above account it will be easily perceived that a large proportion of the land in Great Britain might be materially benefited by the process of *paring and burning*, which, so far from destroying the soil, not only mechanically acts greatly to its improvement, but changes dead, inert, and useless substances into a manure, highly conducive to the growth of the cultivated crops; the effect of which may be seen in the turnips and clover more particularly, it being a manure in which they seem especially to delight.

It will also be perceived that it cannot be extensively nor successfully pursued only from *attention being paid to the method of performance*, and to the *ameliorating crops with which it is associated*. Those who contend that the soil will be injured by burning, in consequence of the principal part of the vegetable

matter being dissipated, appear to overlook the reproduction of that matter by a proper system of cropping.

There is also a mechanical action produced from burning, which should not be omitted—that is, *if the land be dry at the time of burning*, every spot where the heaps were formed and burnt will produce a much more luxuriant crop than those parts where the ashes were only spread—so much so, that it will appear in patches of nearly a foot higher in growth all over the field. This has been noticed in particular on peaty soils, although the peat has ignited and burnt to the depth of three feet below the surface of the soil. Surely this practical fact will then induce scientific part of the agricultural community to pay greater attention to this much neglected, although valuable system of culture, and point out the ratio of action by which the land is kept thus productive, at an expense far less than any other manure could be obtained.

The system of *paring and burning* is equally worthy the attention of government as it is of *individual proprietors*, on account of the ready method it offers of bringing waste lands and inferior pastures into immediate and profitable cultivation, and of keeping them in that state. Why these lands and inferior pastures still exist to disgrace and impoverish the country in these days of agricultural science it is difficult to account; for they afford neither profit to the owner, nor employment to the peasant. But of what value is the introduction and culture of the turnip to those who have predetermined that none shall grow on their land? and of what value are the cultivated grasses to those who are satisfied with the scanty supply of spurious grasses which may be collected amidst the *furze, fern, and moss* on their grounds? These are, it is true, clean to walk upon and soft to ride upon; and if they have bushes, they are pleasant to look at; but as for any useful purpose to the community, they are little better than lost. To the statesman and the patriot, this consideration will probably suggest itself—whether these waste lands and inferior pastures might not have afforded profitable employment for those persons whom of late it has been thought advisable to export, to produce the grain which has in the same time been imported?

SPRING SALAD.—We know of nothing more grateful to the palate than a fresh gathered spring salad, more particularly when dressed after the Parisian manner. In this department our Gallic neighbours have altogether eclipsed us. We have often partaken of an exquisitely dressed salad, at a *restaurant*, in the Palais Royale, the only drawback to our enjoyment being the reflection that we could not obtain such a luxury upon our return to our own metropolis. The secret has, however, been at length discovered, and we challenge the most skillful disciple of Dr. Kitchener himself, to distinguish between a real French salad and a genuine English one, when dressed with “CROSSE and BLACKWELL'S FLORENCE CREAM.” It is equally delicious with lobsters and shell-fish, and enables a salad to be prepared in one minute. In the country, where the necessary materials for preparing a good mixture cannot readily be obtained, it will be found invaluable.

Whoever would enjoy a steak, chop, fish or game in perfection, should use CROSSE and BLACKWELL'S SOHO SAUCE. The rich and piquant flavour which it possesses, being at the same time free from anything predominant, is an excellent attribute of a good sauce.

## RUTLAND AGRICULTURAL SOCIETY.

The Spring Meeting of this Society (for the show of cart stallions) was held on Monday, the 6th of April, in the riding house, Oakham: the attendance of horses was large, many having come from different counties to compete for the liberal premium offered; to the best cart stallion that shall attend at Oakham once a week during the season of 1835.

The premium was awarded to Mr. Daniel Housin's horse, Oxford, and Mr. Billing's horse allowed to be the second, and succeeding horse, in case the winner should neglect the restrictions laid down by the society. The judges, — Wright, Esq., of Alstead, Leicestershire, and Clarke Morris, Esq., of Oakham Grange, Rutland, also commended the following:—

Mr. Valentine Stapleton's chesnut horse; Mr. Berridge's black horse; R. W. Baker, Esq.'s., Suffolk horse, Rutland Plough-boy;—and Mr. King's black horse: all of which were of a superior kind. Several others were shown in addition to the above. After the business of the day was gone through, a large party dined together at the Crown Inn, John Painter, Esq., in the chair.

It is an important fact to state that the premiums of the above society for the present year, 1835, amounts to no less than *one hundred and fifty pounds*; there are three classes open to all England, namely, class 1, 7, 11, under certain conditions, contained in the society's bill of 1835, which may be obtained by any person applying to the Secretaries, at Oakham, Rutland, on or before the 16th of November 1835, the day all certificates are required to be sent in.—Class 1, for oxen or steers of any breed or weight, under five years old, without restriction as to feeding; a premium of 15 sovereigns to the best. Second best, ditto, 7 sovereigns.—Class 7, for long woolled fat wether sheep, one year old, without restriction as to feeding. To the best pen of three under 22 months old, a premium of 7 sovereigns. To the second best, ditto, 3 sovereigns.—Class 11, for pigs of any breed or age, weight above twenty stone. To the best fat pig, a premium of 5 sovereigns. To the second best, ditto, 2 sovereigns. The following sweepstakes are also open to all England, which close on the 16th November 1835:—

A sweepstakes of two sovereigns, for the best beast, of any breed, age, or weight. A sweepstakes of one sovereign, for the best pen of three sheep, of any kind, breed, or age. A sweepstakes of one sovereign for the best sheep, of any kind, breed, or age. A sweepstakes of one sovereign, for the best pen of 5 breeding ewes, of any breed or age, that have suckled lambs up to the 1st July, 1835; and that have been fed on grass and seeds only, for six months previous to the time of showing.

## AGRICULTURAL MEETING AND CATTLE SHOW AT KELSO.

On Tuesday, March 31, the Union Agricultural Society held their annual show of stock, and sale of short-horns, at Kelso, when the quantity of stock brought forward was even more numerous than heretofore. In the department of short-horned bulls

alone, nearly fifty animals were shown for competition and for sale, a great proportion of which appeared to be brought to the highest pitch of excellence of which the breed is susceptible. In cows and queys, the show was also unusually large, particularly in the latter, many of which we understand also met with a ready market, at very encouraging prices. Indeed, at none of the previous exhibitions has the show of queys been either so numerous or of such superior description in point of quality. The show of sheep, considering that this is not the season when that kind of stock is usually exhibited, was, though not large, highly respectable, especially in Leicesters, several of the pens for which were occupied by very superior animals; the number of Cheviot sheep brought forward was smaller than that of the Leicesters, but the judges considered those shown to be of very excellent quality. In the department of extra stock, his Grace the Duke of Buccleugh exhibited a pen of five Dorsetshire ewes and lambs, from Bowhill, which were much admired. Of draught stallions, more than twenty were exhibited, many from Lanark and Stirlingshire. Some of them were splendid horses, and the judges must have been a good deal puzzled in making a selection of those on which to bestow the Society's premiums. The exhibition lasted from between ten and eleven o'clock in the forenoon till about half-past three, and during that period, several county gentlemen, and a great number of eminent breeders and agriculturists from both sides of the Border, were in attendance. At four o'clock, a party of upwards of eighty members and friends of the Society, with several of the gentlemen from a distance, who had attended as purchasers in the show-yard, sat down to dinner in the White Swan Inn; George Baillie, Esq., younger, of Jerviswoode, one of the Vice-Presidents of the Society, in the chair, supported on the right by his Grace the Duke of Buccleugh, and on the left by Thomas Tod, Esq., of Drygrange. Henry F. Scott, Esq., younger, of Harden, another of the Vice-Presidents, officiated as croupier. A great number of toasts, suited to the occasion, were given and prefaced by the chairman, in eloquent and spirited addresses, and the whole business of the evening was conducted with that ability, kindly feeling, and good humour for which Mr. Baillie stands pre-eminently distinguished, and which never fail to inspire a company over which he presides with the utmost enthusiasm. Another great source of delight to the meeting was the presence of his Grace the Duke of Buccleugh, the Union Society's most munificent supporter, and the patron of every institution having for its object the improvement of the country, and the welfare and prosperity of its inhabitants. The health of the noble duke was received with the most rapturous plaudits, and, in returning thanks, his Grace alluded to the high compliment which was lately paid to him by the tenantry of the Lothians, and expressed the delight which he always experienced, when it was in his power to be present at such meetings, and in such company as he then saw around him. The evening was spent in the most joyous and delightful manner.

## DOMESTIC SERVANTS.

MR. EDITOR,—Allow me to draw your attention and that of the public to a matter of universal interest, viz., DOMESTIC SERVANTS.

As the time for re-hiring is at hand, it has occurred to me that an hour spent in suggesting a few hints as to the causes of the ill conduct of many among that class, and as to what may tend

to their improvement, would be a service both to the heads of families and ultimately to themselves.

In the first place it strikes me as a most glaring anomaly, that amidst the vast depreciation which has taken place in the last fifteen or twenty years in the value of all sorts of property and produce, that domestic labour should have retained if not advanced on the war price! Is it not a fact that all articles of consumption, among female servants in particular, are nearly fifty per cent. cheaper than during the war? Now, in regulating the price of wages to the *out-door labourer*, regard is always had to the prices of articles of consumption; is there anything in their peculiar condition why the same rule should not regulate the wages of in-door servants?

But though in times like these, when from a great depreciation in the value of property, all, from the Peer to the lowest tradesman or agriculturist, are bitterly complaining of the burden of the outgoing payments necessary to the station of life they occupy, this would be justification enough for the burdened party *to make one common effort to unburden itself*; yet I think this not the only, nor even the chief reason why we ought all to resolve on a proportionate decrease in the wages of our servants. I more particularly confine my remarks to female servants. It is obvious that the class in general must, from their origin, be ignorant, and from their age, have but little experience and less discretion; at the same time they are for the most part young, and of that age when their passions are most likely, if there be any external cause to give a bias, to warp them from what little discretion they may have into a channel neither favourable to *virtue nor domestic usefulness*.

That external cause is, I fear, to be found in the extraordinary highness of wages. There are few tradesmen or farmers' daughters having no other dependence, who think they can afford to put upon their backs clothing to the same amount as an ordinary servant can, who is in a family of middle rank. The consequence is, that servants are now *eaten out with pride*. Ask any farmer's wife in the country whether the servants are not all getting above their work? In short many respectable yeomen have expressed to me their apprehensions that *no servants will be found for farm houses!*

Besides, the vanity of mind induced by dress, produces that *fickleness of disposition*, which is the great cause why they are so little anxious to retain their places for any length of time. Many a servant now thinks nothing of changing her place twice or even thrice a year! The evil to which this leads is very great—it makes servants *indifferent to character*—nay, it tends to *do away with the practice of obtaining characters*—for what is the value of a character of three or four months standing?—but what is worse than all is, that it paves the way for destitution and misery to the young woman in after life: for as a rolling stone gathers no moss, so she, by such roving habits both fails to acquire that knowledge and experience which would qualify her for the office of a mother, when eventually she becomes one (which alas, is the case often, too soon, from the very cause I complain of), and to conciliate that esteem from her betters which is usually shown towards domestics, who

by retaining their places, have at length so won the esteem of their employers as to elicit some solid proof thereof on their entering the married life; or at least to know that should adverse circumstances hereafter make them objects of pity or compassion, they may rest assured in the cheerful sympathy and aid of their former master or mistress.

Who that is accustomed to visit the haunts of the poor in a way of sympathy, but must agree with me in saying that, except in a few instances (and these I find have been good servants), our cottages exhibit a scene of *utter improvidence, bad management, filth, and waste*? The weary husband comes home at night, but not to comfort, to cleanliness, and to peace, but to *lawless children—to an ill-cooked meal—to squalidness* induced by the wife's sudden transition from plenty to penury, and to *rags*, which she has, from former profusion, become habitually too indolent to repair! The moral effect of all this is dreadful! With the man *disgust* now usurps the place of attachment, and the beer shop with inviting placard, cheerful fire, and well dressed landlady (dressed well with the money that should clothe the labourer's wife), offer a way-side refuge too inviting for the labourer to pass by. What follows? The standing overseer will unfold one part of the sequel, the session or assize calendar the other!

I hope I have shewn (and I speak from personal observation) that the practical tendency of high wages to servants is unfavourable to domestic usefulness; to themselves and eventually to society at large. It appears also altogether anomalous that with an augmented population chiefly from this very class, and consequently we may say, with a glutted market—with the means of supplying themselves with clothing at almost half what it was, we should still be paying for their services an increased, increasing premium.

Reserving a few other observations for another communication, should you deem this worthy of insertion,

I remain, yours, &c.

OMNIUM AMICUS.

April 2.

#### A FRAGMENT.

Oh! tis' a precious gift, those young bright flowers  
So beautiful and fresh, the spring's rich boon  
To the rejoicing earth. They come to us  
Like messengers of gladness—do they not  
Speak to our hearts, of summer's splendid leaves—  
Of the rich scented rose—of hues more bright  
Than those which gild with light, the present hours?  
And the heart fondly clings to all that tells  
Of the mysterious future: we so love  
To chain our hope to days that are to come.  
These flowers too are the first that winter's storm  
Hath passed no blight on; their scented breath  
Has been but flung upon the milder breeze,  
And we feel too, that by their bursting forth  
From wintry dust, they are the blessed signs  
Of love and mercy, which have ever ruled  
This world, in seasons that have fled, and still  
Gives spring and flowers and gladness to the earth.

Kimbolton.

B. B. B.

## WEST CUMBERLAND AGRICULTURAL SOCIETY.

This Society held its Second Spring Show of Cattle at Cockermouth, on Monday, April 13. The Show which took place in a field near the Gas Works, was much inferior in point of number to that of last year, though the quality of the animals exhibited was of the highest excellence. Several of the smaller beasts were models of symmetry, and the larger cattle attracted much attention, and considerable speculation prevailed as to which would be declared superiors, the quality being so nearly alike that the opinions of even good judges in agriculture were divided.—There was a great number of bulls, but very few heifers shown, and the ground was cleared at an early hour.

The following are the awards of premiums made by the Judges:—

For the best short horned bull, 5*l*. to Mr. H. Salkeld, of Workington; second best, Mr. Wm. Raven, of Eaglesfield.

For the best long-horned bull, Mr. J. Robinson, of Wythop; the second prize would have been awarded to Mr. Blythe Atkinson, but as he got the prize last year, he was not allowed to receive it. For the third best, the prize was awarded to Mr. T. Briggs, of Redmain.

The head prize for the Galloway Bull was awarded to Mr. J. Blackburne, of Hayton Castle; for the second best 2*l*. to Mr. Wm. Cowen, of Kelside, Dovenby.

Four heifers showing no more than four broad teeth, for the best short-horned, 3*l*. to Mr. Wm. Thompson, of Ravenglas; second best, Mr. H. Salkfield, of Workington.

For the best long-horned heifer, 3*l*. to Mr. Joshua Robinson, of Wythop; for the second best, Mr. J. Adcock, of Blinderake.

For the best Galloway heifer, the prizes were awarded to Mr. A. Nichol, of Lindsfield.

For the best heifer with no more than two broad teeth, the best to Mr. Parkin, of Mealo; the second to Mr. W. Birkett, of Papcastle.

For the long-horned the head prize was given to Mr. J. Adcock; and the second to Mr. J. Robinson.

For the best Galloway heifer shewing no more than two broad teeth, the first and second were awarded to Mr. Nichol, who had no competitors.

For the best boar the prize was awarded to Mr. Joseph Dixon, of Wythop Mill; for the second, to Mr. Robert Shepherd, of Unerigg.

The Members' Prize was awarded to Mr. Wm. Birkett, of Papcastle.

For the Sweepstakes, the best short-horned heifer to Mr. Wybergh.

The head prize for the sow was awarded to Mr. John Drape, of Kinside Hill; the second best to Mr. J. Todd, of Gale.

After the show, a numerous party dined together at the Globe Inn. John Watson, Esq., of Clifton, in the Chair; and J. Benson, Esq., vice. Among the general company were Sir F. F. Vane, Bart., of Armthwaite Hall; Wm. Wybergh, Esq., of Isell; Jos. Harris, of Greysouthen; Rev. H. A. Hervey, of Bridekirk; the Rev. C. H. Wybergh, Isel Old Park; Richard Atkinson, Esq., of Bas-senthwaite; Jno. Peile, Esq., of Whitehaven; Henry Jefferson, Esq., Whitehaven, &c., &c.

The cloth being withdrawn, the CHAIRMAN gave "The King," which was drunk with three times three. "The Queen, and the rest of the royal family," was drunk with similar honours.

The CHAIRMAN proposed "Success to the West

Cumberland Agricultural Society," which was drunk with three times three and one cheer more.

The Secretary then read over the list of premiums, as given above.

"The health of the "Successful Candidates" was then given, and Mr. WYBERGH being called upon, returned thanks in a very appropriate manner, declaring that he should hand over his premium to the Secretary to be competed for at the next meeting. (*Cheers.*) In the course of his address, he remarked, that some difference of opinion prevailed among farmers as to the best kind of stock, but, for himself, he would say that he thought short-horned the best; indeed, he remarked, jocularly, that he thought that kind the most profitable, for he had very unexpectedly received 3*l* 10*s* that day. (*Laughter.*) He was only a late candidate in the field, and should not have thought of offering his beast for a prize, but on Saturday night, his farmer advised him to send up his small short-horned, which he complied with, and the result was very satisfactory. (*Cheers and laughter.*)

The next toasts were "The High Sheriff;" and "The Members for the County."

Mr. FELL, of Workington, then proposed the health of the Chairman, who returned thanks in a very neat address.

The CHAIRMAN next gave the health of the Judges of the Show, and thanks to them for their exertions, and for the impartial manner in which they had made their awards.

Mr. RIGG, of Abbey Holme, (one of the judges), was called upon, and returned thanks at some length. He regretted that the show had been so small as compared with last year, but it had improved in one particular, namely, the black Galloways.—Mr. Rigg then expatiated at some length on the subject of this description of stock, and his observations elicited the warmest applause of the respectable company.

Mr. WYBERGH proposed the health of the "Unsuccessful Candidates" which was acknowledged by Mr. Fell of Workington.

The CHAIRMAN next gave the health of Mr. Benson, the Secretary, who, in returning thanks, complained of the remissness of some of the collectors, and said if they were not more attentive in future it would be impossible to have more than one meeting annually.

The health of Sir F. Vane was also drank, with three times three.

The party broke up about five o'clock.

CULTIVATION OF COBBETT'S CORN IN LANCA-SHIRE.—Many of our readers will remember that, some years ago, a species of Indian corn, grown in the United States, was introduced into this country by Mr Cobbett, and strongly recommended by him for general cultivation. It will also be remembered that there was, at the time, a great deal of dissension as to the real merits of the grain, and especially as to whether it would grow in this climate or not, Mr. Cobbett stating that he had grown very fine crops of it on his farm at Barn Elms, in Surrey, and other persons asserting that it had never properly ripened, and never would in this country, except in unusually hot summers. Since that time we have seen it mentioned repeatedly, sometimes as having failed, and at other times as having succeeded. Amongst the most successful cultivators of it (if we remember right) has been Colonel Napier, the military historian, who has grown it at his residence, near Devizes, in Wiltshire; but we never heard

of its having ripened so far north as Lancashire until a few days since, when he saw a number of very fine heads grown by Mr. Willis Earle, on his land at Sandfield Cottage, near Prescott, in the shop of Mr. Skirving, of this town. On inquiry, we found that Mr. Earle had grown a considerable quantity last summer, that it had ripened in the open field, and that he was so much pleased with the success of the experiment, as to be about to grow three or four times as much the present year. It was not until after trying experiments for two or three years that Mr. Willis Earle succeeded in growing a good crop of Indian corn in the open field, and he is therefore of opinion that this plant, like many others, requires some time to accustom it to the comparatively cold and damp climate of England. From the great improvement in the quality of last year's crop, Mr. Earle thinks that the plant has got accustomed to the climate, and means to try it by growing three acres this year. His practice is to sow the seed in drills, three feet from each other, the seeds being six inches from each other in the row, to plough to and from the drills frequently, so long as it can be done without injury to the plants. The ground should be clean and well manured. He believes that he has raised a greater quantity of this grain than can be raised on the same ground of any other kind whatever. The flour of Indian corn makes excellent food both for men and animals; the heads of the plant may be eaten green, and the stem and husks are applicable to innumerable purposes. As a spring corn, if it should once become completely acclimated, it is likely to be of very great value.

**THE CITY OF DORT, IN HOLLAND, PRESERVED BY MILKMAIDS.**—During the wars in the Low Countries, the Spaniards intended to besiege the City of Dort, in Holland, and accordingly planted some thousands of soldiers in ambush, to be ready for the attack when opportunity might offer. On the confines of the city lived a rich farmer, who kept a number of cows in his grounds, to furnish the city with butter and milk. His milkmaids, at this time, coming to milk their cows, saw under the hedges the soldiers lying in ambush, but seemed to take no notice; and having milked their cows, went away singing merrily. On coming to their master's house, they told him what they had seen; who, astonished at the relation, took one of the maids with him to a burgomaster at Dort, who immediately sent a spy to ascertain the truth of the story. Finding the report correct, he began to prepare for safety, and instantly sent to the States, who ordered soldiers into the city, and commanded the river to be let in by a certain sluice, which would instantly lay that part of the country under water where the besiegers lay in ambush. This was forthwith done, and a great number of the Spaniards were drowned; the rest, being disappointed in their design, escaped, and the town was thus providentially saved. The States, to commemorate the memory of the merry milkmaid's good service to the country, ordered the farmer a large revenue for ever, to recompense him for the loss of his house, land, and cattle; and caused the coin of the city to have a milkmaid, milking a cow, to be engraven thereon, which is to be seen at this day, upon the Dort dollars, stivers, and doights; and similar figures were also set up on the water-gate of the Dort: and the milk-maid was allowed for her own life, and her heirs for ever, a very handsome annuity.

A correspondent asserts that the *true* reason why London pickpockets are said to make the best shepherds in New South Wales is that they have been such adepts at *fleeing* in the mother country.

**LANDLORD AND TENANT.**—On no one branch of agricultural operations has so much money been wasted as on draining, and in no particular part of draining has so much negligence been displayed, and so much mischief committed, as in the operation of filling in the stones and covering these stones with earth. Whilst we hold that for every pound expended by a tenant on draining, the proprietor ought to expend two pounds—we also hold that for every time the tenant looks after the workmen employed to execute this nice and most valuable work, the landlord, or his agent, ought to look twice. The landlord who never looks after the operations of his tenantry, and who cares not a single straw whether improvements be temporary or permanent, so long as he receives the promised rent, may, on the expiry of leases, find to his cost, that the lands, so far from being improved, have rather been deteriorated. A good, practical, and scientific farmer, so far from viewing a minute scrutiny of his operations as indicating a tendency on the part of his landlord to lord it over him, on the contrary, hails it as a sure proof that his landlord is interested in his welfare, and disposed to reward his industry, skill, and care. We have heard much of the generosity of some landlords who have only given a deduction of a few pounds per cent. from the rent of their tenants for one or two years, whilst the generosity of those landlords who have given their tenants a permanent deduction, by draining, where they were not bound by contract, and giving lime at little more than half the market price, have been hitherto kept in the shade. For our own part we look upon the landlord who aids the tenant to go on with improvements, as being more beneficent than the landlord who gives a small temporary money abatement. The great embarrassments under which the agricultural community now labour, render it absolutely necessary for landlord and tenant to enter into arrangements, by which improvements may be made permanent and the capital expended in draining, on the renewal of every nineteen years' lease, ultimately saved. By indiscriminate per centage deduction, the man who improves, and the man who does not improve, are treated alike. That agriculture may flourish, the landlord must ever be more beneficent to the improving than the non-improving tenant; and the tenant must ever be more disposed to rent land from the proprietor who encourages the prudent, than the proprietor who is satisfied with receiving his rent, without caring whether his lands have been improved on the temporary or permanent system.

The Annual Show of the Strathmore Agricultural Association, was held on the Market Muir Coupar Angus, on Thursday the 9th April. The show of stock surpassed anything that has been seen for many a preceding year. The judges felt it a somewhat difficult task to select, from the superior animals, the horse most worthy of the prize. They, however, unanimously agreed to award it to the beautiful black horse, belonging to Mr. Robert Wilson, Frithfield, Fifeshire. The judges and members, along with a great many other gentlemen, afterwards dined in the Strathmore Hall, which was suitably fitted up for the occasion. The Right Honourable Lord Kinross ably filled the chair. The croupiers were, Mr. Archer, Coupar Grange, and Mr. Robertson, Buttergask, and several other gentlemen gave a number of very excellent speeches, and the evening was spent in the greatest hilarity.

**TURNIPS FROM THIS YEAR'S SEED.**—It has been thought by many farmers and others, that turnip seed

of two year's preserving must produce bulbs of a more proportionable shape than seed kept for a shorter period. This theory, we understand, has been often put to the test by Mr. Laurie, seedsman here, who is in the practice of proving the quality of his turnip seed immediately after thrashing it out, and he finds it to bulb equally well, grow more freely, and swell to a much larger size than seeds sown in the former year. On the 9th of July last, he sowed more than half an acre with turnip seed grown this year, of green-topped yellow, bullock, and purple-topped Swedish; and many of the bulbs produced from the former weighed more than 3½ lbs, and those from the latter 2 lbs., specimens of which may be seen at this office, and at Mr. Imrie's shop.—*Ayr Observer*

**MALTING BARLEY FOR FEEDING CATTLE.**—During the debate on the repeal of the malt duty, Sir Robert Peel mentioned his wish that the following order of the Board of Excise should be made as public as possible:—"The practice of steeping barley in water to prepare it as food for cattle having become prevalent, and as the revenue may be injured by the application thereof to other purposes, ordered, that the respective supervisors and officers endeavour to ascertain the parties who carry on this practice within their several districts, and their manner of disposing of the corn so steeped; but that no interruption whatever be given thereto, except upon actual proof or well-grounded suspicion of fraud. Attention must be paid to the situation of the premises where the corn may be steeped, as to any kiln or oven in which it could be dried, as well as to the proportion which the quantities of barley steeped bear to the number of horses or other cattle to be fed therewith; and if any suspicious circumstances shall be discovered, the matter must be fully investigated, and the particulars stated to the board."—During the debate Mr. Cobbett said, that for the purposes of feeding cattle, more nutriment was contained in two bushels of malt than in three bushels of Barley.

## AGRICULTURAL REPORTS.

### BEDFORDSHIRE.

From the middle of February to the 20th of March we had here an unusual quantity of rain, which proved most unfavourable for the young lambs, particularly upon tenacious soils, in bleak situations, and where the lambs were just falling; under these circumstances, great losses have been sustained.

The latter part of the month, however, proved very propitious for all farm purposes, especially for sowing barley, having generally dry days, with frost at night, which materially assisted the farmer in pulverising the unkind soils. The weather during the present month has also been equally favourable, so that the greater part of the barley will be pretty well put in. The wheat upon very strong land turned sickly during the wet weather in March, but has since recovered, and is now, under good management, generally looking well. Winter tares, young clovers, and the pasture grounds in general, may also be considered in rather a forward state.

APRIL 17.

Since writing the above, we appear to have had a second winter set in; yesterday we had a heavy fall of snow, and this morning every thing around us presented the most wintery appearance, and the frost was the most severe we ever remember so late in the season. We apprehend the wall-

fruit, though appearances had been most flattering, will be generally cut off, and the damage to the young clovers, where stocked, will be considerable; while to the turnip and rapeseed we anticipate still greater injury. The price of wheat continues ruinously low; and barley, though a most deficient crop, has lowered in value as the malting season has drawn to a close.

Wool is rather inquired after, and average clips sell at about 1s 6d per lb, while fat mutton and pork can scarcely be turned into money.

The new poor laws are now about to be brought pretty generally into operation; the board of guardians for the respective divisions of this county are elected, and the overseers have received instructions to discontinue relief upon the old system after the 9th of next month. The season of the year, as well as the extreme low price at which the necessaries of life may now be purchased, are considered rather favourable circumstances for bringing about this new state of things. But, on the other hand, the total inability of the farmers to employ a single labourer more than they absolutely require, will necessarily leave a large portion to be provided for in some form or other by the board of guardians. We sincerely hope that they will be able to succeed, without any serious commotion among the poor; but, knowing as we do, how deeply rooted pauperism is in some parts of this country, we must frankly confess that we shall not be surprised at any strong expression of feeling against the new system which may prevail.

### OXFORDSHIRE.

The greater part of the month of March proved wet and stormy, and altogether unfavourable for working strong lands, so that the teams had but little to do, and field work, which had previously been in a forward state, got in arrear, consequently there remains a large breadth of barley to be put in; as the land is found to require a deal of labour to pulverise it properly, the stiff soils come up heavily; and except they are harrowed just at the moment they are in a proper working state, they get baked in the sun, and the labour to break them down is immense. Turnip land (when eaten off in March) breaks up in large clods, requiring both time and work to bring them into a proper condition to receive the seed. Beans are in general come up well, but where advantage was not taken to plant them in the fine weather we had in February, the delay occasioned by the continued rain last month caused some, indeed many, not to be finished until nearly quite April; this will be found in the samples, the quality of beans being so greatly affected by late planting. Wheats have much improved since our last report, the crop in some places being too rank and forward. Winter vetches are a fine crop, and very forward, so much so that on the reporter's farm they are in start of the famed *Trifolium Incarnatum*. For the last three nights we have had severe frosts for the season, and excessively cold as compared with the preceding few days; this pulverising effect of the frost on land recently ploughed, has been astonishingly beneficial, while on the other hand it is to be feared its effect upon the fruit and early peas will be most disastrous.

As regards markets, either for corn or cattle, bad as they have long been, yet still lower prices have the already half-ruined farmers been compelled to take for their produce, and, notwithstanding this march of ruin has for years been progressing, still each succeeding administration appear totally regardless spectators. We are of opi-

nion that this will be the case until the backward and lethargic farmers will unite in defence of their just claims to a share in the sympathy felt and acknowledged by government for OTHER classes of the community when under similar circumstances. Then let (we would once more exhort them) associations, in every market town at least, be speedily formed; but those who take the lead in their formation should take especial care that while they would very properly exclude politics they are not insensibly drawn into the snare so frequently laid by some crafty agent, for the purpose of strengthening some declining interest, therefore we would advise that the association be composed of farmers, and of farmers alone; put no great man at the head as president, and, above all, guard against the nomination of a number of vice-presidents—insist on having but one—and let that one be a respectable and intelligent agriculturist, a practical man, neither squire or clergyman; you will then be able to deliberate freely and fairly as to what is best to be done in this awful crisis of our affairs. We speak and offer this advice from experience of the baneful effects resulting from a different line being pursued.—April 17.

#### STRATHMORE.

The sickly aspect which the fields of young grass and wheat exhibited at the beginning of the month has been temporary. The beans and peas were in general got in during the third week of the month; and the ground being in the finest order for working, a proportion of the oat-seed was finished by the 30th, when soft showery weather set in, and has since so frequently prevailed that it is not yet entirely brought to a close. Considerable quantities of potatoes are still on hand in various parts of the country; a rise of any importance in the price is therefore not to be expected; and many are of opinion that this department of husbandry, so beneficial to this district for several years past, will henceforth afford as little remuneration to the farmer as the cereal crops have done for some time past; and the reason assigned is simply this, that the cultivation of the red potato has lately been introduced into England upon an extensive scale, and that they bring a higher price in the London market than those from Scotland. The sheep and cattle markets have been rather duller since our last. The same may be said with regard to the corn markets, especially for wheat, which is certainly below its nutritive value, when compared with the prices of the other sorts of grain; which, taken in connexion with the present scale of rents, are evidently under anything like a fair remuneration price to the agriculturist.—April 6.

#### NORTH RIDING, YORKSHIRE.

The weather has been variable of late; we had some thunder and lightning on the 2d inst. and some rain, since which it has been fine and dry weather, though rather too frosty at nights. The lambing season is nearly over, and I believe there is generally speaking a good crop of lambs. I would caution my brother farmers against keeping their ewes that are with lamb too long on their turnips: a friend of mine had his upon some Swedes, that were grown on a field that had been pared and burnt, until they lambed; he lost 28 lambs, when he took them off the turnips, after which no more died; the milk of the ewes ap-

peared in quite an unnatural state. The turnip grazing season is now over, and a sorrowful one it has been to many; thousands of acres of as fine turnips as need grow, after having cost the farmer a great deal of trouble and expense, have not paid him one farthing in return; many have actually sold their sheep for less than the cost in the autumn—great encouragement this for farmers! Well, the land is generally sown with barley; petitions are sent to Parliament praying for a repeal of the malt tax; it is well known how that matter has ended. The very best wheat which cost 8s per bushel growing, is now not worth more than 5s 3d—fine times for farmers! Good mutton sheep that were bought in at 5½d to 6d per lb, have been selling at 5 per lb, and so on. I should think that at this rate we shall have some kind of a change; it is capital news for the radicals; they want us quiet, peaceable farmers to be completely ruined, in order that they may the more easily come at our landlords, the aristocracy.

We have been uncommonly busy with spring seed time of late; not having an opportunity of getting beans and oats in so early as is common, it throws us out all together—am glad to state that ribbing or drilling is become more general. Rape dust is too high, and produce too low, for its being much used for barley this spring. Am glad to state that the beef and mutton markets are on the advance, more so than any one expected; it appears that there had been too many hurried to market for want of keep, when the turnips were done, which caused the late low prices, but there are not so many come to market now. Beef is worth 6s 6d per stone if very good; mutton 6d per lb. There has been a greater preference shown for small Scotch mutton than in other years; large fat sheep have been the worst to dispose of. Our wheat markets are shocking:—good wheat as low as 4s 6d per bushel, best only 5s 3d. Barley has sold at from 35s to 38s per qr. Oats 23s for good Friesland. Beans about 40s per qr. In store stock not much variation; it is thought that wool will keep its price. The wages of blacksmiths, carpenters, masons, &c., are the same as when wheat was 10s per bushel.—April 16.

#### PERTSHIRE.

The stormy weather which prevailed towards the latter end of February, continued till about the middle of the month, and during that period, committing of seed to the soil was quite impracticable. Sowing of beans and peas, however, commenced in the Carse of Gowrie, about the 16th, and from that date to the present, the weather has been most excellent for promoting the labours of the husbandman at this important season of the year. Lands intended for beans and peas were generally seeded by the 24th, and this department of farm labour could not have been conducted under more favourable circumstances. Sowing of oats has generally commenced in the lower districts of the county, and, as the soil has been so finely pulverised by the winter frosts, the stiffest lands were never known to yield more readily to the harrow. Growing wheat, which appeared rather sickly during the earlier part of the month, begins to resume its former healthy appearance; and with exceptions, seems sufficiently forward in growth for the season of the year. Clover fields look fresh, and we have seldom observed the clover and rye grass plants to be in more equal proportions.

Turnips in general are nearly consumed, and will have much ado to hold out till pastures are sufficiently forward in growth for the reception of live stock. Corn markets are still languid. Wheat meets a dull sale, at from 40s. to 44s. per qr. Oats, fit for seed, have been somewhat in request, and have risen from 1s. to 2s. per quarter in price. The same remark applies to seed barley, but inferior sorts of grain are almost unsaleable. Live stock are likewise declining in price; and as we anticipated in our last, turnips in many instances have gone for nothing: which, together with many untoward circumstances, press heavily both on the farmer and feeder. Few grass parks are yet let, but high rents are not anticipated. Young calves have seldom been in more request, and are readily bought up at from 10s. to 15s. each. Large quantities of potatoes have been lately shipped at our several ports for the London market, but the late returns have been rather discouraging, something about from 5s. to 6s. per boll of 3½ stone Dutch have only been realized. Peach and Nectarine trees, on open walls, are in full bloom, and promise an abundant supply of fruit. Apple and pear trees in orchards also exhibit a fair sprinkling of fruit buds. March dust, that invaluable article, has been in great abundance for the last ten days.

### AGRICULTURAL INTELLIGENCE, FAIRS, &c.

**ALFRETON EASTER FAIR.**—This fair was not so well attended as anticipated, although the day was very fine, but most kinds of cattle obtained full as good prices as could be expected, considering the depressed state of agricultural produce.

**HEREFORD EASTER FAIR.**—There has seldom been a finer supply of stock seen at this season of the year; and we congratulate the farmer on a little improvement in the price, and considerable in the demand. Every kind of stock sold; prime fat beasts averaging 5d per lb., while barren and all other stores, though a respectable supply, were nothing equal to the number in request. A moderate supply of sheep; fat wethers averaged 5½d per lb., lambs, 7d. Supply of pigs very small. The horse fair exhibited but few good animals; good cart-horses sold pretty well, but nothing doing among the inferior sort.

**GROSMONT FAIR** was better supported than any preceding fair. The supply of cattle was good, the attendance of buyers numerous, and the whole of the Stock met with ready purchasers at improved prices; fat stock sold at from 4½d to 5d per lb.: barrens and other stores in very great demand; sheep and pigs a moderate supply, the former rather higher in price.

At **DOWNTON FAIR** the show of sheep was not great; prices considerably lower than last year. Barreners, cows, and calves, were of a middling description. Horses were in plenty, and good ones sold at fair prices.

**MALTON PALMSUN HORSE SHOW AND CATTLE FAIR.**—Only a few horses were shown. The prime ones fetched good prices, but for every other description the demand was limited. From first to last, both as to the quality of the horses and business transacted, a worse horse fair never occurred within the memory of the oldest man living.—In the Cattle Fair, buyers and sellers were numerous, and a good deal of business was done at far better prices than had been anticipated.

**ADWALTON CATTLE FAIR.**—The show of cattle to-day was very extensive, and a greater number of buyers of calves were in attendance from the neighbourhoods of Manchester, Liverpool, and Sheffield, than we have witnessed for some time. Many sales were made the night before the fair. Good calving cows sold well, and very few were left unsold. Geld cows went off slowly, and many remained unsold, the graziers not being willing to give the prices demanded. The Horse Show was but indifferent, and little business was done, except as to a few for farming purposes, which were sold at low prices.

**NORTHALLERTON FORTNIGHT FAIR.**—There was a tolerable show of fat and lean cattle and sheep. Beef sold from 5s 9d to 6s, and some very prime at 6s 3d per stone. Mutton at 5½d and 6d per lb.

**BEDALE FAIR**, was abundantly supplied with fat and other beasts, which met with prices from 6s to 6s 6d per stone. The show of sheep was small.

**DARLINGTON.**—At our fair on Easter Monday, we had only a middling supply of cattle and sheep, but it was of a superior description—prices a trifle, higher, and sales brisk: Beef 5s 6d to 6s 3d; Mutton, 6s to 7s per stone. In the Horse Fair the show was only indifferent.

**The First MUIR OF ORD MARKET.**—There was more than 1,000 head of Cattle. Those sold brought from 5s to 10s a head less than they would have done last year. Three-year-old stots brought from 5l 18s to 6l 6s; two-year-olds from 3l to 4l 10s; calving cows from 5l to 7l. For Cheviot hogs 6s to 9s were given. No ewes were shown.

**THIRSK FORTNIGHT FAIR.**—We had a fair show of cattle and sheep at this day's fair, and a number of dealers, but great depression existed in the market. Of sheep the show was large for the season, and few sales effected. Beef 5s 6d to 5s 9d per stone; mutton 5d to 6d per lb.

**TRINITY MUIR TRYST.**—The show of Cattle at this market was much under an average, particularly of drove Beasts from the northern counties. Dealing was rather dull: but from the smallness of the supply prices were fully as good as anticipated, and but very few lots left unsold. Good three year old stots, of the Angus or polled breed, realized from 9l to 13l; two year old ditto from 5l to 8l; and year olds from 2l 10s to 5l per head. Drove Cattle brought from 9l to 14l according to weight and quality. Prime fat from 5s to 5s 3d; inferior ditto from 4s to 4s 6d per imperial stone. Good Cows, nearly calving, sold speedily at fully as high prices as fat stock. Farrow Cows and Queys for grass brought about 4s per imperial stone, estimated at what they will weigh when fat. There was a poor show of Sheep, consisting chiefly of ewes, and the prices (from 10l to 15l) not corresponding with the rates in autumn last. Fat Cattle and Sheep were from five to ten per cent cheaper than at this tryst last year, and with very few exceptions, all sorts of Stock have left little for wintering.

At **CHUDLEIGH FAIR**, Mr. William Bowden of Mamhead, had a score of extraordinary fat wether hogs, which was supposed to weigh 25lb. the qr.

There was a smaller number of sheep than usual penned at Devizes Green Fair on Monday last; but the prices, on the average, were rather better than those obtained at the late Illey fairs. Some very thick mutton, however, fit for a Christmas Show, could not obtain a bidder. Milch cows sold well, but very fat beasts, a small number of which were exhibited, were unsaleable.

**SHREWSBURY FAIR**, exhibited a capital supply of prime fat Cattle, most of which were sold at 4½d to 5d per lb; the latter price, however, was only obtained for a few of the very best. A good many stores were offered, and sold with difficulty; but cows and calves sold well. Sheep, particularly large ones, were plentiful; these sold at about 5d per lb; and some rather less; but prime small Sheep were worth 6d. Some small couples of hill ewes with lambs were sold as low as 25s, and the price ranged upwards to 45s per couple. Many large Sheep went back unsold. Small Pigs were higher; large were sold with difficulty at lower prices. A good supply of butter was offered, and sold at 7d to 7½ per lb. Cheese—Skim 25s to 30s per cwt. Middle dairies 35s to 45s. Best dairies 50s to 53s per cwt. The supply of Bacon was prodigious, and not nearly all sold at 3½d to 4d per lb. Hams 4½d to 5d per lb. We heard of several lots sold as low as 4d.—At Gloucester fair, on Monday, there was a tolerably large show of fat and lean Stock. Beef fetched from 4½d to 5d per lb. Fresh barren heifers and steers were in demand, and sold at good prices considering the times. There was a pretty good sale for Cows and Calves, but at reduced prices from those of last year. Small fat Sheep were in demand, and sold from 6d to 6½d per lb; but thick heavy mutton scarcely commanded 5d; small stores also were in demand, but there was no sale for the larger sorts. There was a good show of cart Horses, but such is the depression in agricultural stock that they could not find customers at any price, although they were offered at a reduction of nearly 50 per cent. from the prices of this time twelvemonth. Very few good nags appeared, and those were readily sold at high prices.

**LINCOLN HORSE FAIR**.—During the past week the arrival of horses commenced, and on the whole we have had a good show (although not so large as on former years), however, first-rate horses sold at very high prices, while those of a secondary description were in great demand, and sold well, also those of the nag kind, and good horses of the cart kind fetched fair prices, but inferior ones were rather heavy sale. We had a great number of dealers, and a deal of business has been done. Some foreigners were observed, who made large purchases.

At the **DAVENTRY EASTER FAIR** there was a liberal supply of cheese, and a considerable number of factors, which caused a brisk trade, the prices varying from 40s to 50s per cwt; there were a very few fair dairies sold as low as 38s, whilst the favourite Warwickshire dairies obtained as high as 56s. There was also a very good supply of beasts and sheep, which went off briskly at an advance. The fair, upon the whole, was well attended, and a considerable quantity of business transacted.

**ROMSEY**, April 21.—The supply of cheese for this day's fair was considerable, and there was an unusual number of purchasers for small quantities, but the general demand was by no means equal to the supply. For skim cheese, from 18s to 30s was obtained; half caward, 38s to 42s; North Wilts and white Somerset, 44s to 52s; red ditto, 54s to 63s; prime Cheddar, 70s; prices, in general, realising the factor nearly the same as in the winter, with, however, a falling off in the sales. The sheep, in quality, were superior, and produced, at a quick sale, good prices. For the horned cattle, too, there was a brisk sale of the best stock; those of inferior breed and condition remaining unsold. The show of horses was unusually bad.

**HOWDEN SPRING FAIR**.—The show of horses at the Spring Fair at Howden on Wednesday and Thursday, the 15th and 16th of April last, was not so large as was expected; a disposition to purchase was manifested by the dealers present, of which there was a much greater number than was found horses to supply. Every description that were adapted for present use were soon bought up, but the inferior descriptions were, as usual, taken back; nevertheless, we argue from the great extent of land that is gone, and is going down into grass in this district, and the spirit that is manifested in the breeding of horses, that in two or three years it will be found in the spring, as well as it is known to be in the autumn, the great emporium for all the best kind of horses. The show of cattle in the fair on Saturday was large; the continued cold chilling winds and intense frost, more appropriate to December than April, having checked the vegetation of grass, the buyers commenced their business with great caution, but before noon the greater part was disposed of. A little improvement in prices may be quoted from a few of the recent neighbouring fairs for every description of grazing stock. Fat stock from 5s 6d to 6s per stone. The show of sheep was large, chiefly hogs half-bred, and from the North a much greater quantity than usual have been wintered upon the farms in this part, the sale of which was heavy, not leaving that remuneration for the winter keep which they had realized for the last two or three years. At twelve o'clock the show of stock commenced for the premiums given by the Howdenshire Agricultural Society, and in consequence of the increased number of premiums, it was held in a close at the entrance to the town from Howdendike, of much larger extent than the ground on which the former shows took place, and under such arrangements as gave perfect satisfaction to the supporters of the institution. The judges were.—Mr. Wiley, sen. of Bransby; Mr. Foster, of Fockerby; and Mr. Fenwick, of Rawcliffe; of whom it is only just to observe, that their decisions have given general satisfaction. The following were their awards, viz:—To Mr. Simpson's coaching stallion, Gallant, 5l; Mr. Edmund Thompson's coaching brood mare, 2l; Mr. Edmund Thompson's hunting brood mare, 2l; Mr. J. Scholfield's, jun. coaching gelding, 3l; Mr. Durham's brown carting stallion, 2l; Mr. T. Watson's carting mare, 2l; Mr. Calam's bull, 2l; Mr. Edmund Thompson's breeding cow, 2l; Mr. Edmund Thompson's two-years-old heifer, 2l; Mr. Edmund Thompson's yearling heifer, 2l; Mr. Well's fat ox, 2l. (The two latter were shown in competition for one premium, but such was the attainment of perfection in both as regard animal breeding and fatness, being of the pure short-horn breed, that upon the judges suggesting to the Committee the propriety of giving a premium to each, it was acceded to, and the result gave general satisfaction.) Mr. H. Edward's boar 1l, and Mr. Clark's sow 1l. It would only be justice to observe, amongst the unsuccessful candidates, that Mr. Cragg's horse, Mr. H. Edwards's breeding cow, and Mr. Burton's, as well as several other's elicited great credit; and great expectations are formed from the increasing state of the funds, and the feeling manifested, that the next show will prove of a more extensive character and not less satisfactory.

**CARMARTHEN FAIR**, last week, was better supplied with cattle than usual, but buyers being very scarce, few sales were effected, and those at low prices. The supply of pigs was very small, and no purchasers.

**WOODBIDGE STOCK FAIR.**—This noted shew of Market Horses, was held on Monday last, and attracted a numerous company, the weather being remarkably fine and favourable.—The number shewn was 25, being less by ten than last year. The loss in quantity, however, was amply compensated for, by excellence of quality. Those who are considered judges, expressed their opinion that, with the exception of two or three, horses in finer condition, of more perfect symmetry, compactness of frame, power of muscle, and possessing all those desirable qualities for which the Suffolk Punch is famed, never before graced the field. Taste, with regard to choice of horse stock, differs, as much as in most other things; what some may consider superior points, others may think inferior, it is a difficult matter, therefore to particularize the best, especially when all are so good. We shall, therefore, confine ourselves simply to an enumeration of those horses which came under our notice:—**CART HORSES:**—Mr. Edwards's (Sutton) chesnut, and chesnut Colt; Mr. L. Doves's (Debenham) "Young Boxer;" Mr. Martin's (Brightwell,) chesnut, "Boxer;" Mr. Fryatt's (Martlesham) horse; Mr. Rist's (Foxhall) chesnut; R. N. Shaw's Esq., "Briton;" Mr. Wright's (Barningham;) Mr. Brook's (Melton) "Briton;" Mr. C. Todd's (Otley) chesnut, "Briton;" Mr. J. Largent's (Marlesford) chesnut, "Bumper;" Mr. Brook's (Henley) "Young Captain;" Mr. Spinks's; Mr. Freeman's (Henham) chesnut, "Briton," and "Young Duke."—**RIDING HORSES,** which were also very superior:—Mr. Culum's (Ipswich) "Gameboy," & "Young Partizan;" Mr. Lines (Thorpe) "Shales," and "Spotted Cob;" "St Hubert;" Mr. Pooley's (Debenham) "Sovereign;" Mr. B. Head's (Woodbridge) 2-year-old Colt by Sir Paul;" Mr. Freeman's (Henham) bay, "Whisker."—The cattle and sheep fair in the forenoon was badly attended, and little business done.

**LOCKERBIE SHEEP SHOW.**—**STEAM NAVIGATION.**—At the show of live stock, especially sheep, held at Lockerbie, in Dumfriesshire, on the 19th of March, the attention of the border sheep feeders was drawn to the facilities which the introduction of steam navigation gave to them, for disposing of their stock in the English market, and more particularly in Liverpool. Not fewer than from 20,000 to 30,000 of the half-bred sheep (Leicester and Cheviot) of that district are every year sent to the midland counties of England to be disposed of, in the month of April, at the spring fairs; and it was strongly recommended that a part at least of these sheep, instead of being sent in one mass, by land, should be despatched by the steam-boats plying between the Nith and the Mersey to Liverpool, during the months of April, May, June, and July, as the demand and the prices might render it profitable. Should this suggestion be attended to, it will add considerably to the import of live stock into this port, and perhaps affect the price of butchers' meat in this neighbourhood. How strange a revolution that is, by which the Dandie Dinmonts of the Scottish borders are made the purveyors for the people of Lancashire. It is another of the thousand triumphs of steam navigation.

The wheat crop promises well in this neighbourhood. Barley and oat sowing are nearly completed, and we are glad to announce to our readers that those farmers with whom we have had the pleasure to converse on the subject all agree in saying that the latter grains were never better got in, nor the soil in better state of cultivation.—*Southampton Paper.*

## REVIEW OF THE CORN TRADE IN MARK LANE DURING THE MONTH OF APRIL.

The languor and depression which has now for so many months marked the character of the trade, not only in Mark Lane but at Liverpool, and all the leading country markets, precludes the chance of offering many remarks that can excite the interest either of the agriculturist, merchant, or speculator. Millers are so well supplied from the local deliveries that they have little necessity of resorting to Mark Lane, unless to procure the finer qualities of Wheat, and the pressure, so long existing on the spirit as well as the powers of speculators in foreign grain, owing to the capital already locked up in bonded corn, that the means as well as the inclination are paralyzed of ever making any casual investment in free wheat, and thus relieving the market of any surplus beyond the consumptive demand. The operations of speculators are always viewed in an envious light, and in times of excitement the parties themselves have been objects of popular odium. It is natural that a man embarking his money in the purchase of any article of grain, acts under the impression of self-aggrandizement, yet, on the broad principle of the fact, he is contributing to a public benefit, and ought to be reckoned amongst the most serviceable members of society. In foreign countries magazines or store-houses for grain are erected by government in different parts of the kingdom in order to provide for a scarcity. These institutions may be necessary in countries in an imperfect state of civilization; but that which requires the authority of government to accomplish abroad, is effected in England by the commercial and enterprising genius of our countrymen, who are induced to enter into speculative purchases, and risk their property at one period, with a chance of reaping a profit during the deficient season which may occur; and the supplies by these means of a good or failing crop are in great measure equalized to the customers, who, without these operations, must either pay an exorbitant price for their food or incur the chance of starvation, or the clumsy machinery of government be resorted to. Under most circumstances, therefore, the speculator merits the attention and assistance of government in order to relieve part of that capital, which the chance of the seasons and the acts of the legislature may have rendered unavailable. These remarks we have been induced more particularly to make, in consequence of some unreasonable remonstrances, which have been made to the French government from some agriculturists and interested parties in the Western Departments of France against the privilege of merchants and others grinding foreign wheat into flour for export to Algiers. In countries where the annual growth is barely commensurate to the consumption, it is no injustice to the home grower this mode of traffic. In England all the bearings of the case are applicable; we have no surplus wheat on an average of years, and the

prices of the raw material effectually prevent any competition on our part with foreigners in supplying with biscuit and flour the West Indies, Newfoundland, South America, and even our own foreign trading vessels. If government, therefore, were to allow flour to be made from the bonded wheat, which is now lying in granary, incurring heavy granary charges, and, in some instances, almost destroyed by weevil, and, in very many cases, much infected with this destructive insect, whose ravages daily increase, it would be no more than an act of justice in the legislature to a most useful part of the community—the *speculators in foreign corn*.

The supplies of wheat throughout the past month have been liberal, amounting to about 35,000 qrs English, and 1,800 qrs Scotch qualities. During the first three weeks, the same dullness and languor, which has so long pervaded the market, continued to exert its depressing influence on the trade; millers manifesting little disposition to purchase, even at the depreciated state of the currency, which is as low as has been experienced since the year 1786, when the annual average of the kingdom did not exceed 38s 10d Winchester measure. The finer qualities of white wheat have receded 2s to 3s per qr, red qualities 2s, and inferior qualities fully 3s per qr; towards the close, however, of the month, the supplies diminishing, and the condition of the samples having improved, caused more inclination to purchase, and the finer descriptions steadily maintained their rates, with symptoms of improvement, the low rates having, at length, created some speculative attention. In bonded wheat nothing transpiring, though orders have been transmitted abroad at the prevailing depressed currencies.

The receipts of flour have been large, amounting together to 38,000 sacks, which has much depressed the trade; and the best town made qualities have given way 2s per sack, 38s being the top currency; ship marks have also become 1s. to 2s. per sack lower, and good fresh samples have been selling, ex-ship, at 27s 6d to 28s 6d.

The alterations in the duties consist of an increase of 1s per qr. on wheat, the duty being 47s 8d, and the aggregate average of the kingdom has declined to 38s 10d. The duty on peas has advanced 3s per qr.

The importation of English and Scotch barley has much decreased, but from Ireland we have been rather more freely supplied, and from Denmark and Holstein the arrivals have been liberal. We have received about 10,600 qrs of English, 2,000 qrs Scotch, 4,400 Irish, and 15,800 qrs foreign. The foreign samples, most of which have been offering free, having paid the duty of 13s 10d, has materially influenced the market for all descriptions of British quality, particularly the secondary sorts; and though the imports of English have been limited, yet the advanced period of the season, and some of the prin-

cipal maltsters having nearly supplied themselves for the season, added to the fineness of the weather, and the anticipation of augmented supplies from abroad, have acted on the mind of purchasers, and checked their operations. Fine Chevalier barley has sustained little deprivation in value, but Norfolk and Suffolk qualities are 1s per qr. lower, and Danish and Holstein 2s to 3s, fine Holstein having realized at the beginning of the month, 38s; and being only now worth 35s to 36s. Few distillers have appeared at market, distilling qualities therefore have ruled extremely dull. Grinding barley however has remained steady, and will no doubt be in request during the summer.

The malt trade has remained in a very dull state, the brewers having evinced little disposition to purchase, and though the finer qualities have nominally suffered no depreciation in value, yet secondary and inferior samples are fully 1s to 2s per qr lower.

The supply of English oats has been very limited, consisting merely of 7000 qrs. From Scotland, the receipts, as compared with the month of March, have much fallen off, amounting only to 20,000 qrs; but from Ireland, the accumulation of supplies, which had been detained by unfavourable weather, having arrived, has increased the import to 90,000 qrs. Notwithstanding the extensive importations of Irish oats, the article has experienced a steady sale throughout the month at improving rates; and as dealers have exhausted their stocks in waiting for the Irish arrivals, they have continued free purchasers, which with a good country demand has enabled factors to realize an advance of 2s 6d to 3s per qr. Bonded qualities are also held on higher terms; foreign feed in bond being worth 13s to 16s per qr. In the free on board Irish trade, there has been considerably more activity; very high prices are now asked from the Southern Irish ports, and nearly all the oats that have been offering at reasonable rates have been taken off the market. In referring to the annexed account of the import of oats into the port of London during the first three months of the years 1834, and 1835, we find a considerable increase during this season, particularly from Ireland, where from, almost every part, the difference is great, especially from the ports of Dublin, Galway, Londonderry, Sligo, and Waterford. The demand for the British Channel ports has prevented the increase being so large from some of the Southern ports, (Youghall, and Lime-  
rick for example,) but the exports from Ireland have already so far exceeded their amount in the generality of seasons, that we infer their must be much less than usual at this period of the year left for future shipment.

| First quarter of 1834 | English. | Scotch. | Irish,  |
|-----------------------|----------|---------|---------|
| Oats qrs .....        | 68,770   | 86,557  | 95,374  |
| Do. 1835              | 26,423   | 110,839 | 190,927 |

Beans being always more or less influenced by the price of oats, have partially participated in the improvement of that article and have realized an ad-

vance of 1s to 2s per qr, with a very limited show of samples; bonded qualities meet inquiry and are held at 23s to 25s. White boiling peas have hung heavily hand, and the sales effected have been at very low rates. Grey and maple qualities have sustained little alteration in value.

The grain trade in France has sustained little alteration in demand or price, the last aggregate value of wheat throughout the kingdom having been 34s 4d. The young wheats are generally represented as assuming a promising appearance, though in some places, on the richer soils, much choked with weeds: and in other parts, particularly on the poorer lands, much in want of rain; indeed, the drought is already beginning this season, the same as the last to exert its injurious influence on the forthcoming crops, especially as regards summer corn. At Paris, holders were demanding higher rates for Wheat than purchasers were willing to accede to, and consequently little business was transpiring. The growth of lucerne has been effected in some places by the night hoar frosts. The rape plants have also suffered from a similar cause.

At Leghorn, prices remained dull and unaltered. English and Dutch white wheat was noted at 29s 1d to 31s 4d; red, 27s to 29s. Tuscan white wheat was worth 45s 2d; red ditto., 39s 6d. At Naples, some improvement had been experienced in wheat, owing to a report that an importation of the article would be permitted at Cadiz; since which, however, the currencies have relapsed to their former rates. The young crops after the rains had every promise of a satisfactory return. At Trieste, the demand for grain and pulse continuing very limited, and the prospects of the ensuing crops being favourable, prices had declined. Seeds, likewise, were lower, though the advices from Hungary and Lombardy as to the crops of rapeseed were unfavourable.

In Canada, both the wheat and flour trade are very inanimate, and few contracts have yet been entered into for spring shipment of flour. Good qualities of wheat were to be obtained at 4s 3d per bushel, and finest at 4s 6d: superfine flour, for spring delivery, was held at 22s 6d per barrel. At New York, prices of wheat were improving, owing to the short supply. Long Island quality had realized 40s 8d; inferior northern, 37s. Oats were declining, and noted at 17s 3d. Flour varied from 24s 2d to 25s 10d per barrel, as in quality. Cloverseed experienced rather an animated demand at about 5d per lb. In Boston, cloverseed was selling at 4½d to 4¾d per lb. In Baltimore, white wheat sold at 39s 7d; red ditto., 36s 8d; Howard-street flour was firm at 22s 3d per barrel.

In the Russian markets, corn at present attracts little attention, and prices at St. Petersburg and Riga remain nominally unaltered, Kubanka wheat being held at 30s 5d, Courland do, 28s. The only

article in which any business of interest is transacting is linseed, the prices of which are fully supported; Morschansky and similar qualities are worth 42s 9d; Riga ditto, 44s 3d to 48s 3d. At Danzig the supplies continued limited, but as little demand existed, purchasers would only buy on lower terms, which holders unwillingly acceded to, as at the present low currency any reduction is an actual loss to the consigners: general runs of high-mixed wheat have been bought at 28s. The chances seemed very remote of receiving Polish supplies this year from Volhynia by the Bug, as the river being very shallow, and the character of the season being dry, the water is not likely to have sufficient depth for the barges to reach the Vistula. At Königsberg, a few speculative purchases of secondary qualities of wheat have been making, white being bought at 26s, and red at 23s. Rye, barley, and peas, were meeting an animated demand for the consumption. At Stettin, prices of grain remained steady, and rather more business transpiring. Wheat was quoted at 23s to 24s; barley, 17s 6d; oats, 13s. In Mecklenburg, prices of wheat had rather receded, and quality of 63lbs could be purchased at 22s; best barley at 15s; oats of 34lbs at 11s 6d. As, however, the stocks of grain were generally much shorter than usual, the currencies were not likely further to decline. The Holstein and Danish markets were dull, and the currencies rather lower: Holstein barley might be bought at 16s 6d, Danish at 15s; oats, 10s 6d to 12s 6d; wheat at 20s 6d to 21s 6d; rapeseed had been sold on contract for delivery at 30l per last, and 40l had been paid for a small parcel at Copenhagen. In Sweden, oats were offering at 11s 6d per qr. At Hamburg, some purchases of wheat had been effected for the Channel Islands as well as English account, fine Mecklenburg of 62lbs obtaining 22s 3d to 23s. Marks and Brunswick wheat remained at 24s 10d to 26s 1d. Beans were offering at 22s to 23s. The Saale Barley which had arrived was held at 18s 6d to 19s 6d. Small tares had declined to 21s 6d to 23s.

TO

## THE FARMER'S MAGAZINE.

### THE BANK OF ENGLAND.

(From the Times.)

The usual monthly average return of the liabilities and assets of the Bank of England, embracing the period from the 13th of January to the 7th instant inclusive, was inserted in last Friday's *Gazette*, and from which are deduced the following results—viz. that the average of the month ending the 7th instant, as compared with the average of the month ending the 13th of January, shows an increase in the circulation of 800,000*l.*, a decrease in the deposits of 4,976,000*l.*, and a decrease in the stock of bullion of 621,000*l.* Upon balance of account, it therefore appears that there is a decrease in the liabilities of 2,136,600*l.*, and this represents the decrease in the total quantity of money in the month ending the 7th instant, as compared with the month ending the 13th of January, in so far as regards the administration of the currency by the Bank of England.

The yearly comparison is as follows:—The average of the month ending the 7th inst. as compared with the average of the month ending the 6th of May, 1834, shows a decrease in the circulation of 27,000*l.*, a decrease in the deposits of 3,972,000*l.*, and a decrease in the stock of bullion of 2,457,000*l.* It therefore appears that there is a decrease in the liabilities of 3,999,000*l.*, and this represents the decrease in the total quantity of money in the month ending the 7th instant, as compared with the month ending the 6th of May, 1834, in so far as regards the administration of the currency by the Bank of England.

The preceding statements and remarks relate to differences only. The following is a statement of the actual average amount of the circulation, the deposits, and the stock of bullion, during the month ending the 7th instant:—

|                   |             |
|-------------------|-------------|
| Circulation . . . | £19,053,000 |
| Deposits . . .    | 11,557,000  |
| Bullion . . .     | 6,536,000   |

The following is a statement of the actual average amount of the same items during the month ending the 6th of May, 1834:—

|                   |             |
|-------------------|-------------|
| Circulation . . . | £19,080,000 |
| Deposits . . .    | 15,529,000  |
| Bullion . . .     | 8,993,000   |

And the following statement will exhibit the actual average amounts of the same items during the month ending the 7th of May, 1833:—

|                   |             |
|-------------------|-------------|
| Circulation . . . | £20,001,000 |
| Deposits . . .    | 11,788,000  |
| Bullion . . .     | 10,952,000  |

And, therefore, by comparing April, 1835, with May, 1834, the circulation is nearly the same; but there is a decrease in the deposits of about 4,000,000*l.*, and, by comparing May, 1834, with

May, 1833, there is a decrease in the circulation of 1,000,000*l.*, but an increase in the deposits of nearly 4,000,000*l.*, which is the same amount as the decrease in the period from May, 1834, to April, 1835; and so that, first, the deposits vary 4,000,000*l.* in one sense, and then again vary 4,000,000*l.* in another sense, in order to recover their former position; while the circulation varies only 1,000,000*l.* during the first year, and afterwards remains steady. Now, all this plainly proceeds from the operations of the Bank of England, which, creating a large mass of money that is not required for the regular affairs of the community, the surplus naturally overflows from the circulation, and returns to the Bank to increase the deposits, and then, after having remained a while unemployed, this money not being required for domestic purposes, is taken out in the shape of bullion, to be exported to foreign parts, and thereby the deposits and the quantity of money generally come to be diminished. Wherefore, upon the matter it appears, that the Bank, having, for purposes of its own, created a large mass of paper money that was not wanted, this paper money has been destroyed by the exportation of bullion, and now the result is, that the Bank has only 1,200,000*l.*, less liabilities than in 1833, while its power to acquit them in bullion is lessened to the extent of 4,400,000*l.* This is how the matter stands simply and absolutely, but proportionally and respectively considered it is still worse, for, in 1833, the proportion which the bullion bore to the liabilities was rather more than 1-3*d.*, whereas now it is rather more than 1-5*th* only, the absolute amount of liabilities in both cases being nearly the same.

### THE CHURCH.

(From the Herald.)

There are few occasions on which a recurrence to first principles does not advance the cause of truth and justice; on many such a recurrence is indispensable. Such is our present position on the important subject of domestic politics. Some of our public men, and unhappily among these a large proportion of the popular branch of the Legislature, are getting so wide of first principles as to be apparently in danger of losing sight of them altogether. With such persons history becomes, indeed, little better than "an old almanac."

Of first principles, to which a recurrence is at this time especially necessary, none is so important as that which should be impressed upon every one's mind—that ours is a Protestant State and a Protestant Constitution; that the Protestant religion is its corner-stone, and that upon the maintenance of which the very existence of our liberties depends. We know not to what object the two great events of our past history, the Reformation and the Revolution, tend, unless it be to this,

It was to free us from Popery, as the great enemy of public freedom and liberty of conscience, that the struggles of our ancestors, which brought about those two great events, were undertaken. We have no wish to see a religious clamour raised in the country, or to interfere in the slightest degree with those sentiments and convictions which every man's conscience is entitled to hold on that important subject. But religion has a public, as well as an individual character and influence; and, in the former the Protestant Church is as essential a pillar in sustaining the great edifice of our constitutional rights and freedom as the Habeas Corpus, Trial by Jury, or any of those other great bulwarks to which we have hitherto owed its support. But it is said that in Ireland the Protestants form by far the minority of the population, and therefore should be in effect suppressed. As well might we say that in the mother country the Catholics are to as great an extent the minority, and therefore ought not to be tolerated; than which no idea, we believe, is more foreign to a Protestant mind. But as far as the Protestant Established Church is concerned, the two countries are united, are one and the same. The united Church was so recognised at the period of the Union, and the oaths of each branch of the Constitution are the safeguard by which the existence and security of the Protestant Church, so united, is to be maintained. It is not, then, because Legislators themselves may be of a different religion, or (if unhappily such should be the case) that some of them may be of no religion at all, that the Crown, or the two Houses of Parliament are to succumb to such consequences; or that the great majority of the right-judging part of the community can be indifferent to any thing which endangers the stability of that on which the existence of the Constitution depends. That such an inroad is now attempted, he must be blind, indeed, who does not perceive; and it is the duty of those who see the danger to caution, though they may not wish to alarm.

### PAUPERISM.

(From the Globe.)

We insert in another part of our paper an estimate of the comparative amount of pauperism in the principal European States, from a work lately published at Paris by M. de Villeneuve-Bargemont.

Much attention has recently been called to the subject of pauperism in France, as well as in this country. But as the investigation proceeded on very different grounds on the two sides of the channel—the subject of complaint in France being not the misapplication, but the insufficiency, of the funds applied to the alleviation of poverty since the decay of those great ecclesiastical foundations on which this office formerly devolved—it is the more remarkable that inquiries starting from such opposite points of view have in many respects arrived at the same conclusions. A well informed paper on the state of French pauperism will be found in the recent number of the *Foreign Quarterly Review*.

It appears in the first place, that in France, as in many other countries, the most pauperised districts are precisely those in which wealth is most abundant. In the north of France property is less divided, and capital more widely dispersed, than in any other portion of the kingdom. There is, however, little or no waste land, and the peasantry enjoy few of those common rights in the forests and pastures (*droit de parcours, droit de paturage, &c.*) which form

so remarkable a feature in the agricultural economy of other provinces. Here, in the Department du Nord, the chief seat of the cotton manufacture, we find pauperism as prevalent as in the worst regulated parts of England; every sixth inhabitant is a pauper—i.e. dependent on the public charitable funds in whole or in part. In the city of Lille 22,000 inhabitants out of 70,000 are said to belong to this class; in the Pas de Calais they form 1,9th of the whole. Advancing farther from the coast, we find in the department of the Seine (Paris) 1-14th; in Meuse, Meurthe, Moselle, amidst the well-managed and orderly population of Old Lorraine, 1,50th only. Finally, in the poor, half cultivated Lozere, only 1,40th; and in Creuse, a central department, which presents an aspect of poverty almost unrivalled in western Europe—the very Connaught of France—only 1,58th of the people classed as paupers! Thus proving, that although the proportion is not every where exactly preserved, yet wealth and civilization seem generally to progress in the same ratio as pauperism.

In tracing the economical history of France, we find a distinct compulsory poor's rate established by letters patent of Francis. I. in 1544, and the ordinance renewed in 1566 and 1586; so that, after all, the famous 23d of Elizabeth, usually held so peculiarly English an enactment, was probably borrowed from foreign experience. However, the compulsory rating, as well as compulsory removal to a place of settlement (for this too was a part of the old French law), fell into disuse, although never abolished. The clergy were the only active administrators of national benevolence, and that only of a voluntary character, at the period of the Revolution.

During the Republican epoch the principle of poor laws was recognized by the Convention, when the subject was forced upon its notice by the increase of distress and vagrancy in those disastrous times, before the army had furnished an outlet for superfluous population. But its schemes were so much tinctured with extravagance, that no part of them was practicable except that which related to the abolition of former institutions. Thus great part of the hospital and other charitable property of the country was sold (perhaps, after all, an advantageous circumstance), but no plan for the employment of the funds thus obtained was ever realized. Among the fancies of the Jacobin legislature we may notice the law of June 24, 1794, by which each department was to have the right of entering about 1000 names of paupers (*patriotes indigens*) who were to have yearly pensions of from 160 to 60 francs, with increase for families above a certain amount, while honorific annuities of 120 francs were awarded to unmarried mothers (*filles-mères*) for their services in given children to the state!

Napoleon's precipitate measures did nothing towards repressing the evils of vagrancy, but they were little felt, although suspended only, during his active reign. Ever since the conclusion pauperism has been regularly and rapidly on the increase, notwithstanding the subdivision of property, which some have imagined likely to arrest it.

The principal establishments of public charity (besides the hospitals and the *hospices* or receptacles for aged and infirm persons, which all seem to possess property of their own) are the *Bureaux de Bienfaisance*. The revenues of these boards are composed—1. Of funds arising out of the surplus income of hospitals, &c., which in France are for the most part very liberally endowed. 2. Of legacies, gifts, &c. 3. Of money raised by public subscriptions, church collections, and similar means. (The two last sources of income, it will be remembered by those

versed in the economy of the poor in Scotland, constitute there the chief supply wherever rates have not been introduced.) 4. *Centimes additionels*. These are a kind of supplement or sur-charge, imposed by government together with the indirect taxes, in localities where the *Bureau de Bienfaisance* appear to stand in absolute need of such assistance. But if we may believe the writers who have examined the subject, the succour from the funds of the state is very sparingly and cautiously administered. The relief given by these *bureaux* is always in kind, except in cases of age and infirmity, and appears to be calculated on the lowest possible scale, leaving further assistance to be supplied by individual charity. Thus far the system appears well imagined, and on the whole well executed. We shall notice hereafter its defects, as compared with those of our own system.

### THE PEEL ADMINISTRATION.

(From the *Globe*.)

In accordance with that species of political optimism which yesterday led us to trace the beneficial purposes which had been served by the five months' existence of a Tory ministry, we repeat, that we are very glad the experiment has been tried thoroughly, and that we do not regret either its time or cost.

It is an excellent characteristic of political struggles in this country, that the downright English obstinacy with which they are fought out by the parties makes the ultimate victory of public opinion more signal, and matures its decisions, hearing having been given to the pleadings on both sides. The sudden triumphs sometimes gained by the popular cause in other countries have not many parallels in English history. The English people seldom can be moved *en masse*; and neither thinks nor acts in herds. As in the civil wars the royal and popular cause was contested from county to county, and the royal tenantry, under their hereditary leaders, made head for a while against the towns and the capital, so, in our more civilised recent contests, the country voters in many parts have been marched under the banner of prerogative to the poll, as of old they might have been to the field. From the duration of these territorial influences up to the present day, as well as the direct use of the powers of the purse, and of corporations, a very chequered aspect of things is presented in every political contest where the public excitement does not rise sufficiently high to flow over its ordinary bounds and enclosures. The corrupt and illicit portion of these influences we may shortly hope to see swept away. The habitual and voluntary deference to established station, which still exists in England to so large an extent, we trust will survive the less legitimate outworks which at present surround it. Our motto is not *Delenda est Carthago* with regard to the aristocratical spirit still remaining amongst us: we would provide against the compulsory or corrupt uses of wealth and rank, but leave their indirect and habitual influences to the course of nature. The mass of men cannot, as yet, at least, be governed by pure reason; in government as well as religion they must have forms and symbols; and in both old are better than new—by virtue of age, if for no other reason. Respect will not attach itself in the common mind to entire novelties.

The triumph of public opinion, as we have said, is the more complete in England, the slower its

march, the more repeated its struggles, and the harder its victory. The success of reform in Parliament was only won by protracted contests, and the carrying out the principles of that measure has met a shorter, but numerically stronger resistance. The re-action, everlastingly announced by the Conservative party, had taken place to as great an extent as it ever could be expected; that is to say, a certain degree of apathy and exhaustion had followed on intense feeling; and deferred hope (which had sometimes been extravagant) had caused disappointments. Well, the anti-reformers took their full advantage of this lull in opinion; they took advantage of all that remained of good unaccomplished since the reform; they promised to do all that remained undone. Nay, *credite posteri*! they actually made demonstrations of setting to work on more than one measure of public usefulness.

They have wonderfully cleared the way for their successors. They have, first of all, demolished the *prestige* of the pretended re-action which they proclaimed in the name of the country against further progress in liberal measures. They have, secondly, espoused reform principles on several subjects, on which they can never again utter the cry of "No innovation!" And, lastly, by bringing the contest between them and their opponents distinctly to an issue on a question of leading importance and urgency, they have chalked out for their successors a clear line upon that question; they have rendered it henceforward impossible that the principles on which the Melbourne ministry went out, and in resistance to which the Peel-Wellington party came in, and are turned out again, should fail of being carried into effect by whatever hands may now receive, or can now accept, the government.

### SMUGGLING CORN.

(From the *Comet Guernsey Paper*.)

When the right honourable Sir Alexander Baring was asked a few nights since in the House of Commons, whether the bill he was about to introduce for preventing the importation of corn into England, should extend its provisions to the Channel islands, replied "that if there were one part of the case more positive than another, it was the detection of fraud in the island of Guernsey."—As soon as such a mischievous allegation reached us, we commented upon it, in order to show its palpable absurdity. We are glad that our remarks have been inserted in several of the London journals, so that Englishmen will have had an opportunity of judging upon what shameful ground our character has been traduced before the nation.—But as the subject will again occupy the attention of the House of Commons, it may not be improper to bring before the public some additional particulars, to show into what a vortex of absurdity our accusers must have plunged themselves, before they could be brought to believe the tales of malevolence preferred against this island.

When the charge of fraud was made on the subject in question, the authors of it knew, or ought to have known, the precise circumstances under which grain is exported from this island for the English market, to justify the charge. Did they know that before a single grain of corn can be exported from this island, it is necessary that the grower should appear before a magistrate of the royal court, to swear that it is, not only of the growth of the island of Guernsey, but that it is the

produce of his own estate, and that upon such declaration on oath, he receives a certificate from the magistrate before whom he swears, and that that certificate is put into the hands of the purchaser at the time when the purchase is made, or the delivery takes place? And moreover, did they know that the shipper before he can export the quantity purchased, is under the indispensable necessity of producing the whole of the certificates of the persons from whom he has purchased the said corn, to the Bailiff of the Royal Court, and to make oath that the quantity shipped and designed for exportation, is *bona fide* the very same article set forth in the respective certificates which he then produces? Now if they knew that all these precautions were taken by the constituted authorities of the island to prevent fraud, they must have entertained the notion, and acted upon it, to justify their accusation, *first*, that the growers of corn must have *perjured* themselves in selling an article as the produce of this country, when they knew it was not; and, *secondly*, they must have believed that the shippers of corn for exportation into England, must also have *forsworn* themselves in their declaration on oath, that the quantity they had shipped was the same they had purchased of the growers, when they knew it was false! These are some of the inevitable consequences resulting from the reckless charge of fraud preferred against our islanders, but which was utterly disproved by the inquiry set on foot by his majesty's late government, not many months since.—If the accusers did not know what precautions are taken *here* by our authorities to prevent fraud, their ignorance of this matter only serves to aggravate their guilt, and clearly demonstrates the absence of every honest and honourable principle in the course they have pursued, in attacking the probity and morality of our inhabitants. So serious a charge should never have been made on slight grounds, especially when official documents were at hand to satisfy the most scrupulous and unlimited enquiry. In whatever point of view we contemplate the conduct of the accusers, nothing can justify the course they have adopted. It was a law in ancient Rome, that no man should be condemned till the accused and the accuser were brought face to face, and a fair opportunity given to the former to answer for himself; and surely, it is no more than rational and just that Guernsey men should expect the same treatment in Christian England, which never was denied in Heathen Rome.

#### THE PEEL ADMINISTRATION.

(From the Courier.)

After a troubled existence of four months the Peel administration is at an end. It was born of the agitation, got up by the Orange-Tory-High-Church-party during the last summer and autumn; and the avowed object of forming it was to uphold the Church of Ireland. On that principle Sir Robert Peel and his friends took their stand in opposition to their opponents; and to compass that object they were even lavish in their professions of reforms in other departments of the State. The announcement of measures—abating 25 per cent. on the tithes of Ireland—for making the marriages of Dissenters a civil contract—for settling the tithe question by voluntary compromises on the principle of justice—for reforming the Ecclesiastical Courts—were so many bribes to allow him to carry out his one principle of protecting the Church of Ireland. All would not do. He fought

manfully. We have always given him credit for having conducted the hopeless contest with admirable skill and great energy; but the in herent injustice of his cause was such that it bore him down, and his great talents have only rendered the defeat of his party more striking and decisive. He last night stated, that the vote of the House of Commons on Tuesday night “implied the necessity of a total change of the system of government in Ireland, so far as the church revenues were concerned.” That was, on his part, an admission, after having striven to the utmost, that the object for which he had formed an administration had completely failed, and that a change must take place in the Church of Ireland. To what extent that must go, it is not our present object to state.

We are far less surprised at the result than that Sir Robert Peel, with the good sense he has generally evinced, should have undertaken to manage the government upon the principle of maintaining the Church of Ireland. When Eldon was united with Wellington—when Grant and Palmerston sat on the same benches with Sir Robert—when the whole Tory force was united and unbroken—when the taxation of the country was thirty millions more than at present—when the generation then in existence was far more attached than this to the prejudices of the one which preceded it—when the supreme power of the government had been almost unassailed, and the charm of its invincibility was strong over the public mind—even then the Tories could not resist the pressure from without, and they were obliged, gradually, to give up taxation, to reduce the establishments, and to commence a reform in the administration of the laws. After they had commenced such a reform—after a new generation, imbued with reform principles, had grown into existence—after repeated defeats had shown that the Government had no power to resist the popular and national will—after the Government had conceded to overbearing public opinion, the repeal of the Test Act, Catholic Emancipation, and Parliamentary Reform—it does seem to us something like madness in the Tories to suppose that they could now resist the onward flood, or stop the pressure from without. The supposition argues, in them, a total ignorance of the events of the last few years. It seems probable that they learn so much in early life, that they become incapable of correct observation. They seem never to separate the precepts drilled into them, which are adapted much more to past time than present circumstances, from the rules those circumstances teach, and with all the fondness of a first love and early associations, they give more weight to the lore of books than to the wisdom taught by facts. The present total defeat of the Tories ought to teach them; and ought to teach all classes, a memorable lesson. Humiliating as it may be to those who have espoused the principle that the people are to be governed in spite of themselves, the truth that this is an impossible principle is what the present circumstances teach. The inference to be drawn from it is, that the future progress of the Government, let who will administer it, must be in conformity to the wishes of the great majority of the nation, including all classes, or the Government itself will be broken to pieces.

#### IRISH CHURCH REFORM.

(From the John Bull.)

Well do we remember when that ministry, which

has been so often taxed with a stubborn disinclination to Reform, had carried the Roman Catholic Emancipation, of which their more liberal opponents had *talked* for half a century, how we were denounced as ultra-illiberals and benighted bigots, and vindictive tyrants, for suggesting that the admission of Roman Catholics into the Protestant House of Commons would eventually subvert the Protestant Church. We were then told that the effect of such admission would be scarcely perceptible—that, perhaps, some three or four Roman Catholics *might* avail themselves of the privilege of sitting in Parliament; but that, when their claims, as they were called, had been once conceded, nothing further would be heard of them politically, and that, in fact, the Roman Catholic religion itself, deprived of the stimulus derived from oppression, would decline altogether in Ireland, so that we might look forward to Halcyon days of peace and tranquillity.

In vain did we quote the evidence of Mr. Arthur O'Connor, that "Catholic Emancipation had nothing to do with the tranquillization of Ireland," and in vain did we suggest the mischief which must result from concession. To soothe, however, our apprehensions lest any unforeseen circumstances should cause a serious influx of Roman Catholics into the House of Commons, we were satisfied by a solemn oath, to be administered to such persons, that they should so regulate their parliamentary conduct as that no mischief might arise to the constitution or the Protestant establishment. To this security Mr. O'Connell made no objection, and upon this we have to say a word or two.

It now appears that these apprehensions of ours, which we so meanly, blindly, and partially expressed, have come to be realised. Of the number who divided against ministers on Thursday in favour of appropriating the funds of the Established Protestant Church to the education of the Popish population, we find somewhere about forty Roman Catholics. Now, do not let us be misunderstood—we do not blame them for this;—on the contrary, they act precisely as we should ourselves act under similar circumstances. Mr. O'Connell and his immediate parliamentary connexions may be violent and outrageous in their demands and desires; but as far as supporting Lord John Russell's motion—brought forward, cut, carved, and contrived for the very purpose of engaging that support—we see nothing in it but what is natural and just. It is the nature and the duty of a good Papist to maintain to the utmost of his power the rights and interests of the Roman Catholic Church. He is by nature, as well as by duty and on principle, the avowed enemy of Protestantism. He therefore acts naturally, dutifully, and upon principle, when he endeavours to secure to the people of his religion advantages derivable from the means of that which he hates and abjures. It is not only the violent political Roman Catholic who will decidedly support such a measure as this—the noble and the moderate Roman Catholic will equally maintain such a point. Witness the high and honourable names of Surrey, Howard, Talbot, Bellew, and others, who not factiously but conscientiously support the interests of their Church against that, which they, upon principle consider heretical.

Now it is, that it becomes necessary to look to the securities by which the privileges granted to Roman Catholic members of parliament have been restrained—securities upon which the Protestant people of England relied for protection from innovations upon their religion—for let it be under-

stood, the attack of Popery upon Protestantism will not, in its ulterior results, be confined to the Establishment. The *Standard* has twice during the week published the oath solemnly taken by Roman Catholic members on their admission to the House of Commons, and we follow the example, leaving it to the consciences of those gentlemen of that persuasion who voted in the division of Lord John Russell's motion, but more especially of those who have spoken on the question, to reconcile the eloquence of their language, the warmth of their sentiments, and the activity of their exertions, with the terms and conditions of the following solemn obligation:

"I do swear that I will defend to the utmost of my power the settlement of property within this realm, as established by the laws. And I do hereby disclaim, disavow, and solemnly adjure any intention to subvert the present Church Establishment, as settled by law within this realm, and I do solemnly swear, that I will never exercise any privilege to which I am, or may become entitled, to disturb or weaken the Protestant religion or Protestant government in this kingdom. And I do solemnly, in the presence of God profess, testify, and declare, that I do make the declaration and every part thereof in the plain and ordinary sense of the words of this oath, without any evasion, equivocation, or mental reservation whatever."

Having read this oath, we were about to inquire by what process its conditions could be enforced, or its violation punished; but we think we have discovered the loop-hole through which the conscientious Roman Catholic has crept out of its obligation upon the present occasion. He swears "solemnly never to exercise any privilege to which he is, or may become entitled, to disturb or weaken the Protestant religion or government in *this kingdom*." Upon which three words he will defend his exertions for the advancement of Popery and the undermining of Protestantism in *Ireland*—to which kingdom his earnest endeavours are as yet confined.

How this is to be reconciled with the concluding profession of the oath, it is not for us to determine—but this we know, that so nice are the distinctions made by the Roman Catholic priesthood in the great and holy cause, that we suspect no great difficulty would be interposed in the way of accommodating the consciences of those who are disposed to act upon the accidental substitution of one word for another.

## THE GREAT FOUR DAYS' DEBATE!

(From Cobbett's Register.)

MR. COBBETT makes the following remarks upon the great debate of the week, and its all-important subject, in a letter addressed to the people of Oldham. If the fulfilment shall be as tremendous as the prophecy, it will be seen, from what follows, that the inhabitants of this Debt-devoted country are far from being the most-to-be-envied nation of the earth.

"For three nights," says Mr. C., most grammatically, "I have *sitten* from half after four o'clock till past twelve, to listen to a debate on this most important subject; namely, whether the Parliament have the rightful power to take the proceeds of tithes from the Church and all its clergy, and to dispose of those proceeds unto any other purpose that it may choose. This is the real question upon which the House of Commons has been debating. The re-

RESOLUTION INTENDED of Lord John Russell goes on to express, that it would be right to dispose of the surplus, if there be any, of the Irish tithes for the purpose of general education of persons of all religions in Ireland. But, if the Parliament can dispose of tithes in this way, it can dispose of them in any other way; so that the only question is as to the right of Parliament to take away or alienate, what is called church property. It is my opinion that this right in the Parliament is undoubted. \* \* \* During this debate I have heard more *fine speaking*, and the promulgation of *more error*, than I ever before listened to in my life. \* \* \* It is a motion intended to displace the Ministers. And I beg you to observe, that as far as I am concerned, there is no such motive existing. You have not sent me here to make or unmake Ministers; you have sent me to protect your purse as far as I am able, and to cause your rights to be restored. I am sorry, therefore, that this motive is so manifest in the proposing of this resolution; I am sorry that the great principle in the resolution is inseparable from this the object of the resolution; but the principle is there; and I must vote for that principle; unless I be prepared to abandon every opinion that I have ever expressed to you upon the subject. \* \* \* The Whigs cannot carry on the affairs of the King, without yielding to what both factions term 'destructives.' I do not mean that they must take them into the Ministry; but I mean to say this, that let who will place themselves on the Treasury Bench, they cannot long sit there, and can never have one moment's security or peace there, UNLESS THEY GIVE THEIR ASSENT TO A GREAT LIGHTENING OF THE BURDENS OF THE PEOPLE. Now I beseech you to rely upon my judgment as to this matter. The church cannot stand as it is: the monstrous wrongs which its laws do to the Dissenters must be redressed. \* \* \* A lightening of the burdens of the people is absolutely necessary NOW, in order to give any Ministry time to breathe; time to consider of the changes necessary to be made in order to preserve this present form of government. It is a strange thing, but not more strange than true, that no men in power ever appear to perceive the influence, the irresistible influence of that SILENT public opinion which, in the end, determines every thing that is of great importance. Sir R. Peel, from a relying upon the savings and the votings of those immediately around him; relying upon the co-operation of the opposite party; scorned the opinion that a repeal of the malt-tax would tend to give him security; but I venture to say, and to assure you, that, if he had yielded upon that point, he never would have heard of this present resolution. It is very likely that my Lord John Russell never thought of that matter any more than Sir Robert Peel did; but if Sir Robert had yielded upon that point, the praises of him would have been heard from one end of the country to the other; and without any process of reasoning upon the subject, Lord John Russell would have FELT that he would not have had the countenance of the country in bringing forward any motion, the manifest object of which was to turn out of his place the Minister who had assented to the repeal of a tax so severely felt by ninety-nine hundredths of the people. If, therefore, he had assented to that repeal, and with a good grace, had not urged on the horrible Poor-law Bill, he would have had time to breathe as to all other matters. \* \* \* The enormous debt and taxation must produce a very great change in the affairs of this country, and in the mode of governing it. You see that the difficulties go on increasing; and be you assured that, to collect fifty millions of taxes

a year, with wheat at four or five shillings a bushel, must in a short time, produce a state of things in which it will be impossible for all the powers on earth to prevent the occurrence of events, such as I do not deem it prudent to describe to you. It is nonsense to talk of parties, and of majorities and minorities; here is a cause at work which is not to be resisted, and not be controlled in the smallest degree, by anything short of a total change in the fiscal and the pecuniary affairs of the country; short of that or of the immediate interposition of divine Providence itself. In your huddled-up situation, with your eyes necessarily fixed on your own affairs; with your attention constantly turned to mechanical operations, and to transactions and prices immediately connected with the effects of your wonderful ingenuity and industry, it is not easy for you to transfer that attention, however quick and docile your minds, so as to have a correct idea of the situation of the millions spread all over the kingdom, and dependent, whether in villages or towns, solely upon agriculture. But let me beg you to reflect for one moment, on what must inevitably be the ultimate consequence to the whole body of farmers, nine-tenths of whom are so notoriously in a state of insolvency; of millions of labourers and their families, to whom those farmers are unable to give food and clothing, in exchange for their labour, while the land is becoming barren for the want of that labour. Think of this for one moment, and you have too much sense not to know that your fate is inseparable from the fate of these millions: think of this for one moment; wait with patience; but be prepared to act the part which your sense and your virtue have induced you hitherto to act, when these causes shall have led to these events, which must finally come, with as much certainty as the hour of your and my death. \* \* \* *3d April, 3 o'clock, Morning.*—The division on Lord John Russell's motion relative to the appropriation of the Irish tithes has just taken place. \* \* \* It would be impossible with the little time that I have before me, to convey even a faint idea of the interest excited by the proceedings of the night. A very fine speech from Mr Sergeant Wilde during the evening. Mr. O'Connell, in not a very long, but very interesting speech, preceded Sir R. Peel. At last came he, with those talents of which a nation might be proud; and in the course of two hours did every thing which it appeared possible for man to do to resist the resolution. He felt that he was defeated; and that feeling was manifest throughout the whole of his long, most ingenuous, and most eloquent speech. There was in himself every thing which could merit success; but the circumstances were too hostilely powerful for him to control. Like the Rhodian sailors, in the storm, so beautifully described by Dryden, "From the first he laboured in despair." Under such circumstances it is beyond the power of mortal man to retain the fair use of all his talents; but, he did retain them to a very extraordinary degree even to the end. When he concluded his speech by telling us, explicitly: 'If you carry your resolution, I will oppose you in going into a committee; if you go into a committee, I will oppose you there: if you persevere in proposing your address to the King, I will oppose you there, I will oppose you at every stage in this proceeding; and if my opposition be unavailing, I will quit the situation in which his Majesty has done me the honour to place me; for I will not be the instrument for the carrying the principle of your resolution into effect.' For my own part, while it was impossible for me not to hear this with great approbation; not to admire this part of the conduct of the Minister, I cannot say that I did not hear these words with pleasure, as the announcement of

the approaching end of his power; for I had constantly in my mind the recollection of his attempt to enforce the Poor-law bill, and of his most injurious opposition to the repeal of the malt-tax: and now, are not my words already come true? If he had given way with regard to those most unpopular and odious measures, not only would he not have been defeated upon this occasion, but the motion of Lord J. Russell never would have been made. He seemed to think that he had 'public opinion' with him; and that the feeling out of the house did not correspond with the feeling within the house; and thus it is to be surrounded by flatterers. Never was error more gross in this world: the country is suffering in every limb and every fibre. Two hundred thousand insolvent farmers, and, perhaps, five hundred thousand insolvent tradesmen, will suffer no minister to be popular; will suffer no man to sit upon that bench for any length of time without passing some measure to relieve their distresses. If all the church bells had been set a-ringing on account of the repeal of the malt-tax, which they would have been; if his health had been drunk, by all the men with hard hands, never would he have heard of the motion of Lord John Russell. I am for a thorough church reform. My friends did not deem it prudent that I should say how much I wanted; but, if I had seen all the hard-handed fellows with pots of beer drinking his health, I should have taken especial care to postpone any thing that I had to propose about church reform, or Irish tithes, or any thing of the sort. \* \* \* The people are sulky, and very justly sulky: they see no hope of any relief of any sort: they naturally associate the Minister and the Ministry with the causes of their discontent. Placed in this state the attack upon him was sure to prevail; for, I repeat, for the thousandth time, I verily believe, that, under heaven this church of England and this aristocracy have nothing to rest any hope upon but the good will of the millions of the people of England. Now, then, will the Whigs come again? One would think that they had now seen enough to convince them that fifty millions of taxes a year, and wheat at four shillings and six-pence a bushel, cannot be pushed along. However, the chances are that my prediction of 1817, will be fulfilled, 'that there will be an everlasting chopping and changing of the ministry; that the whole system, military, civil, and fiscal, will be attempted to be carried on with unabated vigour and unabated suffering on the part of the people, till at last, amidst the war of opinions and of projects, of interests and of passions, the whole thing will go to pieces like a ship upon the rocks.'

### SMUGGLED CORN.

(From the Mark Lane Express.)

We have upon more than one occasion called the attention of the agriculturalists, and those whose duty it is to watch over their interests, to the importation of foreign grain and flour, duty free, through the Channel islands and from the Canadas. That such a system is carried on from Canada, we are fully convinced, and up to the present moment we felt equally satisfied that to a certain extent the same contraband trade had been carried on from Jersey and Guernsey. The statements made by the late President of the Board of Trade, and the apparent necessity for correcting the evil by a special act of

legislation manifested by notice of a Bill, founded on a report, to be brought in by that Hon. Gent. on the 15th instant, tended to confirm our apprehensions. A document entitled "Observations on a Report of the Commissioners of his Majesty's Customs, on the Corn Trade, in the Isle of Man and the Islands of Guernsey and Jersey," and emanating from the Deputies of those states now in London, put into our hands late on Saturday, has induced us at least to suspend our judgment, if not to altogether alter our previous view of the question. We regret that the pressing interest of Parliamentary matter has prevented our giving the "Observations &c.," in full, but we shall do so next week, and again advert to the subject. The charges contained in the "Observations" are of a serious nature, and we have no doubt will meet with the attention they deserve from the new President of the Board of Trade. It appears that a Mr. Weston had been employed by the Commissioners to go over and make the necessary inquiries as to the quantity of corn imported into the United Kingdom through the islands. This gentleman, after diligent investigation, reported that although it was the *opinion* of many persons that foreign corn had so found its way in, yet not a single instance could be adduced in which it could be substantiated, that such had distinctly been the case. Upon the information of Mr. Weston, as well as from information derived from other sources, the Commissioners made a report in which they state "that the amount of grain annually imported from Guernsey has exceeded the quantity grown in that island by 2,000 quarters, and that thence it is manifest a considerable portion of the wheat so exported, must consist of foreign wheat." The deputies in their "Observations," refer to page 3 of the report of the Commissioners, in which the annual quantity of grain exported to the United Kingdom is stated to be—

|                   | Wheat.     | Barley.  |
|-------------------|------------|----------|
| From Guernsey.... | 6,444 qrs. | 226 qrs. |
| Jersey .....      | 7,358      | 2,037    |
| Total ....        | 16,065     |          |

Whereas, the true statement, taken from Mr. Weston's own returns, at pages 10 and 12, is,

|                   | Wheat.   | Barley. |
|-------------------|----------|---------|
| From Guernsey.... | 539 qrs. | 86 qrs. |
| Jersey .....      | 1,611    | 1       |
| Total ....        | 2,237    |         |

Deducting then the amount as stated by Mr. Weston, from the previous amount stated by the Commissioners, it will leave an erroneous return against the two islands of 13,828 qrs. This error the Deputies state to have originated in reporting the *aggregate* amount of corn exported during five years, as the *average* annual exportation during that period. If this mistake has really been made it is of a nature so gross as to demand the attention of Government. We shall endeavour to enlighten ourselves further on the

matter before our next publication. The Channel islands must be considered as much a part of the United Kingdom as the county of Yorkshire, and we would protect their interests with as much earnestness, whilst we should at the same time most scrupulously guard against their obtaining any undue advantage.

#### THE NEW PREMIER.

(*From the Chronicle.*)

The *Standard* is somewhat unreasonable in demanding from Lord Melbourne that he should follow the example set by Sir Robert Peel on his return from Rome:—"Sir Robert, we are told, thought it but a due homage to the freedom of the country to announce in the most full, ingenuous, and explicit terms, the plan of his future Government, both as to what it should do, and what it should abstain from doing." The ingenuousness and explicitness of the Tamworth address and the Mansion-house speech are not so generally allowed as their craftiness. But however this may be, we would merely observe, that in the case of Sir Robert Peel it was absolutely necessary that he should explain to the nation how he, a Tory, and an opponent of the Reform Bill, could conduct the Government on Reform principles. The natural inference from the return of the Tories to office was, that they would conduct the Government on their own principles; and if Sir Robert had not told the country that he intended to give effect to Reform principles, the idea of such a thing would never have entered into any man's head. It would not, however, have answered the purpose of Sir Robert to appear in the character of a Tory; for, to have even a chance of obtaining a majority in the elections, it was necessary that he should supply renegade apostates and waverers with some pretext for joining him. The Tories would have supported the Peel-Wellington Ministry as a matter of course, and even more cordially, without Sir Robert's declaring himself a Conformer, but the object of the Right Honourable Baronet was to perplex the understandings of the weak, and to supply the unprincipled and the timid with something like a justification for what would otherwise have appeared a naked abandonment of principle. Lord Melbourne, on the other hand, has no principles to abandon, no explanations to offer, for appearing in a new character. The Peel-Wellington Ministry is merely an ugly episode in a Reform Government. His Lordship, with most of his old colleagues, proceeds in the course in which he was so unnecessarily and culpably interrupted in November last. He will give effect to the various reforms which the people are justified in expecting. They repose confidence in his administration; it is not necessary that he should issue manifestos to acquaint them with his abandonment of his former principles, or his reasons for adopting a different policy from that which they would naturally expect him to pursue. Our contemporary asks, "What pretext can Lord Melbourne offer for refusing to imitate the example set by Sir R. Peel?—the example set spontaneously and without invitation by the late Prime Minister?"

There is no refusal in the case. Sir Robert appeared in a new character, and explanation was both natural and necessary. Lord Melbourne has not changed his principles, and he thence natural-

ly supposes that no explanation is necessary. He will produce the measures which have been announced by Lord John Russell and Sir John Hobhouse, and these will be followed by others in due time. A Reform Minister has constantly present to his mind, that his dependence is on the good opinion of the people; and he will naturally be anxious to produce such measures as will promote their interests, and consequently merit their good opinion.

#### PLENIPO.

(*From the Globe.*)

We feel sure that Reformers of all denominations will unite in one chorus of exultation at Plenipo's easy victory of the Craven stakes. Indeed, next to the success of Lord Melbourne in forming an administration, the success of that celebrated horse has been the most prominent object of liberal solicitude; and the reason is obvious: Plenipo is emphatically a reform horse, and his adventures have borne a most curiously strict resemblance to the career of the reform administration. In the first place his size, his make, and capabilities presented the same magnificent superiority over the slender proportions of the old set of boroughmonger race-horses, as did the moral grandeur of the Reformers over the weakness of the old children of corruption. And then Plenipo was born the very year of the reform bill. Like the Reformers, for a long time he carried every thing before him, and his disasters began within a month of theirs. A trip to the north was alike fatal to both. Plenipo's fall was with good reason attributed to foul play. So was the fall of the liberal administration. On his return from the north, Mr. Batson turned Plenipo out; soon after their return from the north, their Royal Master turned out the Reformers. The winter rolled by, the spring approached, and within a week of each other these two events took place: Lord Melbourne's party carried the appropriation clause, and he was once more proclaimed premier of England, and Plenipo carried off the Craven Stakes, and was once more proclaimed premier of the turf. And there is this further coincidence in the two victories: Plenipo was opposed by Colonel Peel's "Nonsense," and Lord Melbourne was opposed by Sir Robert Peel's nonsense, and in both cases Peel and Nonsense were defeated.

A bright prospect is equally open now to Plenipo and the Reformers. We prognosticate with confidence a series of successes to both, and we trust that for many years to come we may be enabled to continue this glorious and faithful parallel.

#### THE NEW ADMINISTRATION.

(*From the Morning Post.*)

The accession of some of the leaders of the late opposition to power has, as usually happens in such cases, been attended by severe disappointments to many of those who have hitherto been among the most active and zealous retainers of the party. And, if we are correctly informed, the feelings incident to a disappointment of this nature are generally expressed upon the present occasion with considerably less of decorum and reserve than can be reconciled with the ordinary rules and habits of political society. A very little reflection upon the subject may suffice, however, to lead us to an adequate and very natural explana-

tion of a peculiarity which does honour neither to the complainants nor to the eminent persons whose partiality and ingratitude form the topic of angry animadversion or querulous remonstrance.

The whole system of opposition to the administration of Sir Robert Peel, from the first vote—by which the House of Commons determined to place in its chair that candidate who of the two presented to its choice had been in effect declared, by its own repeated votes, to be the less fitted for the situation—to the decisive vote by which it resolved to amalgamate two distinct and even conflicting measures into one, to blend the disputed and nicely balanced question of appropriation with a measure of public policy, the instant and urgent necessity of which no human being or any party in politics did or could affect to doubt—from the day on which parliament met, in short, to the moment when the late ministers announced their resignation, the entire course of the Whig and Radical opposition was dictated exclusively by a love of place, the most undisguised and the most intense that was ever exhibited by any political party or combination of parties in Great Britain. Why else incorporate into a measure of pressing and admitted necessity a contested principle, alien, if not repugnant, to its nature? Why else, by a series of votes not called for in the actual state of public business, and not requiring immediate decision, parade a majority composed of elements the most heterogeneous and discordant? Why else obstruct and embarrass the progress of legislative measures, the usefulness and value of which the conspirators never once ventured to call in question, by a series of motions, which those even who do not regard them as mischievous must admit were merely idle and vexatious. Why else put upon the records of the House of Commons vote after vote, to which no man throughout the country could ever attach any other meaning than this—"We have the power to force the present ministers out of office, and as we want their places that power shall not for a single moment lay dormant in our hands?"

Such as we thus describe having been the combining cement and the actuating motive of the late opposition in every step of their parliamentary proceedings since the commencement of the session, it can excite no surprise that individuals of the party who thought themselves entitled to office, and have not got it, should break through all ordinary rules of propriety or decency in the expression of their rage. The wonder, in such circumstances, would be if decency or propriety were in the slightest degree observed. Men cannot sell themselves very often. The traffickers are perfectly conscious that the commodity in which they deal is apt to acquire a taint, which utterly destroys its value. Hence it is that the non-payment of the purchase money in such transactions is of all offences the deepest and the most galling, and that the seller, who either is or believes himself to be defrauded, is sure to be of all human beings the most ferocious and ungovernable.

The above observations do not apply, it is fair to admit, or do not apply equally, to all the component parts of the confederacy by which the administration of Sir Robert Peel was driven from office. Mr. O'Connell and his immediate adherents had a motive for wishing the overthrow of the late administration, and the re-instatement of their competitors, independent of and superior to the desire of office. They wished very naturally that the administration should be essentially a base, grovelling, and sordid administration, an

administration in place merely for the love of place. This must, from their position, their character, and their objects, have been their first and foremost wish, and their second must have been that such an administration should be indebted to them for its entrance into office, and dependent upon them for the permanency of its official existence. The administration by which that of Sir Robert Peel must of necessity be succeeded was sure to fulfil both of these conditions. The first was effectually guaranteed by the course which the opposition had pursued. The second was guaranteed by the fact that, after deducting the Conservative members in the House of Commons, there is no party in that assembly which can hope for a majority upon any question without the aid of Mr. O'Connell and his crew. With a low grovelling, and sordid administration, intent upon place for the sake of place, and wholly indifferent to the interests of the country, and with such an administration dependent, as it must necessarily be, upon his support, for its existence from day to day, Mr. O'Connell knew that he should be able to work his will, without any obstruction from the executive government, and without any effectual obstruction in the House of Commons. The Melbourne ministry is precisely the ministry which Mr. O'Connell must have desired. For such a government and for no other, was it worth his while to conspire, to suppress his talents for debate, to ape humility, to retract or qualify all that he had said, protested or sworn. Why but for this conviction should Mr. O'Connell have identified himself with the Melbourne party, which he had denounced, vilified, and ridiculed without mercy six months ago? Why but that Mr. O'Connell saw, as everybody else saw, that if the Melbourne ministry returned to power now they would be wholly prostrate at his feet, whereas six months ago they possessed some independent power—some capability and will to make head against his authority? Why but for that, for his purposes, they are now a better administration than they were then, in precisely the same degree as they are a worse administration for the interests, the security, and the welfare of Great Britain?

To remove any doubt, if any doubt be entertained upon this subject, it is only necessary to cast a glance at the change of relative position which has taken place within the last six months between Mr. O'Connell and his party on the one side, and Lord Melbourne and his party on the other. At the former period they were sworn enemies; now we behold them fast and steadfast friends. It would be a contradiction in terms to affirm that this remarkable change of relative position has taken place between the parties, both of them continuing to occupy the ground which it occupied before. The single question, then, is, which of the two parties has changed its ground? Is there anybody who pretends that Mr. O'Connell and his party have changed their ground? Do they profess to have changed it? Is there any symptom that they have changed it? May not Mr. O'Connell take in his hand the King's speech, in which he was denounced, with the full approbation of Lord Melbourne, as an enemy of his country, and, reading the passage containing this denunciation, may he not boldly and proudly say, "Such as I was then I am at this moment. In character, feelings, objects, position, I am wholly unchanged. I am humoured, cherished, obeyed now, I was denounced then. Yet I, at least, am the same." This Mr. O'Connell might confidently say: and what, we again ask, could Lord Melbourne reply? What do

the people of England reply for him at this moment? They say that of all the members of his administration Lord Melbourne may be the least of a driveller, that he may be the least of a slave to Mr. O'Connell, that he may be the least of a traitor to his Sovereign and his country, but that when his present position in relation to Mr. O'Connell is compared with the position he formerly occupied, he is still a driveller, a traitor, and a slave.

It is in vain that Lord Melbourne protests there is no compact in existence between Mr. O'Connell and himself. Their relative positions amount to a compact more binding than the most express stipulations. Lord Melbourne is bound to be subservient to Mr. O'Connell under the heaviest penalty that can be imposed. Let him in the slightest degree fail in the duties of submission and obedience, and the whole fabric of ambition and venality which his friends in the House of Commons have reared at so vast an expense of character, and with so reckless a disregard to the safety and welfare of the state, must crumble in an instant into ruin, or be sustained, if sustained at all, by the generosity and the patriotism of the statesmen against whom, and against whose efforts in the service of the country, the conspiracy between the Melbourne and the O'Connell factions has been directed. In such circumstances what compact can be required? There needs no compact. There is no compact. There can be no compact. Who ever heard of a treaty between the slave and his master? And from the moment of his recent entrance into office Lord Melbourne assumes the badge, and bears the brand of bondage to Mr. O'Connell. The latter may indeed have granted terms. He may have assumed a moderation which is foreign to his nature to lure the men whom he designed to employ completely into his power. He may have fraudulently assigned a boundary to his own pretensions. But his terms will be found delusive; his moderation hypocrisy, the boundary to his pretensions such as to admit at his pleasure of an indefinite extension.

#### SIR R. PEEL'S ADMINISTRATION.

*(From the Morning Herald.)*

It is much easier to look back than to anticipate, and when events have been consummated, to point out how unfortunate results might have been avoided. Looking upon Sir Robert Peel, with one exception—the unfortunate question of the currency—to have been an almost faultless minister, we cannot contemplate his removal from office, especially in the circumstances in which it has taken place, to be any thing short of a national calamity. How that calamity might have been avoided it is now not difficult, we think, to see. The two events which have led to this untoward state of things, were, the too hasty dismissal of Lord Melbourne's first administration, and the premature dissolution of the late Parliament. With reference to the first of these we do not at all deny, but have all along contended, that there was sufficient in the state to which that ministry was reduced by the death of its principal member, by the eccentricities of another, by the secession of others, to justify an impression on the royal mind, that no patching up which it could undergo could enable it to carry on the affairs of the country with any prospect of success, and, therefore, with a promptness, a candour, and a manliness, not always to be met with in courts, the King at once deter-

mined to rid the country of an incubus, which his Majesty rightly enough imagined was on the eve of self-dissolution. Still events have proved that the act itself was premature, and that it gave to that ministry a renewed vitality, a certain degree of sympathy, on which it was fast losing all legitimate claim. In short, Lord Melbourne's government should have been allowed to die the natural death to which it was so fast approaching. The putting it out of its misery gave it the only new life it could ever have acquired. This done, however, and the new Premier placed at the head of affairs, it was not at all necessary or advisable that the Parliament should have been dissolved, till it had at least shown an equivocal disposition to thwart the new minister in his conduct of the public affairs; and such a course seems the more advisable now that it is seen what the measures of Sir Robert Peel have been. We apprehend the most sanguine among the Whig-Radicals does not imagine that if the dissolution had taken place in February, or March, instead of when it did, a very different result would not have ensued. In short, it was the obvious policy of the new ministry to place the House of Commons in the wrong before they returned them back upon the judgment of their constituents; whereas by a premature dissolution, by turning the members adrift, faultless and untried, a sympathy similar to that which the dismissed ministers were receiving was created towards them, while Sir Robert Peel and his colleagues at the same time placed themselves in a false position towards the country, by allowing it to be assumed and imagined that they meant to resort to anti-reform, instead of a reform policy, in their government of the country. We are not unaware of the arguments which present themselves on the other side; above all, of the inconvenience which would have arisen from so many of the members of the government being without seats in the House of Commons. But our view of the matter only amounts to a question of time, and as such the difficulties in this respect would have been but of short duration. We do not for a moment imagine that the late House of Commons would have suffered Sir Robert Peel's government to go on had his measures been those of an angel; but it is the factious opposition which, we believe, it would have received, which would have sealed its doom with the country, and had an effect upon numerous constituencies, who, in the absence of it, re-elected to the present house men whom they would in the other case, in all probability, have rejected. These are the views, this the conclusion, to which a retrospection of the last four months leads us to come to. If they are correct, then the inference almost necessarily follows, that had an opposite course on both occasions been pursued, the present state of things would have been widely different; and instead of seeing the affairs of the country delivered over to a ministry which, disguise it how they will, are mere puppets in the hand of one who avowedly holds the wires, we should have seen the most capable man in the kingdom manfully and judiciously wielding its destinies, supported by a majority of the representatives of the people, and enjoying the entire confidence of the other two estates of the realm.

THE CELEBRATED PONY HUNTER.

# THE FARMER'S MAGAZINE.

JUNE, 1835.

No. 6.]

[VOL. II.

## THE PONY HUNTER.—PLATE.

The extraordinary animal, whose portrait accompanies the present number, was the property of Mr. Coke (nephew of the gentleman of the same name, of Holkham) and was for some years a distinguished hunter in Leicestershire, particularly with the Quorndon-hounds when they were under the direction of Mr. Osbaldiston. From the circumstance of his being under fifteen hands, he was called the *Pony*, and under this diminutive appellation was sometimes seen leading the field, and always well advanced in front; but though he reached no higher when placed under the standard than about fourteen hands three inches, he possessed great power, (as the graphic representation testifies,) and being thorough bred, few horses could live with him after hounds. His colour chestnut, a hard pulling animal, and not remarkable for good temper. His owner refused seven hundred guineas for him. The celebrated Robin Put, the property of the late Sir Harry Goodricke, was a horse of a similar description, and a similar sum was offered for him.

Much has been written respecting horses used for following hounds, generally by those whose knowledge of the subject was so superlatively superficial, that, without any alarming stretch of imagination, it might have been supposed the foundation or basis of the twiddle-twaddle was gleaned from the loquacious nonsense of their grandmamma. In this way, the mind of Mr. John Lawrence must have been nurtured and trained, at least if our opinion is to be formed from the monthly miserable farragos, which a few years since appeared in the *Sporting Magazine*, as well as from his spurious clumsily manufactured tomes which have at various times crawled into existence. This gentleman never rode after hounds in his life; I am doubtful if he ever saw a pack of hounds, or knew a coley from a bloodhound? Yet did he appear as a public instructor upon every ramification of the chase with a degree of elastic self conceit, which gave the finishing touch to his egregious, his imperturbable, his unblushing ignorance. This wretched book manufacturer has been worthily, if not pre-eminently, succeeded by a scribbler in the pay of the self-elected "Society for the Diffusion of Useful Knowledge." In that part of the inordinate issues of manufactured rags put forth by the Society in question, called the *Library of Useful Knowledge*, appears some ill-digested, ill-arranged, and grossly-ignorant observations under "The Horse;" the author of which, or rather the manufacturer, may perhaps think my language

severe:—let him recollect, however, that, as a public writer, he is a legitimate subject of animadversion, through a similar instrumentality as that by which he contrived to appear in his motley magpie dress of black and white; further, since he has chosen to assume the office of public instructor without the requisite capacity, to lecture upon a subject of which he is profoundly ignorant, the exposition of imposture becomes a debt due to the public from the centinels of the press.

Passing over a most ridiculous, though a sort of sanctified, exordium; as well as some wordy verbiage respecting the Wild Horse and the Boots of the Gauchos; after ringing some scores of very untunable changes upon the varieties of the horse tribe, we at length arrive at the "*The Hunter*," ornamentally illustrated, in the first place, by a pictorial embellishment evidently copied from the sign of some country alehouse, and the subject is farther luminously illustrated with the following didactic apothegm:—"In strong thickly enclosed countries, the half-bred horse may get tolerably well along; but for general use the hunter should be at least three quarters bred (a sort of quadroom, I suppose?) perhaps seven-eighths. If he could be obtained with *bone enough*, and a *different action*, a thorough bred horse would form the best of all hunters." Whatever may be the effect of the lecturer's flowing oratory from the rostrum, or the presidential chair, the above quotation not only testifies his egregious ignorance of the business of the chase, but clearly shows that the nature or quality of the animal upon which he dates his professorship is very imperfectly understood by him; so much so indeed that he is evidently unaware that the action of the horse is the result of education; I will put his own case in a more lucid manner than he has presented it. He supposes, (he has perhaps been told,) that the race horse goes close to the ground, and that the action of the hunter should be more lofty; very good; such is the state of the case. But the writer in question, he who has constituted himself a public instructor, does not seem to be aware that from early life, the racer is thrown forward and taught to become a daisy cutter for the purpose of acquiring the utmost possible speed. "Train up a child," &c. "The proverb is rather musty;" thus as he is taught one system of progressive motion, and continues to be trained upon the same principle, he carries it to perfection if possible, to the exclusion of every other method. However, take the same animal, the thorough bred horse, the descendant of the little, beautiful, light, elastic Arabian, and train him to hunting, and he will acquire the requisite mode of going; if, instead of the smooth

velvet turf, he be trained across the inclosure, upon fallows, uneven, and all kinds of ground, he will not fail to substitute, for the daisy cutting action of the race horse, the loftier and more careful mode of going which distinguishes the accomplished hunter. Yet, the direct and conclusive reference to be drawn from the *instructive precepts* so forcibly fulminated for "*The Diffusion of Useful Knowledge*," is, that the action of the hunter is so unsuited to the form, the manner, matter, and motion of the thorough bred horse—so foreign indeed to his very nature and disposition, that his acquisition of it is utterly hopeless and impossible! Bah!

Had this highly enlightened and luminous demonstrator ever been in the hunting field—had he seen the Pony Hunter cross from Billesdon Coplow to Breedon Clouds, he must have altered his opinion as to the capacity of the thorough bred horse for elevating his fore feet. Had he visited Melton, he might have received the most conclusive ocular demonstration that thorough bred horses are not necessarily daisy cutters in a thousand instances; in fact, in Shropshire, Yorkshire, Cheshire, Warwickshire, Staffordshire, and indeed in all the hunting counties which I have lately visited, would have presented similar objects for his contemplative consideration; nor can anything short of full blood live with fox-hounds of the present day.

To talk about a "half-bred horse getting tolerably well along" is not the language of a sportsman, it is ridiculous nonsense; and the writer who presents such mawkish stuff to the public, particularly under the garb of a public instructor, is pre-eminently entitled to that reprehensive exposition, which it becomes our imperious duty to administer.

Again observes this spontaneous professor of "*Useful Knowledge*," the forehead should be loftier (in the hunter) than in the racer. A turf horse may be forgiven if his hind quarters rise an inch or two above his fore ones. His principal power is wanted from behind, and the very lowness of the forehead may throw more weight in front, and cause the whole machine to be more easily and speedily moved. A lofty forehead, however, is indispensable in the hunter; the shoulder as extensive as in the racer; as oblique and somewhat thicker." *En passant*, it will be an act of genuine and disinterested friendship to recommend this philosophical disciple of the seminary for the "*Diffusion of Useful Knowledge*" to study Lindley Murray's Grammar, as he is evidently unacquainted with the construction of the English language. But, as regards his comparison of the race horse and the hunter, to say nothing of the wretched verbiage in which his hobbling notions are so limpingly described, the comparison, if it can be allowed to amount to any thing, forms an absolute misprision. If, in the race horse, "the hind quarter should rise an inch or two above his fore ones," why should not a similar formation be equally applicable to the hunter? If, in the race, "his principal power is wanted from behind," surely the same observation may be applied more forcibly to the hunter; or how is the latter to make his way over a country, and in particular, to clear the fences, since, in the act of jumping, the impelling power must arise entirely, absolutely unassisted,

from the hind quarter? "A lofty forehead (says this accomplished declaimer) is indispensable in the hunter;" indeed! To which I beg leave to give the most positive, the most unqualified, contradiction. Further, I unhesitatingly state that a high forehead is directly opposed to the principles of power and speed, and that a horse thus formed, must necessarily be so slow, and so unable to get over the fences, that he would be run out of sight by modern fox-hounds in a very few minutes.

When a writer presumes to give instructions upon a subject which he does not understand, he can scarcely fail to flounder from one mistake to another: thus, in the present instance, after asserting that "a lofty forehead is indispensable in the hunter," the *Diffuser of Useful Knowledge* says, that the shoulder should be as "oblique" in the latter as in the racer; and so it certainly should: but then, he unfortunately did not recollect that a "lofty forehead" and an "oblique" shoulder are incompatible. Wherever the "oblique" shoulder is found, the "lofty forehead" cannot exist. To sum up in a few words: a horse to be powerful and swift should be well raised behind, with a great length of sweep, and much muscle in the hind quarter; his shoulders should be "oblique;" his chest low-dropping; and this form, or animal organization, is equally applicable to the quadrupedal exertions of the race course, or to those of the hunting field.

A horse that has been trained to the race course necessarily makes an awkward figure in his probationary hunting lessons; yet he learns to alter his mode of going in a much shorter time than might reasonably be expected. Tawpy, one of the best cocktails that ever appeared on the turf, after racing for several years, became a hunter, and carried Lord Wilton for several seasons. I saw his Lordship, mounted on this horse, go away with the Cheshire hounds from Waverton Gorse, and after crossing three fields, he charged a well known brook, the name of which, however, I do not at this moment recollect, and got clear over; many others attempted, and covering only part of the space, were content to receive the benefit of the bath, and make their way to one side or the other, as the case might be: but Lord Wilton was not the only person that landed firmly on the opposite bank: Lord Delamere, Sir H. Mainwaring, and several others were equally fortunate. I mention this circumstance in order to shew that a race horse may become a superior hunter. I saw Tawpy out many times, and he uniformly manifested a decided superiority in his performances: it may be said, perhaps, Lord Wilton is not a welter weight; but then, he rides long, and every inch below the girths I consider as equal to six extra pounds.

Mercury, another celebrated cocktail, became a hunter, and two years ago I saw him in the possession of Mr. Wicksted, who rode him after his own hounds, the Staffordshire: as a hunter he had a fault, he would not take water; a circumstance unpleasant enough, but which is no uncommon occurrence. Warrior, a celebrated hunter, rode for some years by the late Mr. Francis Bretherton, took water without hesitation for several seasons; but happening to fall short in one of his attempts over a wide brook, he was nearly drowned

before he could be got out, and would never face water afterwards.

The two cocktails mentioned above were unquestionably as thoroughly bred as possible, nor is there the least doubt that they raced under a fabricated pedigree. Indeed, it is not easy to define what is meant by full blood; that is, it is difficult to ascertain, in how many removes the impurity of the *black mare* is washed out by the genuine Arabian stream; nor can any doubt be entertained by those who have paid attention to such matters, that the taint would disappear sooner or later, according to circumstances—it might be manufactured into a curious zoological problem, which, however, no mathematical calculation could precisely demonstrate, and to which Sir Isaac Newton's doctrine of fluxions could be alone applied.

In going through a stable of hunters, it will frequently be observed, that such a horse is as nearly thorough bred as possible, which, on investigation, will be found to amount to this, that his sire was an acknowledged thorough-bred, but his dam, though some scores of removes perhaps from original impurity, had nevertheless a taint in her pedigree. A well practised eye is not easily deceived in regard to the degree of blood which the horse possesses; but one circumstance will uniformly place the matter beyond all doubt—if the animal can go through the exercise which is administered to the racer, and eat as much corn, no doubt can exist as to the genuine purity of his blood. In a distressing run with a fox, the basely bred creatures, though they may go well enough for a while, are always the first to tail off: thorough-breds alone live to the end of it. The best hunter I ever rode was by Champion, winner of the St. Leger, his dam was as nearly thorough-bred as possible, so at least said her owner, and when pressed upon the subject, he could only make out the remove by saying she was by a cocktail out of a thorough-bred mare; yet my hunter was said not to be thorough-bred. Two years since, when Sir Harry Mainwaring's hounds met at Tarvin, I noticed a horse upon which the first whip was mounted, he appeared as much like full blood as possible. Upon putting the question to the worthy baronet, he replied he was not thorough-bred, but had won a cocktail stake.

The hunter may be said to have been in a state of progressive improvement for the last century, as the kind of horse formerly used for the purpose, is rarely to be met with at the present day; and, even when seen, is no longer capable of maintaining a place with modern hounds. As the hound was rendered more fleet, it became necessary to increase the progressive motion of the horse also; so that, in a smart run with a fox, the old English hunter would be completely shaken off in a few minutes.

Sportsmen of the present day are of opinion, that, in the hunter, as much blood and bone as possible should be united; perfection in the horse intended for the hunting field may be thus acquired, and it can be accomplished in no other way. Yet, what we denominate blood is so anxiously desired, that the present maxim of the modern school is—an ounce of blood is worth a

pound of bone. I have heard it remarked, that small bone with large sinew or tendon is the union which gives to the animal possessing it, superior powers of speed and endurance; but such an assertion can never be the offspring of reason and reflection, since a formation of this kind is rarely, if ever met with; and, even where it may be found, inasmuch as it would form a sort of preternatural union, it would weaken, rather than add to, the powers of the animal which possessed it. Bone is the fundamental principle of strength; it is the substance to which the tendon is attached, and by which indeed, both it, and also the muscle are supported; and therefore the bone and tendon will be found for the most part, in just proportion.

Where much bone is seen, much tendon will be found also; and when it happens otherwise, I should consider it a mal-formation, a circumstance no way desirable, and consequently not to be recommended.

A notion is prevalent in the north western counties, as also in other parts of England, that Irish horses make the best hunters; and I am willing to acknowledge, that I have seen many, (and possessed some) excellent hunters which claimed an Irish nativity. But, since Irish horses are neither better bred, nor better formed, than English hunters, we must look for this superiority, if indeed they possess it, to some other cause, rather than the natural quality of the animal; and, on examination, it will be found to arise from the fearless manner in which they are ridden. A horse to become, and continue, a good hunter, must be boldly ridden; but I would have them at the same time, judiciously ridden also: in the latter quality our neighbours of the emerald isle are, in all probability, a little deficient; and hence so many of the Irish hunters will be found to have sustained injury. Many Irish hunters annually find their way into England, particularly through the port of Liverpool, few of which are free from blemish. In the field, they are (like their masters) very often impetuous and headstrong, owing to the mode in which they have been trained; but soon become tractable by a different method of treatment.

I had often been told of Irish horses clearing six feet walls, and this mentioned too as an ordinary occurrence: it seemed rather out of the common way to the notions of an English sportsman, and I was for some time doubtful of the accuracy of the report. The common height of a five bar gate will be found about four feet six or eight inches, which a hunter will clear very cleverly till he becomes distressed; but if the puff be taken out of him, it becomes an act of insanity to put him at, or expect him to cover such a jump. A wall four feet ten inches high may be justly considered a rasper, which, however, I have seen fairly cleared by an English hunter: still I was at a loss how to account for an Irish horse jumping "half a dozen six feet walls in succession!" I had seen Irish hunters jump the walls which sometimes are placed in the way of the English sportsman, and they managed the walls in the same manner as our horses, nor was I exactly aware of the mode in which the Irish nags got over the six feet walls, till a few years since, when out with the hounds of

Sir T. Stanley, I observed Ned Davis, the huntsman, put his horse (a powerful Irish horse) at a high wall: the animal approached it very deliberately, and, placing his fore feet on the top, thus drew himself over. I had frequently heard it remarked, that the Irish hunter *tipped* these high walls in going over, which I understood to be a touch with the hind feet; but the truth is, they touch or tip first with the fore feet, and drawing up their hind feet, place them on the spot which the fore feet had instantaneously quitted. Thus it would appear that a horse trained to this mode of getting over walls, would be able to jump (if jumping it can be called) any wall upon which he was able to place his fore feet.

When we consider the swift, laborious, and long continued exertion which a hunter is called upon to sustain, it is abundantly evident that his form and figure should constitute the essence, if possible, of strength and speed; and, therefore, after having met with an animal possessing a sufficient share of blood or breeding (thorough bred) for the purpose, the next object to be considered is his form, as indicative of the requisite qualities. A *knowing* dealer once remarked to me, that, in the choice of the hunter, the first point to be examined was the hock (he was shewing me a hunter he had for sale remarkable for the size of his hocks) as it was vain to expect any horse to make a good hunter, unless he possessed good hocks. This is all very well, and, beyond all question, a hunter cannot have a better recommendation than good hocks: there are, however, other points and circumstances to be considered; and, instead of the hock, I think it quite as well, like the celebrated Jock Buckle, deceased, to commence our observations at the fore feet. If there be such a malformation of the feet as to cause lameness, or to impede in any way the animal's motion: if, for instance, he was what is called *tender* (having the navicular disease) or foundered, all other qualities, however excellent, are rendered nugatory. It is true, a hunter with tender fore feet, as he goes principally on soft ground, will perform a day's hunting very well; but then, if the business should prove severe, which is very often the case with fox-hounds, the exertion which the horse has undergone produces inflammation or fever in the feet, he cannot feed on account of the pain which he endures, and will not be in a fit state to go out again for several weeks: consequently a horse with bad feet should be cautiously avoided.

Strength constitutes the most essential ingredient in the composition of the hunter; it is evident that a small or little horse cannot be well calculated for the purpose: yet there is a medium to be observed, and the extremes should be avoided. The extraordinary animal whose portrait accompanies the present number was low, but by no means a small or little horse; he was remarkably bulky, and so admirably formed for the business he pursued, his animal organization was so perfect an indication of power and speed, that look at him in all and any point, the eye became filled with his admirable and complete proportion.

Judging from long experience and a considerable field of observation, I have little hesitation in observing that, as a general standard, a hunter

should be about fifteen hands two inches high. This I would lay down as a general rule, subject to exceptions certainly, as will always be found the case. Great strength, as I have already observed, is indispensable in the hunter; and although the requisite strength will generally be found in the height I have just mentioned, yet sometimes it happens that horses of extraordinary power are to be met with considerably under that standard—of which the pony hunter is the most remarkable instance that ever fell under my observation. A grey entire horse which I saw in Leicestershire a few years since, which belonged to Sir John Lister Kaye, may be placed in the same class.

But the old hacknied observation, that a large horse will "*tire himself—his own weight will kill him*," is founded upon erroneous notions, and is consequently incorrect: it arose no doubt at a period of the old school of hunting, when the superiority of the genuine Arab blood was not well understood: and therefore, however applicable such an adage might be in days of yore, its force and truth evaporated with the explosion of the system in which it originated. It may be justly remarked, that a horse cannot be too large, if his conformation be correct, and above all, if he possess sufficient blood. On the 13th of November, 1833, I had the pleasure of going through Mr. Little Gilmour's stable at Melton, which contained ten hunters. The first which attracted my particular attention, was Snow-drop, a very handsome, a very powerful, and a very well bred grey gelding; a trifle more than sixteen hands high; an animal well calculated to carry his master, who rides at least fifteen stone, over Leicestershire. Next to him stood Mark Antony, a chestnut horse of great power and size. But when the groom had stripped Vingt-un, I was very much surprised on going up to him; he was altogether the largest and most powerful hunter I ever had an opportunity of closely examining; he was near seventeen hands high, with bone in proportion: I never felt better legs: thorough bred; and acknowledged to be equal, if not superior, to any horse in Leicestershire for crossing a country: eight hundred guineas were offered, but refused, for him. In the next stall stood Plunder, another very powerful bay gelding, as high, and as large, and I thought handsomer, than Vingt-un. They were two very extraordinary animals, whose performances clearly prove the erroneousness of the notion which was very prevalent some years ago, namely, that a large horse cannot last; since the performance of these two animals in the field (and I repeatedly witnessed them) were equal to their appearance in the stable.

Next to Plunder stood Bramah, sixteen hands one inch; Crispin followed in succession, about the same size: however, neither the deity nor the cordwainer was equal in size, power, or beauty, to their predecessors. Not a horse in the stable was under sixteen hands, all remarkable for power, breeding, and performance. A chestnut horse, which a few weeks after I saw at Shrewsbury belonging to Mr. Wynne, was of a similar description. If the form be good, and the breeding sufficiently high, a horse cannot be too large.

If we duly consider the principles of progressive motion, in reference at least to quadrupeds, and particularly to such animals as are remarkable for the celerity of their motions, we shall perceive that the fleetest of them are peculiarly calculated for speed by a combination of parts which is truly surprising, almost, as it were, in a mechanical point of view. Animals of the deer tribe are remarkable for the light, bounding elasticity of their motions, and their extraordinary speed; and their form, or animal organization will be found, on examination, admirably calculated for the purpose: they are much lower before than behind; their fore legs are short in proportion to their hind legs; and their bodies so formed that the viscera are placed forward, thus leaving a great scope for the free and extensive action of the hind legs, which of course are mainly instrumental in giving an increased impetus to the animal's progressive motion. Pursuing the same train of reasoning, let us next regard the greyhound, which offers a further and stronger confirmation of the hypothesis: the greyhound is smaller than the stag but swifter; and this superior speed arises, beyond all question, from the superior combination of his form; and if those who feel sufficiently interested in the investigation, will take the trouble to examine, they will find those greyhounds which have pre-eminently distinguished themselves, (such as the celebrated Carina, Claret, Snowball, and Major,) have been equally remarkable for a low-dropping chest, an uncommon length of hind legs, and commensurate space of their sweeping action from behind. The most striking exemplification, however, of the superiority of the principle of power and speed of which I have been speaking, of that combination of form, or animal conformation, calculated, above all others, to give celerity to quadrupedal progressive motion, as well as for maintaining it, is to be found in the hare: beyond all comparison, the fleetest quadruped in nature, when her size is taken into consideration. The hare is generally found to weigh from six or seven to ten or eleven pounds, though hares rarely reach the latter weight. Yet the hare is swifter than the stag, whose weight amounts to twenty times as much as that of the hare: she is as fleet, if not fleetier, than the greyhound, notwithstanding her diminutive form compared to that of her pursuer. Whence then arises this extraordinary strength—this wonderful celerity of motion? We must look for the cause in the striking peculiarity of her conformation. If any person will take the trouble to examine this little creature attentively, they will not fail to be surprised at the very great difference in the length of her fore and hind legs, at the oblique direction of the shoulder, and the wonderful manner in which her quarters are inserted, as it were, into the body; the amazing strength of her loins, her depth of chest, the absence of heavy viscera in the posterior part of the abdomen. From such a peculiar structure or formation, she derives a stride equal to that of the greyhound, uncommon strength, and an unrivalled celerity of motion.

Therefore, in the choice or purchase of a hunter, this hypothesis, these principles of power and speed, should be kept steadily in view. The horse is slower in comparison than either the

stag, the greyhound, or the hare; and this must always be the case, since it would be ridiculous to suppose that a horse could be met with formed precisely in the same manner as the animals just enumerated; but, in making our selection for the purpose of the chase, our choice should be regulated upon the same principle. If we have recourse to the most distinguished racers which have ever appeared on the turf, for a proof of the correctness of the principle inculcated, we shall find it amply confirmed in Eclipse, Flying Childers, Shark, Firetail, Lottery, Longwaist, Velocipede, and, above all, in Plenipo; and I hesitate not to assert, that the qualities calculated to attain pre-eminence on the turf are equally so to acquire distinction in the hunting-field: the powers must be the same, the difference results from their application.

However, let it not be forgotten, that a horse with a superior conformation for progressive motion (such as I have endeavoured to describe) is said not to be handsome by superficial observers; but it should be recollected that *beauty* is a term which, in most cases, must be applied relatively: a horse may be very beautiful as a hunter, without impressing upon the mind the idea of a beautiful hack; and, therefore, the form of the horse which we are to consider under the present head, is that best calculated for following hounds. As a hunter has to traverse spaces where jumping as well as galloping becomes indispensably requisite, the animal for this purpose should present a combination of parts suited for the double purpose. It has been already shown that speed mainly results from the strength of the hind quarters; so, on examination it will be found, that it requires more than ordinary power in the same parts to enable a horse to clear his fences in superior style, and thus to become distinguished as a hunter.

I have frequently heard it asserted that the act of jumping (*leaping*, according to the phraseology of the old school), is nothing more than an elongation of the gallop; or in other words, that jumping is merely the extension of the gallop. But this is a mistake. In the act of jumping, the horse throws himself from the ground; all his feet completely leave it, which is not the case in galloping.

In jumping the spring must arise altogether from the hind quarters; and, therefore, in a hunter, I should not only look for strong hocks, but long muscular thighs, wide spread quarters, and loins as strong as possible; moderately ribbed up; rather round than narrow in the barrel; back not too low; low dropping chest; bony and muscular in the arm; strong knee, short from the knee to the foot; strong oblique shoulders, not too fine at the top; if the neck be well set into the shoulders and finely formed, the head well set on and handsome, so much the better; such a formation contributes much on the score of beauty, and cannot operate as a drawback on the essential qualities of the animal; a bold, full, clear eye; broad rather than narrow forehead; nostrils wide. Horses, whose shoulders taper very finely to the top, are apt to become foundered, though I have seen many excellent hunters of this description.

A hunter should stand over a considerable space: he should stand straight also, turn out his toes neither behind nor before. It will frequently happen that a short-backed horse will stand over a considerable space, owing to the oblique position of his shoulders, and his quarter being well set in: horses of this formation are well calculated for the business of hunting. A leggy horse cannot be recommended for the chase: a hunter, to use the words of Tom Hewitt, the dealer, (and few men can form so good an opinion), should "*grow down to the ground.*"

"On my little blood hack, dirt and danger defying

To cover I rattle, in hopes of a run;

There fit my cares, as the summer dews flying

Vanish away from the face of the sun.

Yes, the hunt are all met, and the country is famous;

The wind in the south too, the scent should be good;

'Come, Philip, now give us a gallop to tame us,'

'We will if we can, Sir,'—'Hike into the wood.'

Not a skirter among them, but crash they go in it;

'Hark! Concubine's speaking—yoicks! Concubine!

hark!

Stand steady, don't head him; he'll break in a minute;

Tally ho! there's a halloo! he's off for the park!

Now the pack in full cry, yonder lawn streaming over,

See! the deer stand and gaze at the gallant array!

Puss steals from her form at the edge of the cover,

Where pheasants keep rising and whirling away.

'Gone away!' in sad earnest the purls are commencing—

Here a farmer and steed most promiscuously roll;

There a Leicestershire blade on a glutton for fencing,

Takes a bull finch and breaks a buck's neck in a hole.

'My lad! pull that stake out—whoey! gently; ad rat it,

(While the mare's in a fidget, the man's in a fright;)

Do just stand aside, Sir, and let me come at it'

'Forward! forward! my boys! he's away to the right!

Now across a stiff country Sir Renard's departing,

The virtue of some of his followers fails

While steeds who went off furious rampant at starting

Have soon scarce a member to wag but their tails.

Now they make for yon osiers—he's taken the river;

'See! Conqueror foremost to plunge in the tide;

Slap dash in we gallop, nor care for a shiver

Where landing is safe on the opposite side.

'Hold hark! give 'em time to make out where he went.

here,

See the vet'rans eagerly press through the throng.

Yoicks! Countess and Hesperus carrying the scent there,

Who says that these gallants cannot go along?

For yon village he makes, but no cunning can save him;

Now sneaks through the homestead in pitiful state

Ev'ry effort is over! they view him! they have him!

'Who-hoop! lads, surrounded, he yields to his fate!

Tho' the life blood of beauty with terror may curdle,

While brooding o'er risks which the sportsman must run,

Now imagine him lying in state on a hurdle,

And turns but with sighs from the trophies he's won:

Yet when England at tyrants would level defiance,

Say, what makes her sons undauntedly bleed?

'Tis the chase—'tis the study of this noble science

Gives spirit and vigor and health to the breed.'

THE SENTINEL WASP.—Some writers have doubted the assertion that a sentinel is placed at the entrance of the nest as soon as the wasps retire to rest in the evening; but I can state most positively that I have never seen a nest of either species, after about nine o'clock in the summer months, without observing the sentry at his post; and it is curious to see with what rapidity the alarm is conveyed to those within when any attempt is made to meddle with him. I have sometimes thought that I could see a second sentinel at some distance behind the outer one; and, judging from the usual distance from the entrance down to the nest (often from two to three feet) and the quickness of the communication with it, there may even be more. A lantern held near

the sentinel does not seem to give him any alarm; but on touching the ground near him, he instantly disappears for a few seconds, and the inhabitants sally out immediately. I always capture the sentinel before proceeding to take the nest, and they are invariably neuters. A considerable number of wasps pass the night upon the outside of the tree nest in warm weather, but the sentinel is always to be seen at the entrance notwithstanding. It may be as well to mention, that in the ground nests there are two apertures, one for entrance, and the other for exit,—The tree nest has usually only one, near the bottom; but in large colonies a second is often added, in which case there is a sentinel stationed at each. There is a curious fact with regard to wasps, which, though already published, it may be worth while to mention, as I have had many opportunities of verifying it from experience; viz. that if the entrance to the nest be stopped up in the day time, the hundreds of wasps which are constantly returning to it make no attempt to sting the aggressor; but if one escape from the inside, it attacks him instantly, though not with the pertinacity of the common bee. I have often suffocated the wasps in a nest with a mixture of gunpowder and sulphur in the day time, and proceeded to dig them out directly, whilst hundreds were flying about me in all directions, but I have hitherto escaped with impunity. If a common quart bottle, half full of water, is placed in the cavity, and the ground levelled up again, so that the mouth of the bottle may as nearly as possible occupy the place of the former entrance, all the wasps that were absent at the time of the taking of the nest will crowd into the bottle during the day; and I have usually found from 500 or 1500 wasps captured in it on the following morning. It is interesting to observe the young wasps eat their way through the covering of the cells when their transformation is complete. This they will continue to do for several days after the nest is taken, particularly if kept in a warm place.—*Rev. E. Bigge's Treatise.*

#### OBSERVATIONS ON A REPORT OF THE COMMISSIONERS OF HIS MAJESTY'S CUSTOMS ON THE CORN TRADE IN THE ISLE OF MAN, AND THE ISLANDS OF GUERNSEY AND JERSEY.

This report was ordered by the House of Commons to be printed on the 23d March, 1835. Notice was given by Mr. Baring, President of the Board of Trade, of a bill, founded on that report, to be brought in on Tuesday 14th April.

Before that time, the Channel Islands felt considerable alarm and excitement at the groundless charges preferred against them, and at the projected invasion of their rights. They named deputies to defend those rights, and the deputies from Jersey, arriving first in London, discovered the fallacious nature of the report, represented it to the board of trade, and communicated the same to the deputy from Guernsey. He, with the advice of the said deputies, wrote immediately to the right hon. the secretary of state, to solicit the protection of his Majesty's Government.

The deputies rely on that protection; and whatever may be the wishes and attempts of interested parties, they know it to be impossible that any government should lend its influence to the adoption of legislative measures injurious to any part of his Majesty's dominions, when known to be grounded on a misstatement.

*The deputies are ready to prove the grossest errors in the report; they can do so by means of the report itself. The quantities of corn exported from the Channel Islands to Great Britain are so very insignificant, that ridicule must have attached to any attempt to legislate on that ground; even, when erroneously magnified, as they are in the report, the amount would not warrant interference; it is only the proof of fraud that could do so. And that proof is attempted to be established by representing the quantity exported from Guernsey as exceeding by one half the whole quantity grown. No legislative interference or prohibition could be too strong for such a fraud. We deny its existence, we solemnly protest against the charge, and by this appeal to men of all parties who still prefer truth, justice, and fair play to party views of any question, we are anxious to remove the false impression left on the minds of those members to whom the report has been distributed, and to rescue the character of our country so cruelly, so unjustifiably aspersed.*

To every man able and willing to investigate the question, it will appear that on the score of fraud there is not even a shadow of suspicion; and on the quantity exported from the islands to Great Britain, proved to be so very insignificant, that a legislative measure is totally uncalled for. *De minimis non curat Lex.*

For the assistance of those who examine the report of the commissioners of customs, we beg leave to refer them to page three of that report, where the annual quantity of grain exported to the United Kingdom is stated to be—

|                   | Wheat.    | Barley.  |
|-------------------|-----------|----------|
| From Guernsey.... | 6444 qrs. | 226 qrs. |
| Jersey .....      | 7358      | 2037     |

Whereas the true statement, taken from W. Weston's own returns at pages 10 and 12, is—

|               | Wheat. | Barley. | Report. | Real Export. |
|---------------|--------|---------|---------|--------------|
| From Guernsey | 539    | 86      | 6444    | 539          |
| Jersey        | 1611   | 1       | 7358    | 1611         |
|               |        |         | 226     | 86           |
|               |        |         | 2037    | 1            |
|               |        |         | 16065   | 2237         |
|               |        |         | 2237    |              |
|               |        |         | 13,828  |              |

Being an erroneous return of 13,828 qrs. against the two islands, instead of the correct average of five years, amounting for the two islands to 2237 qrs exported. Or the produce of an estate of seven hundred, or seven hundred and fifty acres.

(Signed) T. LE BRETON, } Deputies of the  
J. LE COUTEUR, } States of Jersey.

Colonnade Hotel,  
16th April, 1835.

DANIEL DE LISLE BROCK.  
Deputy of the States of Guernsey.

Colonnade Hotel, Charles Street,  
9th April, 1835.

Sir,—Whenever absent from my post in Guernsey, it is my duty to communicate to you the cause officially. In the present case the states of that island have deputed me to London to watch over the rights and interests of the inhabitants, and I have the honour to solicit for them your protection, and that of his Majesty's Government.

Such protection was never more required than at this time, when notice has been given by the president of the board of trade of a bill tending to de-

prive the Islands of their undoubted rights, and when that notice has been preceded by assertions in the public prints attributed to the same high authority, that the proofs of fraud from Guernsey in the exportation of corn were indisputable.

My motive, in accepting the trust reposed in me by the states, was to examine and refute those assertions: many gentlemen were better qualified than I was, by their ability and knowledge, to discuss the merits of the question; but having had from my situation the making out of the returns, the passing of the certificates of produce, having, I may say, followed the whole process of cultivation and shipment of the corn exported, no other man could speak with the same precision to the facts of the case. It may well be supposed that, on my arrival here last night, I was extremely anxious to discover the grounds of the imputation alleged against us. The report of the commissioners of customs, ordered by the House of Commons to be printed on the 23d March, 1835, was however only put into my hands this morning by the deputies of Jersey, who had themselves just discovered the extraordinary circumstances connected with that report, which it is my duty, sir, to lay before you. The annual quantity of wheat grown in Guernsey is stated at 4505 quarters, and the quantity exported to the United Kingdom at 6444 quarters; after which the report is made to observe—"Thus it would appear that the quantity of wheat annually exported from Guernsey to the United Kingdom has exceeded the quantity grown in the island by upwards of 2000 quarters, and it is manifest, therefore, that a considerable portion of the wheat so exported has consisted of foreign wheat; and the only way in which the fraud could have been effected has been by the exporters making false declarations as to the produce of the wheat.

A false view of the growth and exportation of corn is taken in a similar manner with respect to Jersey and on these false views the report proceeds throughout. It is clear that the aggregate amount of the corn exported for five years has been mistaken, and represented as the average of the annual exportation during that period. If the error had been confined to one table, and to one island, it would naturally be ascribed to accident; but where the error is repeated for both islands, and the whole of the argument against them is grounded on such double error it bears a mysterious appearance difficult to be accounted for, since the subsequent tables were of a nature to remove all doubts on the subject. Those tables prove, not that 6444 quarters were annually exported from Guernsey; not that the exportation exceeded by 2000 quarters the amount of all the corn grown; but truly and simply, that out of 4505 quarters grown annually, the average exportation had amounted annually to 539 quarters.

The commissioners have been much more ready to accuse the Island of fraud than they were warranted to be; for independently of their own gross and manifested error already noticed, by which the whole country have imbibed unfounded prejudices against us, they refer to the letters they had received from Mr. Weston, a very intelligent officer, whom they had sent from Weymouth to investigate the matter: and he says, that in prosecuting his "inquiries, it appeared to be the opinion of those with whom he had an opportunity of conversing, that foreign corn had so found its way into the United Kingdom, although a single instance could not be adduced in which it could be substantiated, or even a surmise as to its probable extent, and after a strict inquiry and a close investigation of the means which must have been resorted

to by those engaged in this species of fraud, I am fully satisfied that it cannot have been carried on to any extent."

And farther Mr. Weston adds—"But on no occasion could I discover rents so paid had ever been exported as of island produce, the Royal Court, by their practice, strenuously opposing any infringement of their privileges; an instance of which was brought before me by an officer of the Court, subsequently corroborated by others, of an individual who had purchased a quantity of tithe corn, not being allowed to swear to its produce so as to entitle him to its free exportation into Great Britain, as the practice of the Royal Court, in requiring in each case the oath of the grower, could not be dispensed with." And yet in the face of such a letter, the commissioners do not scruple to accuse the Island of fraud. Mr. Weston does indeed say that it was the opinion of some that foreign corn had found its way into the United Kingdom. If the opinion of the agricultural electors all over England were asked, they would probably say the same thing, and it would be found, as Mr. Weston found in Guernsey after a strict inquiry, that not a single instance could be adduced, or substantiated.

Is it upon such grounds that persons or communities shall be deprived of their rights; and are those possessing the largest masses of property ready to give such an example of disregard to the rights of property and the first principles of civilized society by trampling, in the confidence of their strength, on the rights and property of the weak, although held by titles as valid and as sacred as the richest individual can exhibit for his own wealth?

It has been shown, from the tables in the report, that the quantity of corn exported from Guernsey to the United Kingdom is only 539 quarters. Shall such a quantity be a sufficient ground for legislation—much less for spoliation? Let us suppose a case of modern date, that of the Mauritius annexed to the British Crown by the last treaty of peace, under the compact that her colonial produce should be admitted into the United Kingdom on the same terms as the produce of Jamaica. Would England be justified in breaking that compact because of the complaints or prejudices of the Jamaica planters? Our compact with England in its origin still more sacred, has been ratified not by one treaty, but by every treaty of peace concluded since the conquest, every war that preceded such a peace having been marked by our devotion and loyalty to the British Crown, and by the performance, therefore, on our side, of the conditions under which the compact was formed, and has since been held.

It is unfortunately true, that the agricultural interest is depressed. It is wrong, it is ridiculous to ascribe any part of that depression to the Channel Islands. The four islands do not contain twenty-five thousand acres fit for cultivation—meadows, orchards, and gardens included. How can this, with any man of reflection, be held up as an object of jealousy to the landholders, many of whom are owners of estates to a larger extent! Our connexion with England can indeed in no way be injurious to her; her commodities, produce, and manufactures are freely admitted, to an amount exceeding tenfold the value of our produce which she so reluctantly takes in return. The trifling quantity of corn exported from the Islands, and which the commissioners of customs cannot make to be more than 2151 quarters of wheat and 86½ quarters of barley annually from all the Islands, on the average of five years, is not sufficient to feed one half, or any thing like one half of the persons employed in Eng-

land for the supply of the Islands. England trades with no part of the world so advantageously as with the Islands in proportion to their extent. The goods exported by her to the Islands amount to at least £500,000, while the produce she takes back does not amount to £120,000—must we receive all and send nothing back? Such a system is too barbarous for the nineteenth century, and how it could enter into the thoughts of those specially appointed for the encouragement of trade is inconceivable. Some persons are disposed to account for it by reasons unconnected with trade, and dependent only on local and agricultural prejudices; if so, it is in vain to argue: and all I must say is, that I cannot think it possible that any statesman should be found, in this country, ready to sacrifice the rights and interests of the smallest community, for the purpose of flattering such prejudices, and should venture to do so, because the community injured is weak and helpless.

Confident in the justice of our cause, and in the honour as well as justice of His Majesty's Government,

I have the honour to be, Sir,

Your most obedient and most humble servant,

(Signed) DANIEL DE LISLE BROCK,  
*Bailiff of Guernsey.*  
*The Right Honourable Henry Goulbourn,*  
*&c. &c.*

Tavistock Hotel, Covent Garden,

April 14, 1835.

My Lord,—We feel it to be our duty to call the attention of your Lordship to some very important errors contained in the Report of the Commissioners of his Majesty's Customs respecting the corn trade in the Isle of Man, including also the Islands of Guernsey and Jersey, dated 29th July, 1834.

The Commissioners, in page 3 of that report, say—"From the best information we have been enabled to obtain, it would appear that the annual quantity of grain grown in Guernsey and Jersey is as follows:—

|                | Wheat. | Barley. |
|----------------|--------|---------|
|                | Qrs.   | Qrs.    |
| Guernsey . . . | 4595   | 3789    |
| Jersey . . .   | 10347  | 2897    |

The above amount, as far as relates to Guernsey, is correctly stated, but we have to complain that the same accuracy does not exist in the statement of the average for Jersey, which is taken from an abstract (page 15), made from a return (page 14), signed by Major-General Thornton, showing the proportion of land then under cultivation of wheat and barley; the average produce per acre, and the total quantity of wheat and barley at that average which the island may be expected to produce from the crop of 1834. This document, which, if complete, would be underserving of attention, unless no other means of procuring correct information could be found, is very imperfect, as appears by the return itself, wherein it is said "that no statement of ground under cultivation had been received from the parishes of St. Laurens and St. Helier." Thus two very fertile parishes are entirely omitted from the calculation, the produce of which amounted in the year 1833 to 2093 quarters of wheat and 451 quarters of barley. The difference between the estimated and the real produce will be fully accounted for when it is considered that the estimated average produce of a vergée is stated at only thirty cabots, when it is a well-known fact that good lands yield generally forty, and those of an inferior description seldom less than thirty cabots per vergée. We cannot understand how the Commissioners, in their report to the Board of Trade, could have

been induced to take the average produce of the Island of Jersey, from this evidently incorrect and incomplete return, rather than from an authentic document prepared by a Committee of the States, the accuracy of which is unquestionable. This return (page 10) proves the average for five years, from 1829 to 1833, to be annually 12,499 quarters of wheat and 3227 quarters of barley, instead of 10,347 quarters of wheat and 2,897 quarters of barley, as stated in the report, thereby erroneously representing the annual produce of Jersey in corn, as less by 2,152 quarters of wheat and 330 quarters of barley. than is really the case.

We also beg to bring under your notice another extraordinary error in the report (page 3), where the annual quantity of grain exported to the United Kingdom is stated as follows:—

|              | Wheat. | Barley. |
|--------------|--------|---------|
|              | Qrs.   | Qrs.    |
| Jersey . . . | 7358   | 2037    |

We are unable to discover the source whence this amount has been obtained. It is, however, correctly stated by Mr. Weston, in another part of the report (page 10), to be, wheat, 1,611; barley, 1. It is therefore quite clear that no reliance can be placed upon a report containing such a variety of palpable misstatements.

We also consider ourselves bound to protest against the reasoning and conclusions of the Commissioners of his Majesty's Customs, who, without any just or sufficient grounds, assume that frauds have been committed in Jersey, similar to those with which they charge Guernsey, although Mr. Weston, in his communication to them, says—"I could not obtain any proof of the fact, or the slightest information by which it could be corroborated."

It is not now our intention to prove, as we have the means of doing, that the measure proposed to be submitted to parliament would be a direct infringement of the rights of his Majesty's subjects, inhabitants of Jersey, and a violation of the charters and immunities granted and confirmed to them by a long line of Kings. We reserve for a future occasion the particulars of these privileges, and the foundation on which they rest.

We request, on behalf of the people of Jersey, whom we represent, that a measure founded on a report, manifestly erroneous and deceptive, may not be precipitately carried, and thereby irreparable mischief done to our Island. We trust that such a postponement as may allow of correct information being obtained and considered by the members of the British legislature will be granted to us; feeling convinced that his Majesty's Government cannot desire to proceed upon a statement so fallacious as that which is alleged to be the ground of the intended Bill.

We have the honour to be,

Your Lordship's

(Signed) Most obedient humble servants,  
THOMAS LE BRETON } Deputies of the  
J. L. COUTEUR } States of Jersey.

To the Right Honourable  
The President of the Board of Trade,  
&c. &c. &c.

**SEA KAIL BEET.**—In the culture of the common garden spinach, according to Loudon, at least twenty different sowings in one year are required to keep a constant supply; and even with all this trouble, every gardener knows that he cannot depend on having a crop, especially if the weather be dry and hot, owing to the tendency of the plant to run

into seed. All this superfluous labour, and the uncertainty of the result, may be spared by growing the Sea Kail Beet, a vegetable, though little known at present, yet well worth the attention of every gentleman and cottager who owns the luxury of a garden. The plant may be sown in March or April; and will yield an abundant and unfailing supply till Christmas. Such is the size of the leaves, that one dozen will serve a large table; the stalk of the leaf is an excellent substitute for Sea Kail, and the upper part for spinach.

## TO THE EDITOR OF THE "FARMER'S MAGAZINE."

Sir,—I was glad to see "Cymro's" remarks on the Malt question, and observations on Sir R. Peel's speech. The reason why less malt was made in 1816-17, and after: other wet harvests, arose from the farmers and labourers using sprouted barley in lieu of malt: *the labourers pray for a wet barley harvest; they were then enabled to brew*, and the farmers are rather benefited than injured if they store half dry.

It is estimated that we grow one-quarter more barley than is required for malting and seed. Allowing that six millions of quarters are thus consumed, there remains  $1\frac{1}{2}$  millions for feeding swine and cattle; if we were allowed to malt inferior barley one million might be used in feeding cattle; and if, (as it is admitted), that malting increase its nutritive quality, one-third such barley being worth but 24s per qr., would be worth 36s per qr., and thus increase the farmer's interests for *this portion* of their crop. A crop of 30 bushels, at 3s, gives 4l 10s per acre, but if malted for feed, 6l per acre, being 30s per acre, or equal to the rent, tithe, and rates, cattle would have been fed at 8s per week instead of 12s per week on oil-cakes.

It is observed, that the labourer pays 100 per cent. tax on his beverage whilst the rich pays but 80 per cent., or one-fifth more; but, as the labourers require four times as much beer as the rich of wine, they are taxed five times as much as the rich; a half-penny per pot seems but a trifle, but *four half-pence per day* is one-eighth of their wages, *or income*; thus they are prohibited the use of beer in a great measure. If one half-penny per pot is no object, and does not reduce consumption, by a parity of reasoning, and another half-penny would be none, and as it would cost no more to collect, a double tax would be a clear revenue of five millions, by which the National Debt might be cancelled; and if the three millions left in the maltster's hands increase the price of barley, we may presume that six millions would increase the price still more; such was the inference to be drawn from the arguments used to mystify the question, and scare honoured members from their propriety; the ghost of the property tax alarmed them, but surely the landed interest need not fear a property tax? To have their rentals reduced by the blighting effects of the malt tax, is far more injurious to them; a property tax would reach the moneyed interest, whilst now the land has to bear all the burthen, but we doubt much whether it is necessary to impose a *permanent property tax*; we think an issue of Exchequer bills would suffice, and that the revenue would suffer but a temporary deficiency from the repeal of the malt tax; that there are no means of increasing the revenue but by giving prosperity to agriculture: and that the repeal of the malt tax

would assist. The price of produce must be increased by some means, and we know of no means but by increasing consumption: the consumption of food cannot be increased but by increasing the demand for labour; and the repeal of the malt tax would increase the demand for labour, or it would *prevent a decrease*, by enabling the farmers to keep their lands in cultivation; we are aware that the price of produce cannot be remunerative from the defective nature of the corn laws. It was ascertained by the best evidence, that wheat could not be grown to profit under 8s per bushel, yet the corn bill fixed this price as the maximum; we must have a higher price occurring as well as a lower, to obtain an average, but this we cannot have; the average is between the minimum and maximum, except that the mint price of gold gives a premium of 20 per cent. in favour of the importers, and thus give us but an average of 45s per qr. All attempts to bring the subjects at issue fairly before Parliament are in vain without union of purpose, and without being discussed by a competent committee. The most rational mode of proceeding is to petition for the establishment of a Board of Agriculture, and if this is not complied with, to establish an independent Board. There must surely be a sufficient number of affluent land owners friendly to such a measure to establish a Board, or Central Association. It is evident that prices must be raised to the legitimate standard, or the farmers must reduce their expenses to meet the emergency of the case. They must grow less breadth of corn; poor light lands must be laid for sheep walk, and poor heavy soils must be laid down with grass seeds for two or three years in each course; less plough cattle will be required, less drivers, and less wear and tear; and blacksmiths, wheelwrights, collar-makers, and other tradesmen's bills will be reduced, and the cost of raising the tithe will be reduced, and rest will renovate the soil, and less artificial manure will be required, and the demand, and, consequently, the price of town manure will be reduced. This system will throw more hands out of employment, and increase the poor-rate, and *reduce the revenue*; but self-preservation will drive farmers to resort to this as their only means to save themselves from ruin; *the system is begun, is progressing, and will increase*; it is the practice in all countries where arable produce is below a remunerating price, and has formerly been resorted to in England, and never laid aside in some districts; labour wages will be reduced, and there will be less demand for goods and wares, and general economy will lead to general ruin. Mr. Foaker's Prediction will *soon* be verified, and then Tallyrand's will soon follow.—  
Yours, &c., A FARMER.

**KILLING AND PRESERVING.**—The Vedahs (a savage tribe inhabiting part of the country between Trincomalee and Galle) have a manner of killing elephants peculiar to themselves. They go out against the animals in great numbers, and drive a herd up a hill, when a few marksmen, provided with bows and arrows, the latter notched in the centre, steal close to the heels of their destined prey, and as the animal lifts its leg they discharge their arrows, endeavouring to hit the centre of the foot: when the unfortunate animal suddenly stamps on the ground from the pain, the arrow breaks off at the notch, and the head is left sticking in the flesh. Perfectly disabled by this agony, the animal is compelled to lie down, when a shower of arrows and

other missiles speedily dispatch him. These people are careful to select the tuskers, if possible, as it is for the tusks chiefly that the Vedahs hunt; for although they eat the flesh of the elephant, they do not esteem it so highly as that of deer and hogs, which they have in abundance; and when they kill more animals than they require for immediate consumption, they preserve their store by cutting the flesh into slips; and after drying it in the sun, they place it in the hollow trunk of a tree, and cover it with honey, which is soon attacked by swarms of ants, in such multitudes as to form a crust, that in a short time grows dry and hard; this protects the meat from the external air, and preserves it most completely.—*Holman's Voyage Round the World.*

### OPERATION OF THE POOR-LAW AMENDMENT BILL IN THE PARISH OF IVER, IN BUCKS.

It is particularly satisfactory to notice the good effects of the Poor-Law Amendment Bill in that county, where the old system had been carried to such an extent that the land of entire parishes had been relinquished by the proprietors and given over to the paupers.

The Select Vestry of Iver have just published their report, dated March 24th 1835, and signed by the Vestry Clerk, containing the following satisfactory account:—On the 21st of June, 1834, the vestry were appointed; and immediately began to act upon the "Improved workhouse system," which had been so successfully adopted in Great Missenden. In the year ending March, 1834, the total expenditure of the parish of Iver was 1,982l, and in the year ending March, 1835, 1,687l, a net decrease of 295l; besides which they had paid off 180l of debt, and left an increased amount of available rates. There were twenty able-bodied labourers on the parish when this Vestry took charge of its affairs, and at the date of their report *not one*. The Select Vestry, moreover, most commendably state, "That whenever it appeared that the case of an applicant for relief was such as not to require a too strict adherence to the rules, they invariably consulted the feelings of the applicant; for it was their desire not to act 'harshly.'" This is administering the law in its true spirit; and we earnestly recommend the perusal of the detailed report of the parish of Iver to such vestries as may have hitherto been deterred from adopting the amended poor-law, by the diatribes of its opponents, or their own mistaken views of humanity. Let them observe that the Select Vestry of Iver, after such a reduction made in nine months, are able also to congratulate themselves at the conclusion of their labours, that they leave the labourers of their parish generally in a *greatly improved condition*, and to express a reasonable hope that the adoption of these improved measures has given an irrecoverable blow to pauperism in their parish. The Select Vestry conclude with an entreaty (in which we cordially join) to others, "to unite for the exercise of that power in every way calculated to promote among their poor neighbours habits of industry, sobriety, and economy; and thus further the operation of the Poor-law Amendment Bill, which appears eminently adapted to improve the condition of all classes."

Such Reports (and this is by no means a solitary one) are the best refutation of those virulent calumnies heaped upon this truly benevolent plan by its mistaken or malevolent opponents.

## DUTCH AGRICULTURE.

The Dutch papers of April 18 contain an account of the debate in the Second Chamber of the States-General on Mynheer Van Dam Van Yssel's motion relative to agricultural distress. The motion was for an address to the King, praying the appointment of a commission to inquire into the state of agriculture. It was opposed by several deputies on different grounds:—1st, that the manner in which the subject had been brought forward was unconstitutional; 2d, that the proposition was unnecessary, after the notice which had been taken of the state of agriculture by his Majesty, in the speech with which he opened the session, and in the address which replied to that speech; 3d, that instead of an inquiry a specific law should be proposed, by which means opportunity would be afforded for the full discussion of the question; 4th, that there was reason to fear that the measures which might be adopted for the relief of agriculture would operate injuriously on other interests of great national importance. The motion was, however, supported by a majority of members, who, with protests against the introduction of restrictive laws, declared their readiness to concur in any measure for the benefit of agriculture, provided it did not endanger other interests. They therefore voted for inquiry. One of the majority referred to the land-tax, the excise on different articles, the duties on distillation, and various other imposts, which, he observed, indirectly affect agriculture, and which, in conjunction with the other public burdens, formed, in his opinion, the real cause of the distress. Another member, who voted on the same side, blamed the government for not leaving agriculture more to itself, and insisted that the general welfare should not be sacrificed by imposing high duties on the importation of corn. To the weight of taxation, the financial measures of the government, the inundation of some districts, and to the unfortunate political relations in which the country had now for more than four years been placed, he ascribed the distress. Van Dam in his reply observed, that his only object was to promote an inquiry, not to injure commerce. In conclusion, he also declared that he was no friend to a prohibitive system. The motion for an address was then carried by 37 to 15, and communicated by a message to the First Chamber.

**SOURCE OF ANIMAL HEAT.**—From observations lately made by Mr. Hermann, it would appear that the modern doctrine of the formation of animal heat is founded upon just grounds. According to this theory, animal heat is nothing but a chemical product resulting from a process analogous to combustion, and which takes place during the respiration. In this theory, animals who do not form any water by their respiration, ought to produce as much caloric as the carbon which they transform into carbonic acid would emit by being consumed. This proposition has been confirmed on three chaffinches on which Mr. Hermann lately experimented. In the space of 48 hours these birds reduced to a liquid, in the calorimeter of Lavoisier, 16,960 grains of ice, and 165.2 grains of carbon were found in the nutriment the birds had taken during that time. These numbers accorded very closely with those resulting from theory; for if we admit that one part of the carbon, while being converted into carbonic acid, melts 104 parts of ice, the 10.2 grains of carbon should melt 17,180 grains of ice.—*Paris Advertiser.*

## RELIEF UNDER THE POOR LAWS.

The following is the relief to the indigent ordered by the Poor Law Commissioners to be given in some of the newly constituted unions of parishes. It is understood that these orders are preparatory to the discontinuance of the allowance system, by which independent labourers have been pauperized:—

“Firstly. No relief shall be given in money (except in cases of sickness or accident) to any able-bodied male pauper who is in employment (the same not being parish work), and in the receipt of earnings; nor to any part of his family who shall be dependent on him, or for whose relief and maintenance he shall be liable.

“Secondly. If any able-bodied male pauper shall apply to be set to work by the parish, one-half at least of the relief which may be afforded to him or to his family shall be in kind.

“Thirdly. One half at least of the relief which may be afforded to widows or single women, not being aged or infirm, shall be in kind.

“Fourthly. No relief shall be given to any able-bodied male pauper by payment or payments, of, for, or on account of the rent for his house or lodging, or for the house or lodging of any part of his family who shall be dependent upon him, and for whose relief and maintenance he shall be liable, or by allowance towards such rent.

“Fifthly. Except in case of accident, sickness, or other urgent necessity, no relief shall be afforded from the poor-rates of any parish or place comprised in the said union to any pauper between the ages of sixteen and sixty, belonging to any such parish or place comprised in the said union, who shall not be resident therein: Provided always that this regulation shall not extend to any person not being an able-bodied male pauper between the ages of sixteen and sixty, who shall, on the day herein appointed for the first meeting of the guardians, be in the receipt of relief from any parish or place comprised in the said union, although not resident in such parish or place, and although such person shall continue a non-resident: but in every such case due inquiry shall be made as to the propriety of such relief being continued.”

**TRADING STOCK OF FORMER TIMES.**—In 1296 and 1301, a carpenter's stock was valued at a shilling, and consisted of five tools. Other tradesmen were almost as poor. A tanner's stock was worth 9l 17s 10d.—more than ten times any other. Tanners were principally tradesmen of the first description, the chief part of the dress at that time being made of leather. A very few silver cups and spoons were the only articles of plate in use, and those were confined to the higher classes, the mechanics and tradespeople using wood and horn.

The human brain generally weighs, according to Soemmerring, from 2lb 5½oz to 3lb 3¼oz. Professor Dewhurst has weighed several at 4lb. The brain of the late Lord Byron, without its membranes, weighed 6lb, and contained more medullary substance than ordinary, as also did that of Oliver Cromwell. That of Dr. Gall weighed only 2lb 10oz 7½drs. Baron Cuvier's brain weighed, according to M. Berard, 3lb 13½oz, and, according to M. Rousseau, 3lb 14oz 4drs. A horse's brain weighs only 1lb 4oz, and that of an ox one-fourth the weight of the human brain.

## AGRICULTURAL DISTRESS.

TO THE EDITOR OF THE "YORK HERALD."

Sir,—In addressing a few observations to the many readers of your useful Journal, on the subject of the present agricultural distress, which so glaringly prevails, and apparently increases daily (I think I may conscientiously with truth say) throughout England, I hope no well disposed person will deem me impertinent or obtrusive. I am, myself, in a great measure a disinterested person in the matter, except inasmuch that an innate feeling of regret for the suffering condition of the agricultural portion of humanity prompts me to advocate its cause, and to pen these observations that I might add my mite of support, and to draw the attention of our legislators and others who are in power to use their endeavours to alleviate, as much as possible, the distresses not only of those who are the most strenuous and laborious in their exertions to gain an honest livelihood and withstand the general shock and ruin which stares them in the face—but also of those who, combined with such exertions, have the additional and strong support of comparative wealth, which they find is fast disappearing away in supporting their farms in the present state of things. Even those farmers who are blessed with comparative wealth, the produce of many years of toil, hard working and care, find it impossible, in many instances, to retain their farms and withstand the ruin which the present agricultural distress threatens them with, or, if they do endeavour to keep their situations, in the ephemeral, but delusive, hope, *that times may soon mend*, it is by the sacrifice of their former and hard-earned savings. How many farmers are there who had saved a little money, and retained their farms in the expectation *that times would soon mend*, but have waited until all their former savings have disappeared in supporting their farms, and then they have been left in penury and debt?

It is a melancholy consideration for the elderly farmer to entertain, who, after a long series of years of laborious exertion, care, and parsimonious saving, has probably laid by a few hundreds of pounds to support and comfort him in his declining years, to find himself gradually becoming worse and worse in his pecuniary affairs, in endeavouring to meet the depressed times, and support himself and his family in his situation; and he finds he is, in his old age, again compelled to renew the toils and cares of his youthful days, in order to gain a precarious, but honest, living—at the same time, the "*little all*" he had saved dwindling fast away in supporting himself and family. And if those few hundreds which he had so saved could still keep his life and soul together for the few short years he may have to remain in this trying world, he is still assailed by one of the bitterest thoughts with which it is the lot of the honest, upright, and worthy farmer to bear, namely, that his wife, his children, the dearest objects of his life, may after, nay even before, his death, be compelled to embrace, through necessity, the offer of an asylum in the parish workhouse! the idea of which, at one time, he would have scorned, and he recoils from the unavoidable act with the deepest and most heart-breaking sensations of sorrow. The imaginary disgrace appals him; he despairs of gaining a livelihood in his native country, and either expatriates himself, or, what is more distressing to his family, he is hurried to a premature grave. Some may think I have drawn my picture too extravagantly, but many, many know it to be too true. Daily observation will serve to prove that a

considerable number of farmers and others, farmers particularly, are obliged to banish themselves, *even at a great age*, from their native country, to America and other foreign parts, to gain that subsistence there, which they are unable to obtain here. Besides, many of our wealthy farmers are constantly emigrating abroad, and of course impoverishing, by taking from this country a capital which, if they remained here, they are in the constant fear of losing; the loss or withdrawing of which capital, the amount of which I believe is immense, if not now, eventually must, be felt to be a matter of serious importance to the welfare of this country. Therefore I do think our legislators should not delay instituting the requisite inquiries, in order to discover the evil of, and the remedy for, the present deplorable condition of the agricultural interest. It is indispensably necessary, and behoves them, as a duty, to bring forward such measures as will be most likely to alleviate the distress, and support the tottering circumstances of that most useful and highly respectable portion of humanity—the Agriculturists of Great Britain.

The farmers themselves say they have done all they could, and are still endeavouring to do all they can, to stem the course of ruin which is daily spreading widely amongst both rich and poor of them, in the hope (which hope I trust will speedily be fulfilled) that the Legislators will do something material for their benefit, and stay the future progress of their distress. If these lines should meet the eye of any honourable member of our legislature, I earnestly entreat him to give the subject a serious consideration, for it certainly requires it as the whole body of agriculturists can testify. It appears to me that the distress of the farmers is much less noticed by our legislators than is that of the manufacturers. In fact, the agricultural distress is treated almost with apathy. But when distress assails the manufacturing interest, those employed in it immediately testify their unfortunate condition by large assemblies and meetings, which admit of nothing less than an actual remedy to keep them quiet. Now, the farmers cannot so easily adopt such measures, even if they were inclined to do so; because the agriculturists being so widely spread and so far distant from each other, if a meeting were called amongst them, a circuit of twenty miles at least would have to be taken to collect a numerous body like that of the manufacturers, who can always raise an immense multitude on the spot, and at a moment's warning. Besides, (and without meaning disparagement to any one,) the character of our farmers is of a different nature to that of our manufacturers—it is a quiet and peaceable disposition. Yet, if something be not done for them, and that speedily, I am afraid their peaceable and quiet disposition will no longer sustain them under their accumulating troubles; their patience will be exhausted, and no longer can or will the English lion tamely submit to be trampled upon and neglected, without making one single effort to extricate themselves from their difficulties and distress. What many of them suffer, both in mind and body, to those by whom it may not be understood, it is almost past description to conjecture, and such are their feelings that it is beyond human nature long to endure them. It is a pity that the pride of our ancestors—our strong help in times of trouble and danger—some of his Majesty's most loyal and peaceful subjects—I mean our peasantry, our yeomen, our farmers, should be so neglected and driven to want and expatriation as I believe too many of them are. And in writing these observations, my sole intention and hope is, that it may be the means of drawing the at-

tention of those in power to guard the interests and relieve the distressed condition of the Agriculturists. If they are eventually and shortly relieved, and their happiness and prosperity be restored, all that I am aiming at will be accomplished, and I shall look back with unmingled pleasure and delight on my humble and feeble efforts on their behalf. In regard to landlords, my opinion is, they are often blamed when there is no reasonable cause; for, in general, I do not believe the evil of the agricultural distress rests with, or can be attributed to them. A great tumult is often raised by many inconsiderate persons respecting the "too high" rents. They say "why do not the landlords settle their rents and make them more agreeable and less oppressing to the farmers?" This consideration, if so they may call it, but I regard it merely as an unthinking observation, although it may, perhaps, in some instances, have a good deal of reason in it. But to the practical agriculturist, to the thinking and duly considerate, and disinterested farmer, I will venture to put this question, namely—could he at the present time, according to the market prices of grain and other produce, make a livelihood on that farm, for which, a few years ago, when times were good, he was very likely paying as much as from 30s to 40s per acre, supposing he were now to have it at a reduced rent of from 1l to 30s per acre? Again; we will suppose a farmer occupied a farm prior to the commencement of this agricultural distress (we will say for argument's sake about the year 1825,) at the rate of 13s or 16s to 1l per acre, by which at that time he was enabled to make a fair and decent livelihood, pay his rent, tithes, taxes, and rates, and support his family respectably; here, I would ask, could a farmer now, as the times are, make a livelihood at all, on that farm for which he previously paid from 13s to 1l per acre, *even were he to have it rent free*? I have asked the opinion of many practical farmers on the subject, and am informed in many instances he could not. If this is credited, and I do not discover any reason why it should not be, then the landlord is not so much to blame, as it is often said he is. And what is to become of the landlord who, probably, has no other kind of land than that, which even in good times, could not be let for more than from 13s to 1l per acre? *Such farms will have to go out of cultivation*, as nothing can be made of them; and the landlord be placed in a worse situation than the farmers. I think such landlords will, at any rate, be placed in a very critical situation. Their dilemma will be serious; perhaps having a large establishment to keep up—many poor persons existing solely through their beneficence—and, yet the landlords themselves having nothing to depend on for their own subsistence, except the rents of their lands, which at this time cannot very likely be let at any price—especially if their estates consist of *bad land-farms*. For, if a bad land-farm were offered to many farmers, on condition that it were tilled, kept in good order, and all assessments, rates, and tithes to be paid by the occupier or tenant, I believe few would be found willing to undertake it, even on the tempting condition of *having it rent-free*. Then what are the owners of bad-land-farms to do? How are they to live? They must fly to such resources as the fertility of their minds may be able to invent. Therefore, I cannot think the present agricultural distress is to be attributed to the landlords. The fact is, bad-land-farms are worth nothing now. Rates, assessments, and tithes are high—labourers receive the same wages as in flourishing times—servants are not satisfied with the same kind of food as

they formerly were—(and I have heard of some instances where they were not satisfied with the same food as their master's, but have actually summoned such master before a magistrate, in order to compel him to find them better.) Besides tillage is as expensive as formerly, if not more so; the price of corn is at the lowest ebb, and money is more scarce, or it rests in fewer hands.

In regard to the *corn laws*—I once had a long conversation on this subject with a very intelligent North-Riding farmer, who was of opinion, "*that there must be a regular and fixed duty upon all corn imported, and that that duty should be paid immediately on being landed*, in order to benefit the English farmers; and that such corn should not be kept in bond, as it now is, the duty to be paid when the importers think fit, for that in a great measure was ruinous to the interests of the farmers. And that it was the candid opinion of all the farmers in his neighbourhood, (the North Riding,) as well as of himself, that the duty should be a *fixed duty* of not less than *twenty shillings per quarter*. And that the farmers must have a duty *large enough* to enable them to cope with foreigners; for were corn to come in *duty free*, he found from good authority, it could be delivered here at 24s or 26s per quarter; which naturally prompts the question, what would be the consequence? The result would be the whole of the *bad-land-farms* must instantly go out of cultivation, and then they would not be worth one shilling per acre; for as it is, they are really worth very little with corn at its present low price. And if these bad-land-farms were laid down to grass they would carry no stock whatever; therefore, the landlords for a certainty would have to take all such farms into their own hands." This farmer also made an ingenious remark, namely:—"That if the farmers could keep wheat at 8s per bushel, they then could and would make all the trades-people live—they could then purchase two or three coats for themselves and suitable clothing and other necessities for their wives and children, and also could afford such wages to their labourers as would enable them to do the same. But if times do not mend, they, the farmers, must wear out what coats they had, and afterwards do with one in a year, and be glad to get it."

After craving your indulgence, Mr. Editor, and apologizing for the length of my letter, I have further to beg for the welfare of the agricultural interest, that you will be kind enough to insert this letter in your next *HERALD*.

I am, Sir, your obedient servant,

A FRIEND TO THE FARMERS.

Wetherby, 27th April, 1835.

SALE OF BEER LICENCES. — An account of the number of licenses granted under the Sale of Beer Act during the years 1833 and 1834:—

|                                                                              |        |        |
|------------------------------------------------------------------------------|--------|--------|
| Licences granted to retailers of beer,                                       | 1833.  | 1834.  |
| cider, and perry . . . . .                                                   | 34,976 | 21,975 |
| Retailers of cider and perry only . . . . .                                  | 653    | 1,054  |

## TO THE EDITOR OF THE SUFFOLK CHRONICLE.

SIR,—I am desirous, through the medium of your paper, to draw the attention of the Flock Masters and the Wool Growers, of the Eastern Division of this county, to the necessity of their attending to the condition of their fleeces at the approaching *Washing and Shearing*; and if you deem the few remarks I have offered on the subject deserving a place in your columns, I shall feel myself obliged by your inserting them.

It is generally urged against the Suffolk Wools, by the manufacturers, that the Hogget Fleeces, both Down and half-bred, are injured by *too early clipping*, and the colour and condition of the fleece is said to be less attended to in this than in other counties.

By early clipping, the length of the staple is injured and rendered of less value to the spinners, and the grower is a loser both in the weight of the fleece and its value in the market.

The colour and clean condition of the Wool is likewise a very necessary point to be attended to, as many flocks are left on hand, although of good quality, solely from want of attention to the condition; this probably arises from the washing of the Sheep being left to the men employed for that purpose, without their being sufficiently impressed with the necessity of its being carefully done; and sometimes, probably, from the Sheep being driven on improper ground after washing. I am induced to offer these hints for the consideration of the Wool Growers, from a wish to redeem the credit of the Suffolk Wools; and feeling convinced, that with the very abundant supply of Wools which are now sent to this country from almost every quarter of the globe, that it is desirable to give the growth of our own country every advantage that it can derive from attention and good management.—Your, &c.,

Yoxford, April                      EDWARD REVANS.  
28, 1835.

CURIOUS POST OFFICE.—It is well known that they have not, in those countries where the mail is carried along by swimmers, franked bushels of pamphlets and papers to send, as we have here. There are curious post establishments in this world! I knew an old woman who spent her life in walking from Berlin to Posen, and from Posen to Berlin, about a hundred and forty miles. She was called the Living Gazette. Have you ever heard of the celebrated post office of the whalers at Essex Bay, on one of the Gallapagos Islands in the Pacific? There is a cave, well secured against the weather, in which whalers deposit letters sometimes for the information of other whalers, sometimes to be taken home when a returning fellow-hunter on the deep passes by. I had heard of it by whaling Captains, and found it, afterwards, mentioned in Lieutenant Paulding's Journal of a Cruise in the United States schooner Dolphin, among the Islands of the Pacific (New York, 1831),—a little unassuming book, full of interesting items. Lieutenant Paulding found a letter there safely deposited. This insulated fact shows strikingly the existence of a common bond and trust among civilized nations; so does a letter deposited in a post office of the farthest west of Missouri, which safely arrives in a village in the most eastern part of Germany, if it only has the words "Via New York and Havre" on its direction. In the middle ages, there was a man who carried letters from Pomerania to the students of that country in the University of Paris, and when I lived at

Rome the "courier" was yet existing, who regularly carried letters from Rome to Spain. And yet we are told that the world goes back; or is it maintained that improvements of this kind belong to the industry of nations only, which is allowed on all hands to improve rapidly, while, morally, we degenerate? I would deny this; there is morality in an intercourse of this kind between nations; it requires a universal acknowledgement of certain broad principles of honour and morality. It will yet happen, within the next hundred years, that letters are directed from London to Canton (perhaps to Peking), via New York and the city which will rise at the mouth of the Columbia River.—*Stranger in America.*

## INCLOSURE OF WASTE LANDS.

TO THE EDITOR OF THE LIVERPOOL MERCURY.

SIR,—Your correspondent, 'James Brown,' seems to think that the peasantry and small farmers have sustained great injury, and in fact, have been driven to poverty and the parish by the enclosure of waste lands and the system of converting small farms into large ones of from 500 to 2000 acres. Having resided the greater part of my life in the centre of a great agricultural community, I feel called upon to disabuse the minds of your readers from any impression which may have been made by the insinuations of Mr. Brown. It is well known, and hardly requires confirmation from me, that there is no system more just or free from the charges of corruption made by your correspondent than the system of inclosing waste lands. Your correspondent ought to know that every landowner on the verge of the common intended to be inclosed, or within the different townships, joins in an application to Parliament for leave to inclose those lands and commissioners are most impartially chosen to see that every person's interest is protected, and wherever the poor cottager has obtained a location his right is invariably respected, and generally those very cottagers have small allotments made them, and I believe I can say without fear of contradiction that they are benefited rather than injured by the inclosures. Such, Sir, has been the case on the extensive forest of Needwood, in Staffordshire, which, before it was inclosed, was a harbour for the most desperate characters, and the cottagers were far from being that honest and respectable race they are now. To reply in detail to your correspondent's queries would take up too much of your valuable space, and I shall, therefore, content myself with stating that there are put very few farms of 500 acres, much less of 2000. I deny that the landlords generally are desirous to convert the small farms into large ones. Since the Reform Bill has passed the matter is reversed, and I am sure those stewards who have fallen under my notice are men who would not be influenced by any such motives as your correspondent suggests. Some years ago a charge was made against the agent of the late Duke of Sutherland, to the effect that he was desirous to have no farms less than 500 acres, and to see the occupier living in a fine house above his means, but I am unable to say how far the writer in question was justified in these assertions. I can, however, confidently say that no man in the counties of Cheshire and Staffordshire has a right to say there is a difficulty in taking a small farm even from ten to one hundred acres, and the generality of farms in the former county are from eighty to one hundred acres. I deny that where spade cultivation exists it is adopted mainly to profit the owner. The views I am sure of those gentlemen that

I know are dictated by a pure philanthropy, and a desire to better the condition of their poor neighbours. The instances are happily few where the small industrious farmer has been driven to the parish or labouring work by the grinding disposition of his landlord, or the loss of common rights. No, Sir, I am glad to say there is a different feeling abroad amongst the landed gentry, who, from my own personal knowledge, are bettering the condition of the industrious farmer by lowering rents and enabling him to manure and till the land in a way profitable to both. I admit there is much distress, but this is owing to extreme low prices, and even this is compensated to a certain extent by the very superior and abundant crops with which Providence has lately blessed us. Taking matters, however, on the whole, there is less cause of complaint than your correspondent would fain suggest.—I am, Sir, Yours, &c.

THOMAS BAKEWELL.

Manchester, March 3rd, 1835.

### IMPORTANCE OF AGRICULTURE.

From "*The Emigrant's Tale*," a Poem, by JAMES BIRD.

Britain! thy children are the free and strong  
In soul and form; to thy bright name belong  
Undying glories! In thy people dwell  
The might of mind, the virtues that excel.  
Thy arts, thy commerce, flourish and extend,  
They know no limit, may they know no end!  
Yet other springs of boundless good are thine—  
Let but thy sons in wisdom work the mine:  
Whence drew our fathers wealth? Whence did their  
toil  
Diffuse the gems of plenty?—From the Soil!  
On what firm basis can thy credit stand  
Amid the shock of nations?—On the Land!  
What spreads in peace unnumbered blessings round,  
Supporting life to all that breathe?—The Ground!  
What gives in war thy greatness, glory, birth;  
Sustains thy brave and countless hosts?—The Earth!  
Yes, my lov'd country! may thy peasants still  
Toil with delight in valley and on hill;  
May yet the tillers of thy land be blest  
With wealth for labour, with content in rest;  
May those who govern, and the govern'd, learn  
That Nature's laws are ever kind, not stern;  
That, from the Earth, our common mother, springs  
The life-blood of thy people, and thy Kings!  
That all which food, and health, and raiment yields,  
Flows from the riches of the garnished fields;  
And, as the dews of heaven impartial fall,  
They smile, and bloom, and bear their fruits for all!

### TO THE FARMERS OF DEVON.

TO THE EDITOR OF THE "EXETER AND PLYMOUTH GAZETTE."

Sir,—The burden borne by the Agriculturists for the support of the poor has become so great, that the subject has awakened the attention of most of those who know or feel the pressure. The Legislature, also, urged by the magnitude of the evil, has attempted to remedy the same. Many writers on political economy have also thought it of the highest importance to investigate the causes which have operated to produce a state of society so different from that which was contemplated by the benevolent framers of our original Poor Laws. But the mass of evidence on this subject, the conclu-

sions come to by political writers, and the opinions of all political men agree in this—*That while there was something wrong in the Poor Laws themselves, there was, and is still, something worse in their application.* And no inconsiderable number are of opinion, that if the laws, before the late Poor Law Bill, had been rightly acted on, they would have been found sufficient for nearly all the purposes for which they were originally intended. Society, most certainly, is different from what it was nearly three hundred years since; and yet it is astonishing how well the spirit of the laws then framed, would, if carried into effect, answer our present wants. As to the new Poor Law Bill, no person seems to understand it. Other Acts of Parliament take effect immediately on their being passed, but this seems a law which may, or may not, be put in force. Lawyers may understand all this: I, as a farmer, cannot. But I will say nothing now as to the new Poor Law Bill; for, however it may operate, much will depend on the ability of those who have to carry its provisions into effect.

That there are evils, every payer of rates knows: for, while farming capital has been reduced one-third, and in some cases one-half—while the percentage profits on the reduced capital is incalculably less than it was twenty years since—yet the expenditure for the poor is as high, in many places, as it was then, and in some places higher. Then wheat was from 100 to 110 shillings a quarter, now it is less than half that sum. It is not, therefore, to be wondered at, that those who support the poor, feel the expense a burden.

The next questions are—how did those evils originate? and by what means might they have been partly avoided? and what measures should be pursued to avoid the increase of those evils in future? The returns from the different parts of England show a great difference of expenditure: in some places as high as twenty shillings a-head, according to the population, in other places not more than four shillings—and the difference is mainly to be attributed to the good or bad administration of the Poor Laws. I here quote the words of a widely circulated publication:—"That the difference in the amount of rates arises chiefly from the difference of management, we have the testimony of numerous able writers, and of several reports of Parliamentary Committees resting on evidence. Abuses of various kinds have been introduced, in many of the Southern counties especially, productive of serious injury to the landowners and the peasantry." After going on to state the manner in which the overseers of the poor of most parishes are generally appointed,—it says, "If a parish be sincerely desirous to lessen their expenses, and duly administer the law, their first step should be to appoint a permanent overseer, paid by the parish, answerable to the vestry, and removable for misconduct. It will be the business of this person to acquaint himself with the law, and his duty to execute it: he must devote himself to this object, and he will soon become acquainted with the characters of applicants, and the best mode of dealing with them." There is no difficulty whatever in appointing such an officer. It may be done by the parish in vestry, and the magistrates will confirm the appointment, as provided by the 59 Geo. III. cap. 12. "In above two thousand parishes, such permanent overseers are now employed; and are, almost without exception, found highly useful. The amount of their remuneration is generally saved over and over to the parish, by the diminution of other expenses." There-

fore it is shown that the present heavy expenditure has been partly occasioned by the manner in which overseers have been appointed, and the consequent mismanagement attending such appointment; that it would have been avoided, in part, by a different appointment, and a stricter attention to the provisions of the laws; and that the only way to lessen the expense in future—or, perhaps, to keep it from still increasing—would be to adopt the measures recommended by those who have tried and found them successful.

I know that many persons who have not thought seriously about this question will not believe that any benefit can be obtained by the appointment of assistant-overseers. But every thinking and intelligent person knows, that the present manner of appointment is liable to many objections: the bad management of parish officers, under such a system, is proverbial. A man who has to remain in office one year only, generally takes up the affairs of a parish as he finds them, gets through the business in the easiest manner he can, and transfers the future management to another, who goes on in the same wrong way. Under such a regulation all sorts of evils creep in and accumulate; and it is too much to expect that any individual so appointed should undertake to reform abuses, even if he should have the knowledge or ability to do so. Some will think of the expense of a paid overseer; but they should reflect, that the present expense is far from being inconsiderable, though little thought of. In some parishes that I know, the plan here recommended has been tried with all the success that could be desired; in one, with a population of about 2,000 persons, there was an appointment of this kind for many years. It answered well, and was discontinued because the person who had done the office for a series of years would do it no longer, on account of the improper interference of others: the consequence has been, a great increase of expenditure, and even of discontent among the poor. Many like instances might be produced, but not one to the contrary—except where the parish had made choice of an improper person, or had not taken the necessary precautions and securities.

The object of those who have the management of the parish funds should be—the *keeping down or lessening the Poor Rate, without lessening the comforts of the poor*; and no inconsiderable share of tact, firmness, and ability, is required to do this; and in large parishes, nothing but a permanent and respectable overseer will do this successfully.

The periodical publication of *all* parish accounts is a matter of great moment, and would be of essential service: it would prevent fraud, by giving all the parishioners an opportunity of detecting it. It is well known, that many an expense and imbursement have been brought on parishes by the ignorance of overseers, and to the want of caution in giving relief. A permanent overseer would be likely to avoid those evils. Such an overseer would become acquainted with the wants and peculiar circumstances of every individual applying for relief, and the very knowledge of this would prevent the attempt at imposition.

It is the duty (as I have said before) of the overseer to keep the expenses as low as possible; but it is no less his duty to see that the really necessitous poor—the persons intended by the legislature to be relieved—should be properly taken care of. And here I cannot but observe that, independent of mismanagement, bad policy has reduced many a poor man to be a pauper against his will. It

would be a good plan to encourage *Benefit Societies*, and to see that they are properly managed. Encouragement should always be given, and rewards distributed to the deserving. Foster in the honest and industrious man an independent spirit; let him know and feel that it is worth while for him to exert himself; let him have something to look forward to; and by such excitement he will be stimulated to keep himself from the degradation of applying for parochial relief. The thing will be good in itself, and will operate powerfully as an example. Though it is the duty of every man, however poor he may be, to take care of himself; yet it is the policy of others to assist, encourage, and enable him to do so.

The force of all I have said tends to shew that the present system, as regards the management of the poor, is bad; and that unless some other plan be adopted, the evils will increase, even in defiance of the new Poor Law Bill. I have also shewn, from the example of those who have tried, from the recommendations of Parliamentary reports, and of other writers on this subject, that the first step towards a remedy is the appointment of permanent assistant-overseers. We trouble ourselves greatly about Parliamentary affairs—talk much of the waste of the public money—of the mismanagement of this, that, and the other—busy ourselves about reform, &c.—but if we were to look to ourselves, if we would but reflect that the business of a parish and the appropriation of its funds are much of the same kind, and require the same diligence, talents, and integrity, as the business and management of the funds of the State, we might find much amongst ourselves to watch over, revise and reform.

The time is near at hand when the parishioners in every parish must appoint their overseers of the poor for the year ensuing. Let them also think it worth while to have the now complicated and onerous business of their respective parishes well done. A reform of this kind would be worth their attention, and would do something towards the relief of agricultural distress; aye, and independent of its immense moral good, afford more relief than the remission of all the direct taxes on agriculture.

A DEVONIAN.

## TO THE EDITOR OF THE NORTHAMPTON MERCURY.

SIR,—As several very intelligent correspondents have stated their sentiments, through the medium of your useful paper, on the subject of Agricultural Distress, and on the best means of arresting its progress, I take the liberty of making a few observations on those communications.

In former letters I stated that agriculture might be relieved, if government would take the management of the poor into their own hands. This appears to be the opinion of Mr. Skene, and also of Mr. Green, whose letters recently appeared in the Mercury. Your correspondent on "Agricultural Distress," whose able remarks appeared in the Mercury for Feb. 21st, is of a different opinion. He thinks "the idea ought to be abandoned." With deference to one of whose remarks I in general approve, I must in this particular be allowed to express my dissent from his conclusions. I admit, that, if tenants are for ever doomed to bear the burdens of supporting the poor, &c. then, by committing the management into other hands, evils might creep in that would increase those burdens. Your correspondent must be aware that, by the enactment of the New Poor Laws, government have to

a certain extent taken the management of the poor into their own hands, as in the appointment of superintending commissioners. If they would abolish the laws of settlement, divide counties into districts (each district containing eight or ten parishes,) establish a poor-house in each district for the support of the poor (as stated 43 Eliz. c. 2, s. 1,) appoint guardians to act under the direction of the commissioners, &c. &c. and assess all property for the support of the poor and defray the county expenses, important benefit would be conferred on the agricultural interest.

Mr. Skene objects to a property tax, lest it should drive property out of the country. This I apprehend is not likely to be the case to any great extent. The property of this country is immense, and if fairly rated the tax would be easily borne. By the present plan of levying rates upon tenants, the burdens become insupportable, and great inequality and injustice prevail—a very painful feeling is excited in the minds both of those who give and of those who receive relief—until, in many instances, the security of persons and of property has been in danger. If the management of the poor were committed into other hands, and their necessities provided for by other means, these evils to a very great extent would cease to exist.

Your correspondent on "Agricultural Distress" is favourable to a property tax, as an equivalent for the malt and other assessed taxes, which he thinks ought to be taken off. My opinion is, that a tax on property should be levied exclusively for the support of the poor, and to defray county expenses. If once a property tax gets into the national revenue, it may be applied to pensions, sinecures, and other purposes. Your correspondent states that, "poor-rates are always considered in the rents." Again I must beg leave to differ from him. I know many cases in which they are not sufficiently considered; and it would be impossible for adequate allowance to be made unless the rents were abandoned; and would it not be an act of great injustice to compel landed proprietors, whose property lies in populous parishes, to sacrifice it for the support of the poor, &c. whilst other property is exempt?

Your correspondent further states, that "in populous parishes, where rates are high, great savings might be made if the occupiers of land were always unanimous as to the employment and good management of the poor." This may be true; but how few parishes which are heavily burdened are unanimous! One person thinks he is burdened more than others,—and this feeling will continue as distress increases. Thus by one individual the best-concerted plans may be frustrated. Although I advocate a property tax for the support of the poor, &c. I think it would be impolitic to confine taxes too much to property, for vast numbers of operatives and others who have large incomes, can afford to indulge in luxuries to as great an extent as many who possess property.—While therefore property should support the poor, &c. luxuries should be taxed for government purposes, and thus the burdens as much as possible removed from industry and the necessities of life.

With reference to the malt tax, I think it ought to be reduced one-half. It appears to me that government can do this without an equivalent. Would not such a reduction be followed by a very greatly increased consumption? Forty years ago the consumption of beer was as great as at the present time, although the population was then nothing like its present extent. Every additional duty upon malt has produced a decrease of consumption. From 1784 to

1801, in consequence of duties, the decrease of consumption in malt was 12,000,000 bushels, as compared with four years last century. In Scotland and Ireland the decrease was still greater. By reducing the duties on malt one-half, is it unreasonable to suppose that the increase of consumption would give an additional million of revenue, making the total revenue, after the reduction, three millions; especially presuming a sufficient check to be put upon the sale of spirits. The flourishing state of the revenue, as admitted by Sir R. Peel—the pressure on agriculture—and the claims of justice, imperiously call for a reduction of half the malt tax. In a communication I have lately received from a skilful arithmetician, he calculates that, by relieving the land from parochial charges, and the farmers from the employment of the surplus labourers, would relieve the farmer upwards of 30/100 per cent. upon his rent; and by taking off the malt tax he would be relieved 5/100 per cent. It is just to state that this gentleman pleads for the removal of the former only.

A question may perhaps be asked—if provision is to be made only for the necessitous poor, what is to be done with able-bodied labourers? Should the burdens of supporting the poor be laid upon property, and the laws of settlement be abolished, farmers would possess the means of employing a greater number upon the land, and labourers would reside where they could obtain the best employment. I would further suggest, whether it would not be to the interest of government and the country in general, to rate and let the crown lands to the most deserving labourers, at a moderate rent? Colonies might be formed at home as well as abroad, instead of advancing money for emigration. Land proprietors might with advantage let inferior land, with cottages, to industrious labourers for the employment of themselves and families. In the parish where I reside, half a dozen able-bodied men, with large families, have offered to support them without assistance from the parish, if they could obtain at a fair rent, about six acres of land for each family. Two of them occupy about two acres each, but this will not furnish employment for the whole year. If government should see fit to take the management of the poor and provide for their support by taxing property, philanthropic individuals have in contemplation to purchase inferior land, to let out in small lots to honest and industrious labourers. If such a plan were adopted there would be no necessity for applying to foreign nations for provisions, as a sufficient quantity would be produced at home. By this stimulus to industry the morals of the lower orders would be improved.

Before I conclude, I beg to suggest to certain gentlemen whom I wish by no means to offend, the impropriety of uniting small farms to make large ones. Those gentlemen perhaps consider it necessary. But would it not be much better in the first place to remove the causes of this necessity? That such a plan may for a short time be to the interest of a few individuals, I will not deny. But will it be conducive to the general good? Is it not probable that those who occupy large farms will in the course of time wish to divide them, in order to place their sons in business? Then the expense incurred by making large farms convenient will be lost. By enforcing this plan a most honest and respectable class of the community who have brought up families to habits of morality and industry, from not possessing sufficient capital to stock large farms, are deprived of the means of support, and numbers are driven to take their place amidst

the crowded ranks of paupers. I feel confident that the prosperity of agriculture in particular, and the country in general, will not be increased by making paupers, but by raising honest and industrious labourers to a state of independence.

Your's, &c.

C.

## RECORDS OF GENERAL SCIENCE.

By ROBERT D. THOMSON M. D., Lecturer on Chemistry in the Blenheim Street Medical School. With the assistance of THOMAS THOMSON, M. D. F.R.S. L. and F. F. L. S. F. G. S. &c. Regius professor of Chemistry in the University of Glasgow. Number IV. April 1835. London:—John Taylor.

The contents of this number are varied and interesting. The following is an extract.

### I EMPLOYMENT OF GYPSUM IN AGRICULTURE.

"Gypsum has been employed in Switzerland, Germany, England and North America for many years as a manure, but it was only brought into France about forty years ago. At present it is very generally used in that country, with the exception of the departments of Gard and Hérault (*Ann des Mines* vi, 193.)

For the purposes of Agriculture, it is sometimes calcined, which deprives it of its water of crystallization, which in the hydrous Gypsum amounts to 2 atoms. This preparation is attended to in France, where the expense of the process is less than in other countries. In England, Germany, &c. it is generally employed in the crude state. The effect which calcination produces, is to render the Gypsum more rapid in its operation, though the beneficial effects are less durable. In France it is formed in a kind of lime kiln by means of coal, after being reduced to powder.

In can be obtained in this state in Gard, for one shilling the 110lbs. averdu., and it costs double the expense in Alais. Extensive natural deposits occur in England, in the neighbourhood of the Humber, from whence it is brought to Glasgow and Manchester, for the use of the bleachers, who now employ it in considerable quantities. Its purity may be negatively tested by vinegar, which if it causes no effervescence, shows that there is no carbonate of lime present. If it swells up when water is thrown on it, and then assumes consistence, it is a sign that it has been properly calcined. The best plaster will absorb the greatest quantity of water. It is chiefly on artificial meadows that we observe the best effects from its application, more especially on Clover, Lucern, Sainfoin, and in general on the luginous tribe of plants possessing large and thick leaves. It has a powerful effect also upon natural meadows which contain much clover, vetches, and other analogous plants; but upon the grasses the effect of Gypsum is trifling. It acts according to *M. Thibault*, by extracting the moisture from the air, and stimulating the vital action of plants.

It sometimes doubles the product of Clover, Lucern and Sainfoin. In France it is "sowed" like Corn with the hand, about March, or April, when the plants are a few inches above the soil, so as to allow the Gypsum to fall on the leaves. It should be done previous to rain, but not during the fall of rain, or the existence of wind, or during frost.

The quantity of Gypsum applied to the land must

vary of course with the nature of the soil. In the course of fifteen or twenty days the good effects resulting from its use are visible, if circumstances have been favourable. The benefits of one application last for two or three years so that it is unnecessary to spread every year. In Gard and Hérault sainfoin is principally cultivated for pasture, and seems to thrive well in dry soils, especially in strong calcareous situations. About Alais, for the cultivation of this plant in artificial meadows, the ground is first "plowed" in November, then again in December, and the seed is sown in the beginning of April.

In Provence, and in the southern parts of Languedoc, when the effects of frost are less dreaded, it is sown in autumn. The sainfoin thus cultivated in inferior soil affords one or two crops in the year, and lasts for four or six years; then it is "plowed" up, and corn is substituted for it. It is worthy of remark, that lands which previously could not produce corn has, by the use of Gypsum, in the manner described, been able to raise good crops in the midland parts of France. The agriculturists of Alais may procure Gypsum, from Anduze, Salle, Rochebelle and Blauvès, to Drome it may be carried from Gard, and Ardeche. It is extensively employed in Canada, with the most happy results. It was tried in Yorkshire by Lord Dundas without any benefit, but the soil upon which it was spread was ascertained to contain a quantity of Gypsum. It might be employed, there can be little doubt, with great advantage in the border counties when the *trifolium pratense* has in many places failed. This plant necessarily from its strong and luxuriant nature, obviously must require a considerable quantity of the manure. If it be deficient in quantity the plants may vegetate, but must speedily perish from the effect of the first frost on their delicate structures."

## THE FLOWER SPIRIT.

BY AN AMERICAN POET.

I am the Spirit that dwells in the flower;  
 Mine is the exquisite music that flies,  
 When silence and moonlight reign over each bower,  
 That blooms in the glory of tropical skies.  
 I woo the bird, with his melody glowing,  
 To leap in the sunshine and warble its strain,  
 And mine is the odour, in turn, that bestowing,  
 The songster is paid for his music again!

There dwells no sorrow where I am abiding;  
 Care is a stranger, and troubles us not;  
 And the winds as they pass, when too hastily riding,  
 I woo, and they tenderly glide o'er the spot!  
 They pause, and we grow in their rugged embraces;  
 They drink our warm breath, rich with odour and song:  
 Then hurry away to their desolate places,  
 And look for us hourly, and think of us long!

Who, of the dull earth, that's moving around us,  
 Would ever imagine, that, nursed in a rose,  
 At the opening of Spring, our destiny found us  
 A prisoner, until the first bud should uncloze;  
 Then, as the dawn of the light breaks upon us,  
 Our winglets of silk we unfold to the air,  
 And leap off, in joy, to the music that won us,  
 And made us the tenants of climates so fair!

May 5, 1835.

Sir,—Having carefully perused the article on the Malt Tax in your paper dated 20th April last, and signed, Cymro, I beg you will allow me to make a few remarks on his observations, not intending to follow him through the whole. I shall only notice those in which your correspondent has thought proper to stigmatise the brewers, and those wherein the beer trade is more immediately concerned. He states “the habits and tastes of the lower classes were changed by taxing that beverage which had ever been the boast and favourite of Englishmen, advancing the quart of beer to 6d and 7d, which held forth such temptation to adulterate the article, that the community, after being compelled for many years to drink the most noxious liquor, composed of deleterious drugs as a substitute for malt and hops, gave it up in disgust.” Now sir, I must beg leave to state, that it was not the above reason that reduced the consumption of malt liquor, it may be traced to the tax on the beer after being brewed as well as the enormous tax on the malt during the war. I would beg to ask why such heavy taxes were imposed when it cannot be denied but the article is and ever will be the favourite of Englishmen, the fact may be stated that beer not being an article of consumption amongst the higher classes the beer tax was imposed by men who cared little about it, but the only luxury of the labourer it was suffered to be burthened until it was nearly out of their reach, and those persons (farmers) who ought to have been encouragers of the consumption of malt—were in fact the first men, as tradesmen who put a stop to allowing it to their labourers, and in process of time most other trades were obliged to follow the example, from the article being so heavily taxed as to amount nearly to 1d per quart. Independent of the heavy pressure of the malt tax during the war, being 34s 8d per qr., and at the rate of 3 barrels of beer from each quarter is nearly 1d per quart more, these causes were quite sufficient to deprive the poor man of even tasting his favourite beverage, the high price of wages and the pressing demand for labourers alone gave them the chance to enjoy it; now that labour is become a drug in the market, wages are so reduced that beer is more out of his reach than before. The chief reason of the present price of beer is the high price of barley, the malt duty bearing on each barrel of beer at the statu quantity of 3 barrels from a quarter of malt, is 6s 9d nearly, or a fraction above a  $\frac{1}{2}$ d per quart. Now, Sir, the statement is incorrect, when it is said there were only eight millions of barrels of beer consumed with a population of fourteen millions; the quarters of malt paying duty ending October 1833, was 5,020,599 $\frac{1}{8}$  quarters, or 40,164,793 bushels; taking 3 bushels of malt to each barrel of beer the number of barrels is 13,388,264. Now, Sir, the above number of barrels of beer from the stated quantity of malt is at the average of 4 $\frac{1}{2}$ d per quart in value. At the present price of beer sold at retail, it is well known that many thousand barrels of beer are sold much under the above quality, therefore the population cannot be considered to enjoy less than one barrel of beer annually each, though it must be acknowledged it may not be so strong in quality as in oldentime. That deterioration can be attributed only to the price of barley and some few other causes arising from the increased taxation, which most articles are subject to in the present day; the decrease of the quantity of malt is therefore more owing to the price of the barley

than to the tax on malt; [in former times the farmer had no such opportunities for the sales of barley as the last fifty years have given him. Ardent spirits had scarcely come into notice as a home manufacture; beer therefore was the chief source for the consumption of barley, and the low price enabled every one to allow a good quantity to every hogshead of his malt drink. Since the above time the manufacture of malt has very much improved as to its quality and produce, but how much indeed has the brewing trade improved during the last 50 years? it was then only a trade—a kind of rule of thumb business—now it is grown rapidly into a Science, and one which will be as long in being fully developed as any of the sister sciences. I should be very glad if your correspondent “Cymro” would have the candour to state the reasons for the insertion of his list of drugs; does he mean to tell us that they are used by the brewers, or to what other class of individuals does he refer to in his observations? Such an inference is as totally void of truth as his statement respecting the price of beer and malt and barley to which they are attached, and the fallaciousness of the greater part of his arguments do not in the least prove that if the Malt Tax was repealed that either himself or the farmers in general would again allow beer to their labourers as in former times. The statement copied from Sir R. Peel’s pamphlet or speech is also founded in error; where, I ask, is the farmer of 300 acres consuming 3 barrels of beer weekly? none I say, not one can be found in the three kingdoms; it is a fact well-known, that farm-houses, generally speaking, are without beer; as to the supply for workmen, let me see or know the farmer of 300 acres who can show a malt bill for such an amount as 150 barrels of beer yearly, even at 1 bushel of malt per barrel, this would be 19 quarters of malt at a cost above 25s per week for beer; it cannot be borne out, therefore, all arguments founded thereon are in error; the fact is, when during the war, corn sold high, and bank notes were in hand like songs, the farmer could hold his grain from the consumer till he could realize an enormous price; this opened the door to luxuries of all kinds; now we have none of the old-fashioned yeomanry—the former boast and pride of England—we have a degenerate race of farmers looking more to high prices and large farms than their forefathers, and expecting the produce of the soil to keep pace with their wishes and luxuries. Let them confine the extent of their farms to  $\frac{2}{3}$  of their capital and have the other  $\frac{1}{3}$  to work with; let the dairy, fowls, small pork, and veal furnish the household, then I will expect to see comfort return to the labourers and a kindly feeling towards their servants, both as regards their habits of industry, their morals, and how their leisure hours are passed, not as now driven to a cold comfortless cottage, but to sit smiling in their masters chimney corner after the toils of the day. Alas! those days are long gone by—never I fear to return to the peasantry of Old England. In conclusion, I beg to state, that malt cannot be manufactured at a less cost than 3s per qr.; the present year has proved that malt has averaged from 63s to 65s per qr., and good malting barley 38s to 40s; chevalier, 40s to 42s, with the malt tax of 20s 8d per qr.; where then has been the profit to the maltster, where is he to look for his delivery expenses, or his own and family’s maintenance, and as to the brewer who has all the fitting of an establishment and the charge of delivery of so bulky

an article,—where, I say, is the man who can show but that the price of beer is more ruled by the price of barley than any other cause, the malt tax as before proved being little above  $\frac{1}{2}$ d per quart? If the farmers would wish to reduce their burthens, let them join heartily in establishing cottage allotments in every parish in the kingdom; let no relief after a proper time (say one year) be given to any able-bodied labourers where he has had sufficient time to bring his little allotment to maturity, the poor-rates are far more burthensome to the land than the malt tax; and do not let the landed proprietor again delude the farmer by holding out the hopes of seeing the malt tax taken off unless it can be shown the expenditure of the country does not require it; begin reform in those things within your own controul and do not let that sweeping monopoly encroach all the land into farms, but leave a little plot to every agricultural labourer.

A CONSTANT READER.

### AGRICULTURE AND GARDENING IN JAPAN.

There is, perhaps, no country in the world so highly cultivated, nor any in which so much food is raised, on the same space of ground, for the subsistence of man, as in Japan; but unfortunately, the jealousy of the government is so great, as nearly to exclude strangers from the country, and render our knowledge of their modes of culture very slight and imperfect, from which, otherwise, much might be learnt, as they are conducted with much ingenuity, industry, and skill.

The land in Japan, as far as it has been seen by Europeans, is not, in general, remarkable for its natural fertility; it consists chiefly of clay or sand, but of course in so large a country there must be many varieties of soil. The land is cultivated by the spade and hoe; the plough is, however, sometimes used, and is either drawn by horses, oxen, or cows; even the steep sides of the hills and mountains are cultivated to their summits, which all travellers in that country agree, has a most pleasing and extraordinary appearance. They have no meadows, and very few fences to the fields, as the small number of cattle which they have are always kept the whole year in yards. The Japanese have no sheep, and but few horses, oxen, or cows, as they do not eat animal food, or use milk. The wheat and barley is sown in beds of about a foot in width, and the same space is left between each bed. The corn is either sown in drills the length of the bed, or in rows across it: when the young plants are from eight inches to a foot high, the earth is dug out of the space between the beds, and laid between the rows of corn, so that the fields have the appearance, when the corn is young, of cabbageseed-beds, with renches between them. The wheat is sown in November, and is ripe in June;—the barley is sown in Oct., and is ripe in May. As there are so few quadrupeds kept in Japan, every possible care is taken of whatever will form manure. The economy in this respect often rendering the country disagreeable, and even unhealthy. All the refuse of the houses is saved, either in large earthen jars, or in holes; this mixture is formed into a liquid hodge-podge manure, which is carried in pails, and poured from a laddle on the corn when it is about six inches high. This operation is performed twice to each crop of corn. The Japanese weed the crops of corn with the greatest industry; so much so, that Thunberg, who was a botanist, and

visited Japan in quest of new plants, complains that in a long journey in which he expected to collect many plants, he could hardly discover a weed in whole provinces.

Rice being the principal article of subsistence in Japan, the greatest pains is taken with its culture. There are several modes of cultivating it, according to the nature of the ground. The most common method is, in April, to turn over the ground with a hoe, then, by means of raised borders, the land is laid under water. The rice is sown in beds, and when the plants are six inches high, they are taken up in tufts or small clusters, containing several plants. These are planted in the rice-ground, about six inches between each tuft; this work is always performed by the women, who wade about in the water at least six inches deep. The rice is ripe in November, it is then mown, bound up in bundles, and carried home. The mere striking the ears against a band or any hard body, causes the corn to fall from the ears; but before the husk can be separated from the grain, a second thrashing or stamping is necessary; this is performed by placing the corn in a hollowed block of wood, forming a kind of mortar, and pounding it with a wooden pestle.

Besides the great use of the grain of rice, the straw is of much importance, as the Japanese make their shoes of plaited straw. A pair of these is often worn out in a day, if they are much walked in. When the weather is wet, and the ground muddy, they are most uncomfortable to wear. Their large hats are also made of plaited rice-straw.

Barley, wheat, and colaseed, are all thrashed in a plain and artless manner, on straw mats, in the open air, and frequently before the doors of the houses, with flails which have three swingles. Buckwheat is cultivated, and of this the meal cakes are made, which are boiled, and frequently coloured; these are sold very cheap in the villages, to travellers. Several kinds of beans, peas, and lentils, are cultivated in abundance. Turnips are cultivated, and they grow very large, but from the nature of the manure, they have a very rank and strong taste, and strangers do not like them, though the natives eat them in great quantities, both dressed and raw. The carrots are of a yellowish cast; only a few potatoes are grown. Among the esculent roots, batatas is the most cultivated. Melons, both white and red-fleshed, are grown, and pumpkins which are used for soup. Cucumbers, which are eaten both raw and pickled. Conomen for pickling; calabashes, or bottle-gourds for flasks. For seasoning, they cultivate a new species of ginger, and the pepper-shrub, of which both the leaves and fruit are used. Various sorts of mushrooms are in great request, and occur commonly in the shops, dried for sale, and are in daily use for soups and sauces. The buds of the yellow water buck-bean are steeped in brine, and used for pickles. They also cultivate the red beet, fennel, radishes, dill, anise, parsley, asparagus, leeks, onions, black radish, lettuce, succory, endive, and many kinds of esculent vegetables not known in our gardens. The Indian kale is cultivated to a considerable extent, out of which the Japanese express oil for their lamps; in April, when it is in flower, the fields have a most pleasing appearance from the yellow blossoms. The sesamum is grown in many parts of Japan, and from the small seed an oil is expressed, used there, as in India, for dressing the food. The cotton or tea plants are cultivated to a great extent; also the varnish-

tree, the camphor tree, the mulberry for the numerous silk-worms, and many kinds of forest-trees, some of which are peculiar to Japan. The desserts in Japan consist of many kinds of well-tasted fruits, which are cultivated in the gardens. Shaddocks, Seville and China oranges, pears, apples, plums, cherries, medlars of a very delicious taste, figs, grapes, pomegranates, Spanish fig, chestnuts, walnuts, nuts of several sorts, some of which are peculiar to these regions; two sorts of barberry, and several fruits not known in Europe.

Most of the natives of Japan take great delight in their gardens, and cultivate with much care, many kinds of flowers, and plant flowering-shrubs before their houses, and also form hedges of shrubs about their farms, on account of their beautiful blossoms. Nothing can exceed the beauty of the hedges of the maples indigenous to this country.

Like their neighbours the Chinese, the Japanese are very fond of double flowers, and have an endless variety of double-blossomed peach, cherry, plum, and many other varieties. They also plant dwarf trees in flowerpots, often with pumice or other porous stones, instead of earth. It would be endless to enumerate their favourite plants; of the Azalea and Chrysanthemum, they have numerous beautiful varieties.—*Abridged from Paxton's Horticultural Register.*

### AGRICULTURAL DISTRESS.

TO THE EDITOR OF THE LINCOLNSHIRE CHRONICLE.

Sir,—At a time when the whole country is anxiously waiting to see the formation of the new ministry, I fear the interests of the Agricultural population will be forgotten, and as the rent days are at hand, and we hear not of any relief which may be afforded to the suffering tenant, may I beg again a corner of your columns for a few observations? Surely, Sir, the landlords should look down upon us from their exalted state, and viewing their own interest interwoven so closely with ours, extend in time that aid which we so much need and which they alone can impart. Is it not cruelly tampering with us to repeat the existence of our distress in speeches from the house, put into our most gracious Majesty's mouth, and lead us to expect something in mitigation of our overwhelming calamities, and yet suffer us to continue increasing difficulties, and to grapple with warrents whilst wheat makes 35s. 36s. or 37s. a quarter!

I don't know whether you are acquainted, or whether our landlords are acquainted, with the fact, that it is the practice of farmers in general, particularly those of old standing, to make the "wheat-hovel" at harvest to meet the rent day in May. This wheat-hovel or farmer's sign-post is just at the present moment being removed, some have threshed it, some are in the act, and others are preparing for it. Now, Sir, if I could prevail upon those noblemen and gentlemen, clergy, and others, who, perhaps, even whilst I write, are fixing the time for receiving their rents, just to stop a moment and reflect upon our condition:—"the hovel," containing fifty quarters, should pay the half-year's rent of a tolerable farm, but at 36s. per quarter, and 2s 6d a quarter threshing, makes a little over four score pounds! How is it possible, therefore, to meet the rent of 200 or 250 acres of land at 28s. an acre? Why, I don't fear the jeers of any who may be pleased to call me a prophet when I declare, that eight out of ten of the tenant farmers can no more pay their rents after this rate, than they

can measure the moon, and that, notwithstanding the deaf ear to all remonstrance which appears to be turned towards us, the time is speedily coming when the land must be occupied by other hands than the present race of farmers, and we must (most or many of us) be the inmates of the poor-houses which are about to be erected under the new poor law bill.

What then must the landlords do if tenants cannot be found for their farms? Would it not be far better for all and every class to meet the case by a timely reduction of rent, and not persist in the abominable practice and unprincipled subterfuge of returning the paltry ten per cent., merely to keep a sort of flattering prospect to the already half-ruined tenants? Would to God! attention were drawn to this subject before the dreadful crisis appears but too vividly before our eyes.

I am, Sir, yours very truly,  
April 18, 1835. AN OLD FARMER.

### ON THE COCKSCOMB.

This is the season to commence the culture of this exquisite stove annual, which, if conducted under very favourable circumstances, may produce flowers of surprising magnitude. We have read of specimens (indeed, the descriptions are now before us), one of which was stated to be "thirty-six inches over, fourteen inches in length, and eight inches and a half in width;" of another whose stem was only thirteen and a half inches high, which bore a flower twenty-eight inches long from point to point, twelve inches broad, "measuring the convolutions," that is, if opened out flat, would extend to "ten feet and a half." Such giants have not come under our own observation, and we hesitate not to assert that none of our readers will ever succeed in an attempt to produce them, or any flower of extraordinary dimensions, unless seed of peculiar quality be obtained, and raised with extraordinary care and judgment. One fact, however, we must adduce, to dispute which would be to "doubt truth to be a liar." Mr. Knight, the President of the Horticultural Society, sent a cockscomb, a drawing of which is in the rooms of the Society. "The flower was eighteen inches in length, and eight inches in width. It was grown in a compost of chopped turf, of the rich alluvial soil of a river side, mixed with wholly unfermented pure horse-droppings, and a small portion of the ashes of burnt garden weeds. These general directions will lay the foundation of successful practice. The cultivator may begin by sowing the best seed in a shallow pan, containing chiefly the earth of decayed leaves, and a little fine sand, and placed in a damp pine pit, or frame, over a good common dung-bed, earthed over. The young plants, when an inch or two high, should be removed singly into pots two or three inches wide, containing a similar soil, enriched however with one-third of good loam. The pots must be kept in close, moist heat, and the plants shaded till they have established their roots. Water of the temperature of the bed is to be supplied cautiously, but regularly; and when the plants have filled the pots with roots, they are to be transferred to pots of a size larger. In these the plants may remain till the flowers be formed, when they should be removed to the soil employed by Mr. Knight, placed in pots six inches across, inside measure. If kept in the moist heat of a pine pit, regularly supplied with tepid water, and once a week with liquid manure, prepared by steeping a peck of sheep's dung in six gallons of boiling water, holding an ounce or two of chrystallized soda in solution, and suffering it to cool

and settle, fine flowers will assuredly be procured. Gigantic specimens may remain a rare curiosity, but plants of handsome growth, with short stems, large leaves, and gorgeously tinted flowers will be supplied in abundance.

#### METHOD OF DESTROYING MICE, &c., IN THEIR LURKING PLACES.

M. Thenard, in 1832, submitted to the Academy of Sciences a plan for destroying noxious animals, when they have taken refuge in their hiding places. The instrument of destruction is sulphuretted hydrogen, which he had remarked to be peculiarly deleterious to animal life. Animals when allowed to breathe the pure gas fall down as if struck with a bullet. Even when considerably diluted with atmospheric air, the effects are deadly. A horse dies in less than a minute, in air containing 1-250 of this gas. A dog of moderate size is speedily killed in air containing 1-1000, while a greenfinch expires in a few seconds in air possessing 1-1500 of sulphuretted hydrogen. Influenced by these facts, the French chemist proposed the employment of this gas to several individuals for the purpose of extirpating noxious vermin, but his suggestions being treated with indifference, he determined to put the method in practice by his own experiments.

His first trial was in an apartment infested by rats, which showed themselves occasionally during the day, and at night were actively engaged in plundering a chest of oats, to which they had access through an aperture of their own formation. The holes by which they retreated amounting to eighteen in number, Thenard adapted to each of them in succession retorts capable of containing half a pint measure, by introducing the beak of the retort and filling up the interval round its neck with plaster. Sulphuret of iron was deposited in the retort, formed from a mixture of iron filings, sulphur, and water, and dilute sulphuric acid was introduced by means of a tube placed in the tubulure. The sulphuretted hydrogen was disengaged with great rapidity, and in a few minutes not a rat remained alive in the building. His next experiment was in an old abbey where he was equally successful, and having opened up part of the wall he found many dead rats. He recommends the application of this method to the destruction of moles, foxes, and all animals which cannot be extirpated by the usual means. Thenard then gives popular directions for the formation of the materials required to produce the gas.

Mix four parts of iron filings, three parts flowers of sulphur in a mortar with a pestle. Place the mixture in a convenient vessel, and moisten it with four parts of boiling water, stirring it with a piece of wood or glass. Add gradually afterwards four parts more of water, and introduce it into the retort. Pour upon the mixture common oil of vitriol diluted with five times its volume of water, and continue to add it gradually till the effervescence ceases. Should any of the gas escape into the apartment and occasion inconvenience, it may be removed by dropping a little sulphuric acid upon bleaching powder. The holes should be closed immediately, to prevent the disagreeable effects of the putrefaction of the carcasses of the animals which have thus been destroyed.—*Translated from the Annales de Chimie, in Dr. Thomson's Records of Science, No. 1.*

#### THE RUSSIAN SERF.

The bonded peasant is bound to pay undeviating obedience to his lord, to render due service to him, (which service the law has fixed at three days in the week for each married couple,) and to pay the tribute which his lord imposes upon him. The public authorities are bound to lend their aid to the lord at all times. The bondsman is not, however, compellable to obey any orders contrary to law which his master may require him to execute. He cannot marry without the consent of his master, nor can he be forced to marry against his own inclination. If there be any want of marriageable females on an estate, or the whole peasantry are allied by blood, and a neighbouring lord be possessed of such females, in such case the purchase of females may be effected; and in cases where neither the lord nor his peasants have sufficient pecuniary means wherewith to make this purchase, the buyer may agree with the seller to place an unmarried female at his disposal for every female he may deliver to him. Both the lord and his peasantry are responsible to the government for all public imposts, and the peasantry are personally liable for the poll-tax, for all burdens imposed on the land, and for the furnishing of recruits. The lord is bound to provide for the maintenance of his peasants, and cannot exact greater service from them than three days' labour per week. Grown-up children, so long as they are single, are not legally liable to do service; but this regulation is not in general much regarded. In case of need, the lord may compel his peasants to dwell under his own roof, or on his own farm, and employ the whole family in working for his support. The peasant cannot enter a complaint against his lord; nay, all his acts become null and void if the lord appear or plead in court; but he may denounce his lord for high treason and false returns of the numbers of his serfs. Though there may be no express law giving the lord a right of disposing of his peasants' property, the denial of a hearing before a public tribunal and the ancient laws respecting slavery are bars to any remedy which the peasant may seek. The head of every province is bound to prevent or punish the commission of any acts of tyranny, and may place the affairs of the lord in trust. It is not lawful for a peasant to change his place of residence; runaways must be delivered up to their masters; the lord has power to punish the peasant, but neither with starvation, maiming, nor death; he can make a recruit of him, send him to the house of correction, and compel him to settle on his estate wherever he thinks proper, if he be not fit for service. Compensation is due to the lord for every peasant slain by design or accident. The lord may emancipate his peasant and also sell him with or without any land; but he cannot separate him from his family, nor dispose of him publicly to the highest bidder. Custom, however, has gradually modified many of these oppressive enactments; and the harshest treatment to which the serf is exposed takes place on the estates of small proprietors.—*Treatise on the general Laws of the Russian State. St. Petersburg, 1833.—Translated in Journal of Education, No. XVIII.*

TRIFOLIUM INCARNATUM.—(From Cobbett's Register.)—Much interest was excited last spring by an account that had been published of the excellence of the *Trifolium incarnatum*, or Italian clover. It was represented as a thing to be sowed after wheat,

and as yielding a fine crop fit to cut up for horses, in the month of May. I had some seed from Liverpool, for which I did not pledge myself, and which proved to be of a good-for-nothing sort; but I had also some seed of the true *Incarnatum*, which I gathered from the plants in the Isle of Wight; and the interesting questions were first, whether the *Trifolium Incarnatum* would stand the winter in England; and next, whether if it did stand the winter, it would produce a greater crop to be cut up for horses in the month of May, than the broad clover. We heard of very fine crops of the *Incarnatum* last summer; of beautiful fields of it; and, I dare say, that they were beautiful enough; for the plant has long been cultivated in the flower-gardens for its long stalks of beautiful red flowers. But, it was for the fields, and for the horses, that we wanted it; and, I have given it a full and fair trial against the broad clover, and against other grasses, the result of which trial I am now about to state. On the 19th of May last, I sowed, in good and clean ground, a patch of the *Trifolium*, one of broad clover, and one of *Lucerne*. The *Lucerne* I cut four times last summer each time about two feet high; the broad clover I cut twice; but those two cuttings exceeded the four cuttings of the *Lucerne* in weight. The *Trifolium* I suffered to get to its full height, and be in bloom. It did not yield in weight a fourth part of the weight of the broad clover; and the plants died at once, proving the plant to be an annual as much as wheat is an annual; while the broad clover, after its two cuttings, went on to shoot again, stood the winter and is now (8th of April) very flourishing, and about four inches high; and as to the *Lucerne*, it is, at this time, eighteen inches high; will be in bloom by the first week in May, with a prodigious weight of crop. Gentlemen will perceive that my ground is good, warm and early; but they will also perceive, that the *Trifolium Incarnatum* had the same ground as the other plants. It was precisely the same, for the *Incarnatum* stood between the two others. But the *Incarnatum* was to be sown after wheat; that is to say, in the month of August, or September. Now on the 28th of last August, I sowed in clean ground, without manure, but very good ground, twenty-six sorts of plants called grasses, the first four of which were, the broad clover, the *Trifolium Incarnatum*, White Dutch clover, and *Lucerne*. At this moment the broad clover, and the White Dutch clover, are five inches high, and exceedingly flourishing; the *Lucerne* is a foot high, and rather more; the *Trifolium Incarnatum* hardly rises boldly up from the ground; and, if cut, would not weigh a sixth part of either of the other three. Here is same time of sowing, same ground precisely; same winter to stand; same spring to start in. I shall let all these plants stand as they are until the first week in May; and then cut them and weigh them; but I need do nothing more and see nothing more than I have already done and seen, to convince me that this plant will not be cultivated in England, except in the flower gardens. This experiment convinced me, that to sow broad clover in clean and good land, after wheat, is the way to have abundant crops of green food to cut up in May. However, this is another matter.

#### TO THE EDITOR OF THE HEREFORD TIMES.

Sir,—A friend of mine has forwarded me your valuable paper, to answer a letter of "J. W." dated "Ledbury, March 25," which you inserted, and to which I ought to have replied before this.

It is known to all parts of England, that Sussex management of sheep is not excelled, which, perhaps, may be attributed to the talent of the late celebrated breeder, John Ellman, Esq., who raised the character, through the best of management, of our Southdowns, to an extent unequalled. Just before the death of that gentleman, a publisher, at Lewes, was assisted in an agricultural work by him, and the public were furnished with a perfect treatise on the Raising and Breeding of Sheep, and Means adopted in General Management. This treatise is published in that valuable work, entitled "Baxter's Library of Agricultural and Horticultural knowledge," and from which I take the following extract, in answer to "J. W." The recipe is excellent, and my shepherd invariably adopts it.

#### THE FLY.

Price, speaking of the fly, says, "it may more properly be termed an injury than a disease, as it may in general be prevented by moderate attention."

"There are two or three sorts of flies that are said to strike sheep, viz., the black, the white, and the greenish fly. The maggots generated from the ava of the first, or black fly, are deemed the most destructive to sheep; this fly is later in making its appearance than either of the others. I have heard it asserted by an experienced breeder, that a considerable difference is observable in the appearance of the maggots:—those from the white and green fly being white, while those of the black fly partake of a black colour. Sheep that have been once struck with the fly are more liable than others to be attacked on the following year, as are also such as have a foul skin."

"This injury may sometimes be discovered from the marks left on the skin by the blows of the fly, but when such marks are not present, it is readily discovered by the motion and appearance of the animal."

"A sheep troubled with maggots betrays constant uneasiness; it hangs down its head, and appears in a listless posture; it moves its tail in a peculiar manner, draws up its body, stamps its feet, runs a short way, and then suddenly stops, and frequently attempts to tear or bite the injured part."

"As soon as the symptoms shew themselves, the wool should be removed from the part with the shears, and, afterwards, the maggots carefully picked out; this, and rubbing a little grease on the wound, is the only method had recourse to at Romney-marsh. In very bad cases, spirits of turpentine, white lead, train oil, and assafœtida, have all been recommended, and, I have no doubt, all prove noxious to these vermin."

"Some graziers recommend gouldard water as a wash for the affected parts, and others, a mixture of train oil and brimstone; but the best remedy I am acquainted with, and that which proves least injurious to the wool, is an ointment composed of the flour of sulphur and butter, or lard, a sufficient quantity of which should be well rubbed in with the hand."

"It is my opinion, that a sheep once struck should never be kept to breed from, as they are nearly certain to be struck again with the fly the next year. I would not even save a lamb from a ewe that had been struck, as it originates, I believe, generally, from a foulness of the wool attracting the fly. By attention and close watching, I rarely had a sheep struck with the fly at Glynde; and I am persuaded it always prevails to a greater extent in those where little at-

tention has been paid to breeding, and especially from sheep once struck.

"In enclosed situations I have known sheep affected with the fly, and particularly those which are not well covered with wool between the ears. Having got rid of this and other defects by breeding, few of my sheep have been attacked."

Such are the opinions of this celebrated man, and upon these opinions I have regulated my management, with great satisfaction to myself. If sheep are properly dipped with the sheep mixture, there is but little to be apprehended from the fly. The washing appears to me to be the great preventive; and if "J. W." is unacquainted with this, I must refer him again to "Baxter's Library of Agricultural and Horticultural Knowledge," p. 579 of the third edition. I would extract this recipe, as it is valuable; but space is wanting. Trusting the above observations will be of equal advantage to "J. W." as they were to me, I remain  
A SOUTHDOWN FARMER.

Goreing, Sussex, April 15, 1835.

## HOW TO THICKEN THORN HEDGES AND PRODUCE BRANCHES ON TREES.

The objects of the experiments related in the following paper, (which we have gathered from the Transactions of the Highland Society of Scotland,) was to procure lateral branches from the bare stems of thorns, and other ligneous vegetables; and the result being stated as satisfactory, it is only necessary to explain the manner in which it has been effected. The sap, in circulating or ascending, naturally moves along the bark of a bare stem of an even surface, without any tendency to develope lateral shoots; but the temporary interruption of the course of the sap in thorns, as it is known to do in other plants, seems to give an impulse to inactive germs, by which lateral branches are produced; and therefore, in point of beauty and utility, the discovery is important.

A thorn hedge, when properly managed, surpasses in appearance and durability any ordinary fence. But they never succeed in situations where they are exposed to too much moisture, or where the soil is arid: and in cold exposed situations their stems become covered with grey lichens, indicative of an unhealthy condition. When such cold soils are not trenched previously to planting, hedges and trees make slow progress, especially where the ground is stiff, and opposes the shooting of the roots. Very light gravelly soils are also unfavourable to the growth of thorns. But the greatest error usually committed in rearing thorn-hedges, is the neglect of keeping them clean and properly trimmed when young, so that at last the hedge becomes as broad as it is high, or looks like a canopy supported by bare sticks, on account of being choked at the roots by weeds. No hedge looks so neat or lasts so long as one kept nearly in the form of a stone wall, the proper dimensions being from three to four and a half feet in height, from one to two feet in breadth or thickness at the base, inclining upwards, until at the top its diameter is only a few inches.

But when neglected, as already said, it has hitherto been considered an irreparable evil attendant on thorn-hedges, as respect their bushiness at the root, that they are scanty and bare, and not to

be remedied but by cutting the whole close to the ground, and training it anew, which though efficient is a slow style of amendment. On a farm near Stirling a farmer tried a new method of renovating his hedges, where many of the thorn stems were almost entirely destitute of lateral branches within two feet of the ground. This he accomplished by making horizontal and semicircular incisions in the bark, by which from a quarter to half an inch in breadth of both layers of the bark was removed fully half way round the stem. In a few weeks after, buds appeared and shot forth, usually close under, but sometimes over the incisions. This simple operation, performed by a hedge-bill or a pocket knife, early in spring, does not seem to injure in the least the thorns, for the cut being clean and not deep, no canker ensues, and it soon closes up again, leaving only a slight scar in the place; care must be taken, however, that no shred of the inner bark remain to continue the circulation. The partial interruption merely causes a lateral exertion in the sap vessels to overcome the obstruction, and the sap thus accumulated gives rise to the new branches, so that the stem may be cut at two or three places if necessary. The artificial branches seldom failed to appear where the stems were healthy, and have sometimes attained a length of two feet the first season. But as such tender twigs are apt to be hurt by frost, if cut too young, they were not touched till the first or sometimes the second spring after, when such as required it were cut off a few inches from the stem, which caused an immediate subdivision of each branch. Thus, the ragged ill-filled hedges of this gentleman have been continued at the regular height, and at the same time trained into a uniform breadth and thickness, not attainable by any other method, in the same space of time.

Having succeeded so well with the thorns, he tried afterwards an experiment on a few forest trees, about six inches in diameter. The incisions were made about six feet from the ground, and, in some instances, immediately above slight swellings, which indicated a tendency to shoot forth branches. The consequence was, that a new branch sprang forth the same season, from almost every one of the trees. In the thorns, however, no search was made for these eyes, and few or none were observed. The object in these last experiments was to ascertain whether a tree, intended to be ornamental, but which had been forced up by close planting to a long pole, might be made to assume a luxuriant appearance; and, so far as this gentleman has proceeded, it appears that his attempt has been followed by the desired effect.

JOHN WOOD.

Stamps and Taxes, May, 1. 1835.

## ON IMPROVING THE BLOOM, AND PRESERVING OF CERTAIN FRUITS.

Mr. Robert Gauén, gardener, at Milbrook, near Southampton, some years ago published a method of improving the bloom of certain fruits, which is worthy of the notice of those who have an interest in ornamenting, preserving, and packing such articles, and to which we beg to renew attention. Ten years' experience, and the award of many prizes for show fruits, have conferred on Mr. Gauén singular skill in this branch. The delicate bloom of the cucumber, its length, girth, and straightness, are, as is well known, important considerations, among florists and growers of prize fruits. For these purposes the cucumber must be protected from the drip of the lights, from the period of its blossoming, and from the damp of the soil by two pieces of glass, about four inches wide, and from eight to a dozen long; the one placed under the fruit, and the other supported on pegs over it; both having a slope to one end, to carry off any condensed damp.

To procure the straightness of a gun barrel, a slender and lengthy form of the cucumber, instead of supporting the upper glass on pegs, lay on the under glass, alongside the young fruit, two pieces of wood about the length you suppose the cucumber may grow to, about two inches square, and with the upper inner angle of each piece bevelled off. The solar heat is increased by these pieces of wood throughout the day, and by close confinement during the night, the fruit is conducted to considerably more than its natural length. The mode of securing elongation is attended with small prickles placed at greater distances than is desirable in a handsome specimen.

To ensure shape, prickles, and bloom, the foliage of the plant must be kept moderately thin. Never wet the fruit in watering the plants. Before cutting it, be careful that it is perfectly straight, at least a day previously, for this operation can never be so well conducted as when the fruit is on the plant. In straightening warped fruit after it is cut, let it be kept in a cool dry place, and excluded from the change of air. Mr. Gauén merely kept them in their show-box, in a cool, dry room.

His straightening process is thus:—Take a flat board, half an inch thick, four inches broad, and the length of the cucumber: bore holes at intervals of half an inch across the board, and within one inch of each end. Provide two strips the length of the board, one-half inch wide one-fourth inch thick; place one strip on edge, supported by a peg placed in one of the holes outside the strip that is on edge, and put the board under the growing fruit, with the two ends of the arc formed by the crooked fruit against the upright strip; place a bit of cotton wool or moss between each end of the fruit and the upright strip, to prevent bruising. Then take the other strip and bring it within a peg placed at one end, with a bit of wool or moss placed against the outer arc of the crooked fruit as before. Proceed to straighten the fruit with one hand, straining it by the strip (keeping the whole steady with the other), towards the fixed upright strip, so as to bring it in a straight direction, and fix another peg. In ordinary cases the cucumber may be made perfectly straight at the first operation; but in some instances it requires two or three. A fruit may be straightened at any period of its growth, but it requires to be left one night under training, after the operation, to prevent its return to crookedness.

The bloom of the fruits, which suffers by this

operation, may be restored; which Mr. Gauén accomplishes by the use of a box with sliding and false bottoms, a common powder-puff and some finely calcined and perfectly dry magnesia. In packing, if there are more tiers of cucumbers than one, they must be kept apart by these false bottoms, being supported so as not to injure the sub-jacent fruit.

To preserve bloom on the grapes, complete the thinning of the berries when they have gained half their size, and do not dash water violently against them, or subject them to a current of steam. Abundance of sun and air are favorable for the production of bloom, neither will a moderate degree of shade injure them. When grapes with delicate bloom are gathered, they should be placed in a basket of well threshed moss, taking care not to bruise any of the berries. To restore the bloom to them, work the puff at intervals of an hour or two, in the blooming box.

Grapes require more care in packing than any other species of fruit. Mr. Gauén recommends moss and cotton wool, the former well threshed and picked; place a layer of moss at the bottom of the box; on this a layer of cotton wool; and next the bunches, side by side, within half an inch of each other; fill the interstices with cotton wool, place a layer of the same material over the fruit, and finish with moss. A false bottom supported by the sides of the box, may next be introduced, and the operations repeated. When the bunches are very large, it is necessary to interpose splints of whalebone through the heavier parts of the bunches, to support them on the sides of the box, or on the interstices of cotton wool.

Of grapes it may generally be said, that the berries of the best flavor and color are those of the first ripened bunches (of the bunches at the root end of the vine,) and of the lower extremity of the bunch. Unlike many other fruits, they do not improve in flavour after gathering, and unripe bunches do not become riper after they are removed from the vine. In selecting bunches, avoid those where any, or even one of the leaves have been removed near the bunch from the tree, because the berries will there be of inferior flavor.

Plums, peaches, nectarines, apricots, and figs—indeed every fruit which has a bloom—may be treated, in such a box as Mr. Gauén describes, with the puff and calcined magnesia. We should have before mentioned, that the false bottoms in his box consist of fine wire gauze, and by a particular process, which cannot always be conveniently followed, he raises a cloud of the powder, which most delicately covers the fruit. It seems remarkable that a white powder should give bloom to fruits of different colors; but the color resides in the skin, and the bloom is merely a semi-transparent colorless powder. Mr. Gauén considers magnesia as merely a powerful antiseptic, and being preferable to any other article, because it is neither offensive to the taste nor deleterious in any shape.

**GRAFTING APRICOTS.**—At the last meeting of the Horticultural Society, Dr. Lindley, the Secretary, read some observations "on grafting apricot trees." In the cases in which grafting fails, it is owing to young scions being used, and the tree being highly excitable, the principle of vitality is exhausted before proper adhesion has taken place. This result does not occur when wood of two, three, or four years old is employed; and in this case the proper adhesion always takes place. In wood of

three years old the best result is always produced; and by using that of this period the grafting of apricots will produce as certain results as that of any other tree.

### FEMALE EMIGRATION.

Mr. Parker, in a new edition of his work upon Van Diemen's Land, says:—"Colonel Arthur, the Governor of Van Diemen's Land, in a despatch to the Secretary of State for the Colonies, dated 26th September, 1834, says—'I have much pleasure in bearing testimony to the circumstance that the females who have arrived on this occasion (the Strathfieldsaye) are of a very superior class. Two-thirds of them were provided with situations in one week after their landing; and it is believed that the whole of them would have obtained employment before the expiration of a fortnight, but for the occurrence of an interval of unfavourable weather.' The Ladies' Committee speak of the young women who arrived by this ship in similar terms of approbation, and add, 'that both the emigrants themselves, and the persons who have engaged them, are alike mutually pleased with their several services and situations.' The Governor has transmitted a list of the wages and salaries of 160 young women who arrived in this ship, and from this list it appears that—

|                         |                         |
|-------------------------|-------------------------|
| 4 obtained £6 0 per an. | 7 obtained £16 0 pr an. |
| 14 ..... 8 0            | 3 ..... 16 16           |
| 1 ..... 8 8             | 2 ..... 18 0            |
| 25 ..... 10 0           | 2 ..... 20 0            |
| 3 ..... 10 10           | 3 ..... 21 0            |
| 1 ..... 11 0            | 3 ..... 25 0            |
| 49 ..... 12 0           | 2 ..... 26 5            |
| 4 ..... 12 12           | 3 ..... 30 0            |
| 5 ..... 13 0            | 1 ..... 31 10           |
| 16 ..... 13 10          | 1 ..... 40 0            |
| 2 ..... 14 0            | 2 ..... 75 0            |
| 8 ..... 14 14           | 2 ..... 75 0            |

Of these seventy-one were servants of all work—the youngest of which class, fifteen years of age, obtained 6*l*; whilst the highest wages obtained, by one thirty years of age, amounted to 30*l* per annum. The wages of house-maids and nursery-maids varied from 8*l* to 21*l*; of cooks, from 12*l* to 16*l*; of laundry-women, from 12*l* to 14*l*; of needle-women, from 10*l* 10*s* to 20*l*. Several young ladies from this ship obtained situations as governesses, their salaries varied from 20*l* to 40*l* per annum. The sudden influx of so many young people into a small community would, naturally, have the effect of depressing wages for a limited time: emigrants may, therefore, feel confident that wages will not fall below those above mentioned.

### RUTLAND AGRICULTURAL SOCIETY.

The Spring Meeting of this Society (for the show of cart stallions) was held on Monday, the 6th of April, in the Riding-house, Oakham. The attendance of horses was large, many having come from different counties to compete for the liberal premium offered. To the best cart stallion that shall attend at Oakham once a week during the season of 1835. The premium was awarded to Mr. Daniel Housin's horse, Oxford, and Mr. Billing's horse allowed to be the second, and succeeding horse, in case the winner should neglect the restrictions laid down by the society. The judges, Mr. John Wright, of Halstead, Leicestershire, and Clark Morris, Esq., of Oakham Grange, Rutland, also

commended the following:—Mr. V. Stapleton's chesnut horse; Mr. Berridge's black horse; R. W. Baker's, Esq., Suffolk horse, Rutland Plough-boy; and Mr. King's black horse; all of which were of a superior kind. Several others were shown in addition to the above. After the business of the day was gone through, a large party dined together at the Crown Inn, John Painter, Esq., in the chair. It is an important fact to state that the premiums of the above society for the present year, 1835, amounts to no less than *one hundred and fifty pounds*; there are three classes open to all England, namely, class 1, 7, 11, under certain conditions, contained in the society's bill of 1835, which may be obtained by any person applying to the Secretaries, at Oakham, Rutland, on or before the 16th of November, 1835, the day all certificates are required to be sent in.—Class 1, for oxen or steers of any breed or weight, under five years old, without restriction as to feeding; a premium of fifteen sovereigns to the best. Second best, ditto, seven sovereigns.—Class 7, for long woolled fat weather sheep, one year old, without restriction as to feeding. To the best pen of three, under twenty-two months old, a premium of seven sovs. To the second best, ditto, three sovereigns. Class 11, for pigs of any breed or age, weight above twenty stone. To the best fat pig, a premium of five sovereigns. To the second best, ditto, two sovereigns. The following sweepstakes are also open to all England, which close on the 16th November, 1835:—A sweepstakes of two sovereigns for the best beast, of any breed, age, or weight. A sweepstakes of one sovereign, for the best pen of three sheep, of any kind, breed, or age. A sweepstakes of one sovereign for the best sheep, of any kind, breed, or age. A sweepstakes of one sovereign for the best pen of five breeding ewes, of any breed or age, that have suckled lambs up to the 1st July, 1835; and that have been fed on grass and seeds only, for six months previous to the time of showing.

Mr. Editor,—The cultivation of Indian corn has for a number of years been, with me, a subject of great and increasing interest, and the season is at hand when the crop of the year must be committed to the soil. I feel confident that the introduction of this important plant ought to be general, and therefore I hasten to address you. I have read many arguments *pro* and *con* upon the question—have heard and read many a bold assertion; but as I am identified with it, have cultivated the vegetable for a series of years, have brought it, by a process of impregnation, to a greatly improved state, I rest my cause upon decisive facts, which admit of no appeal; and some of these I shall, without further preface, intrude upon your notice, and that of your very numerous horticultural friends.

*Indian corn*, or *maize*, has long been grown in England, the recorded year of its introduction from America being 1596. It is mentioned (as having been successfully grown in Essex) in that useful miscellany, *The Family Receipt Book*, published about forty years since. M'Phail gives directions for its culture in the early editions of his *Gardener's Remembrancer*; and other authorities might be quoted; but till Mr. Cobbett announced the variety which has since borne his name, it had not been thought of as a grain crop. My object, now, however, is not to recommend it as such. No one injures a cause more than he who endeavours to prove too much. As a succession crop of the farm, and a most profitable one, I know it

could be grown in four seasons out of five. But as the farmer would find himself on new and untried ground—as the ears, or cobs, become mature in succession, and cannot be pulled or cut at any one time, I shall not urge it, in the present state of our experience, as a staple farm product, but confine myself to those operations and results which admit neither of question nor doubt. Indian corn is in a state of progressive acclimatization. It is capable of manifest improvement: its constitution can be regulated and rendered more hardy, and its product abundantly increased. These are points which my experience has established; for, by four successive annual sowings I have effected the crops, I have effected the (at least partial) hybridization of three *distinct* varieties, have more or less hardened the constitution of one of them, and have so increased the yield of the other two, that, in lieu of from 150 to 220 small, or medium-sized grains in each year, I have now from 200 to 300 grains, of increased size.

As a garden vegetable, this grain is really an acquisition, and, for the food of pigs, turkeys, and fowls, it is invaluable: I have, within an hour's walk from my residence, an evidence of the fact, of a most conclusive character: this I published in the last number of the "British Farmer's Magazine." The corn on an acre and a half, in an open field, had fed, to repletion, 40 or 50 turkeys, had fattened and brought to the most perfect condition several porkers, and yet retained such a vast supply of ripe ears, that the cultivator has resolved to raise double the quantity during the present season, for the uses of his farm and poultry-yards.

Its mode of culture may be described in a few lines. Let small trenches be dug, a yard apart, about nine inches deep, and a foot wide, in a plot of sandy loam (as for celery), and if these be laid out so as to point due north and south, it will be all the better. Bury in the bottom of each trench three or four inches of good spit dung, then return the soil, and the plot will be ready. The period of sowing is according to the climate, from the 21st of April to the 15th of May. Soak the seed for 24 hours if the season and soil be very dry; and then strike a drill with a hoe, along the centre of each trench. Water the drills thoroughly, and drop in a seed at every six inches; cover with fine mould, and when the plants rise, and have become three inches high, hoe the ground about them. As they advance draw earth to the stems; and when they have thus been moulded up to the height of six inches, dig the central ground a spit deep, in which it would be very advantageous to bury as much manure as was employed for each trench in the first instance. If hybridization of three varieties be aimed at, vary the mode of sowing by dropping three seeds in a small triangle, one at each point, five inches from its neighbours: the triangles ought to be eighteen inches asunder, centre from centre. In the drill-planting, if the seeds rise well, the plants must be thinned out, so as finally to stand a foot from each other; and to secure the seed, it would be prudent to sprinkle soot over it, before the fine earth is added. Enough has been said to assist the inexperienced grower during some weeks; and I hope to recur to the subject.—I am, Sir, respectfully yours,

THE AUTHOR OF THE "DOMESTIC  
GARDENER'S MANUAL."

April 21.

## CAPE OF GOOD HOPE WOOL AND SHEEP.

The commercial advices received from the Cape of Good Hope refer to the incursion of the Caffres with the more regret, independently of the loss of life and property that has taken place, as it will tend considerably to retard the very active exertions which were in progress for improving the growth of fine wools in the Colony, to which the attention of the agriculturists has recently been directed with the greatest earnestness. In order to increase the character of the wool at the Cape, several investments had been made in the purchase of the finest Merino and Saxony sheep, importations of which had occurred in the Colony just previously to the incursion of the savages. The great success that had attended the breeding of sheep in New South Wales, where the recent advices from thence state the flocks were rapidly improving, had increased the desire of the flock masters at the Cape to improve their sheep. The arrival of the consignments of fine woolled sheep at the Cape from New South Wales and Saxony had created much satisfaction, and a confident feeling existed that fine wools would soon become the staple article of export from the Colony. The rams and sheep imported into the Cape had been most carefully selected by the best judges. In order to promote the production of fine wools, the Cape of Good Hope Agricultural Society had resolved that a cup, of the value of 50*l*, should be given to the proprietors of sheep who produced the finest sample of wool from sheep lambled in the Colony. A second cup was to be given for the second best sample of wool, the quantity of wool sent in was not to be less than 100*lb*. The information received by mercantile firms relative to the state of the flocks in New South Wales represent that, at the latest date, the heavy rains had been fatal in some places to the young lambs. In Bathurst, however, the flocks were in a healthy state. The value of stock in the colony was increasing rapidly. A large sale of improved flocks by sheep had taken place and averaged 2*l* 10*s* 4*d* per sheep, rams selling at 3*l* 4*s* each. About 2000 sheep had been sold of mixed breeds, at an average of 1*l* 2*s* 6*d* each. Some of the flock masters in the Colony were realizing from 2,000*l* to 5,000*l* a year from the produce of their sheep. In Van Diemen's Land, the flocks were going on favourably. Contracts had been made to deliver the wool of this year's clip at Hobart Town in the present month, at 15½*d* per *lb*. There had been many robberies committed of sheep in the Colony.

LEECHES LIVING ON TREES.—One of the greatest curiosities with which the woods of the Island of Luçon (near Manilla) offers, says the writer of "Meyen's Voyage round the World," quoted in Richter's *Foreign Quarterly Review*, is the leech which we meet with in the region of the arborescent ferns. It forms a new species which we call *sanguisuga tagalla*, smaller than our official leech, broad, of a yellowish brown colour, and the upper part marked with small irregular spots, and a black stripe running lengthwise down the back. This leech is blood-thirsty, but its bite leaves very small marks, on which account it would be much preferred in Europe to those now in use. Before we had observed them they got into our boots and began biting us: we felt the pain, but thought we had been bitten by ants, till at last our boots being filled with blood our attention was aroused. We brought home two of them in spirits of wine. However fabulous this account of leeches living on trees may appear,

it is nevertheless correct; and we must learn to believe that there are leeches which can live in damp air, just as well as that *confervæ* may be generated in a moist atmosphere, a circumstance which the celebrated Swedish writer on *Algæ* could not comprehend, and was uncourteous enough to declare to be a falsehood."

### BRECONSHIRE AGRICULTURAL SOCIETY.

At a Meeting of the Subscribers held at Brecon, on Friday, the 24th April, the Premiums awarded at the last Autumn Show, were paid, and the following prizes were awarded:—To Mr. Thomas Watkins, of Fforddvaur, the Society premium for the best field of turnips in the county; also the silver cup, presented by Lloyd Vaughan Watkins, Esq., of Pennoyre, for the best field of Swedish turnips in the county; and also the silver cup presented by Major Gwynne Holford, of Buckland, for the best field of Swedish turnips within the hundreds of Penkelly and Talgarth; to Mr. John Williams, of Abercynrig, the silver cup presented by Major Gwynne Holford, for the best field of common turnips in the county; to Mr. Wm. Powell, of Pantycorred, the silver cup presented by Lloyd V. Watkins, Esq., for the best field of common turnips in the hundreds of Merthyr and Devynnock.—At three o'clock, a large party sat down to a most excellent dinner, at the Swan Inn, John P. Wilkins, Esq. (in the unavoidable absence of the Member for Radnorshire) in the chair. After dinner, a Silver Tankard, purchased by subscription, was presented by the Chairman to Mr. Robert Bright, butcher, Brecon. It is extremely splendid, and has on it the following inscription:—"To Mr. Robert Bright, butcher, this Tankard is presented, as a token of respect for his spirited and upright conduct in business, by the Agriculturists and Tradesmen of Breconshire."—In the evening, a subscription was entered into to continue the ploughing match. It will take place at the Autumn Show, and it is intended that the successful ploughmen should be rewarded in the same manner as last year, viz.—the best, a coat, waistcoat, and breeches, with the Society's buttons, which are very handsome, having upon them a plough, and the words "Breconshire Agricultural Society;" to the second, a coat and waistcoat, with the Society's buttons; and to the third, a coat, with similar buttons. And for the purpose of stimulating young men to the proper management of the plough, it was suggested that a suit of clothes, with the Society's buttons, should be given to the best ploughmen under eighteen years of age.—In addition to the usual premiums by the Society in respect to live stock, &c. &c., the following Silver Cups have been kindly offered for the year 1835:—Lloyd Vaughan Watkins, Esq., a silver cup for the best crop of Swedish turnips, not less than six acres, cultivated in the county of Brecknock; also a silver cup for the best crop of common turnips, not less than six acres, within the hundreds of Merthyr and Devynnock; Major Gwynne Holford, a silver cup for the best pen of three years old mountain wethers, not less than ten in number; likewise a silver cup for the best three years old cart colt or filly, to be shewn at the Autumn Meeting; Joseph Bailey, Esq., M.P., a silver cup for the best cart stallion, to cover within twenty miles of the town of Brecon, in 1835; W. R. Stretton, Esq., a silver cup for the best thoroughbred stallion, kept solely to cover in Brecknockshire.

### POPULAR EDUCATION.—AGRICULTURAL SCHOOLS.

It will doubtlessly be conceded that the rural population of this country is both morally and physically in an extremely destitute and degraded condition. If proof of this be required, none more convincing can be afforded than the general absence of the spirit of enterprise, by which the rural districts are characterised.

The evil is to be traced to previous moral neglect. Much, indeed, has been done in the way of instruction; but in too many instances by ill-directed, uncertain, and fluctuating efforts. The main question, however, is, whether the general mode or system of education, hitherto adopted in this country, has proved practically correct. It is believed that the testimony of experience will decide this in the negative.

The main feature of all education should be its adaptation to the class for which it is provided: a principle which appears to be strictly observed with respect to all classes excepting that which, from its dependent situation, is more immediately thrown on the benevolence of the public. Destined to fill a station in life most important to the general well-being of the community—the working classes have the fewest facilities of preparation afforded them. The necessary result is not only that the son follows the profession of the father, but, that his limited knowledge fixes him to the identical branch of that profession; nor does he ever dream of the possibility of earning a livelihood, or of improving his condition by his own exertions, in another line.

To compel, or at least propel, this exertion, appears the main object of the existing Poor Law. An object, at once, just in principle, and certain, in the event, of proving practically beneficial. But, at the same time, no man of sense or feeling can deny the necessity of adopting some auxiliary and preparatory measures.

Among others which might be proposed, none appear to be of such pressing importance as that of Industrial Education. It is not a new and untried system, but from its local success, as well as from the acknowledged correctness of the principle on which it is founded, it has, at the present moment, a peculiar claim to universal adoption and support.

Agricultural schools, and what are generally known as schools of industry, conducted on the Hofwyl system, in which the scholars are instructed in various branches of manual labour, would supply the radical defects of the present mode of popular education, by enlarging the knowledge and capacities of the poor; and by bringing their intellectual and physical energies into active exercise, prepare and fit them for the grand object of obtaining an honest, independent, and comfortable subsistence.

These schools, with good masters, and a sufficient quantity of land attached, might be so contrived as to merit, to a certain extent, the designation of self-supporting. It has been proved that the scholars enter into the plan of manual labour with infinite pleasure, and will work for their education. The value of the produce will, of course, vary considerably, according to the nature of the soil, and the facilities of sale; so that the probable amount of clear profit per acre cannot be accurately ascertained. But from the reports which have been received from various land allotments, it may be calculated as likely, under every disadvantage, considerably to exceed 6l.

Six acres of land, attached to a school, would, therefore, be an important assistance towards defray-

ing the expenses of education. Any number of boys, not less than 25, of the age of nine years and upwards, would be sufficient to cultivate the soil; and these receiving their education for their labour, would unite, at the same time, healthy recreation with the most useful and pleasing employment: whilst the annual expense of their instruction would be so considerably reduced, as to render the system available in many situations where the support of a school would be otherwise difficult, if not impossible.

In every institution of this kind, however, a considerable outlay would be required, in the first instance, in erecting a school-room and adjoining cottage for the masters; though it is probable that a sum of 400*l.* might prove sufficient for each rural parish of moderate extent. Some persons may start, even at that sum, but the just view in which the matter should be considered, is, whether a parish would not, in a single year, derive benefit to the extent of the amount expended.

The object of these remarks is to rouse the public attention to a due consideration of the subject at a period when it is proposed to make a national provision for the education of the lower orders. It seems reasonable to suppose that such a provision would be best applied in furtherance of the acquisition of habits of enterprise and industry, which are the chief means of wealth and happiness. And if one-third, or one-fourth, only, of the first cost of the erection of suitable buildings were provided by the government, such a stimulus might be given to local exertion as would soon suffice to supply every rural parish in the kingdom with the means of useful instruction. The stimulus thus afforded would soon give rise to more extended measures. In a few years, well-instructed teachers could easily be obtained; and, as the facilities of education were multiplied, the peasantry would become more and more anxious to avail themselves of its advantages.

It is therefore proposed—1st, To establish a school by voluntary contribution, in some rural district, with six or seven acres of land attached, for the purpose of making the experiment how far such an institution may be made to support itself,—and, 2nd, to petition the Legislature to make some provision for the cost of such establishment, in the building of a school-room and the purchase of land.

The friends of education are earnestly requested to unite their efforts to assist in carrying the proposed plan into effect; and especially, by their petitions to the Legislature to prove the strong and general feeling which exists on the subject.—*Bucks Gazette.*

### LEWES HORSE FAIR.

This fair took place on Tuesday, May 5th, on the slope of the hill leading to the Race Course;—it was numerously attended; but we regret to state that the show was exceedingly limited, and the horses and colts, if not of an inferior description, had any thing but a showy appearance—a circumstance attributed by many to the time of year, when the farmers are not able to keep their horses high enough. We hope more attention will be paid to the breed of horses for the next fair. Further particulars will be found in the proceedings that took place at

#### THE DINNER.

At three o'clock about eighty gentlemen and

yeomen sat down to an excellent dinner at the Star Inn, provided by nine hostess at a very moderate rate. J. Ellman, Esq. (of Glynde) was in the chair, and — Molyneux, Esq. was the vice-president. Among the company were C. Craven, G. Darby, T. W. Scutt, J. Thomas, — Tourle, — Ingram, Esqrs., Captain Richardson, Captain Willard, &c.

After the removal of the cloth the healths of "The King" and "The Queen and the Royal Family" were drank with great applause.

The CHAIRMAN then said that although they had just drank the health of the Queen and Royal Family, he should beg to propose the health of the "Princess Victoria and the Duchess of Kent," and he hoped that they should have the honour of receiving them again at the next East Sussex Hunt Races. (*Cheers.*)

The healths of the "Earl of Egremont" and the "Duke of Richmond" were then drank, and received with the warmest applause.

The CHAIRMAN had now the honour to propose the health of a gentleman whom he considered almost entirely the founder of the Show,—the health of "Thomas Ingram, Esq., and success to the Colt Show and Horse Fair. (*Loud applause.*)

Mr. INGRAM returned thanks. He did not assume much credit to himself, as he had merely taken a leaf out of the Earl of Egremont's book; and as long as gentlemen supported him, he would never relax his exertions to establish this Show. It was an excellent thing, and ought not to be given up. Gentlemen entertained different opinions upon the subject, and some desired to alter the time of the Show; but these are things said out of doors, whereas it ought to be arranged at a meeting, and then business might be done. He repeated that he never would leave them while he had the support of the gentlemen and yeomen whom he saw around him. (*Cheers.*)

The CHAIRMAN then said, as they had drank success to the Show, and it was now his turn to retire as steward, he should have the honour of nominating a successor. It so happened that when the Show was held in August, the gentleman he was about to propose could not attend. He was one, whose suavity of manners and high respectability had converted what might be termed a hostile country into one of friendship and unity. He had only to name Mr. Craven. (*Loud cheers.*)

Mr. CRAVEN felt very much obliged for the compliment paid to him. It had not been convenient to him to attend the previous show, as he always selected August for his holidays; otherwise, he would have had great pleasure in attending the meeting. He was most happy to have it in his power to attend now, as it gave him an opportunity of expressing his extreme pleasure at meeting so respectable a company, whose friendship and good will he valued and esteemed. He came from London last night to attend this show, and he hoped it would go on and flourish. Independently of his advocating the promotion of the breed of horses, his inducement was to establish a spring race. If farmers could not get 10*l.* a load for their wheat, he conceived that it would pay them better to breed colts. (*Cheers.*) This show was also calculated to bring together landlord and tenant, the aristocracy and the yeomanry. (*Cheers.*) If he had been a humble instrument in effecting this object in the county of Sussex, he was rewarded by the expressions of kindness which had been shown to him. He hoped and trusted that this institution would ever thrive; and

he now begged to drink "Success to Agriculture." (*Cheers.*)

The VICE-PRESIDENT said that the worthy chairman having nominated one steward, it was now his duty to nominate another. He had much pleasure in proposing a gentleman to that office, who was a great friend to the landed interest and to the farmer,—the Hon. Gen. Trevor. (*Cheers.*)

Mr. COLEGATE (steward of Gen. Trevor) said that the General was absent, but that he had no doubt that he would accept the office with great pleasure.

The CHAIRMAN, in introducing the healths of their two former stewards, J. Thomas, Esq., and Captain Richardson, said he was obliged to the gentlemen who attended here this day, for he quite agreed with Mr. Craven, that an union of the aristocracy and the middle classes was most essential now. These were not times to keep aloof. (*Cheers.*)

Mr. THOMAS, in returning thanks, said he had accepted the office willingly; first, from respect to Mr. Ingram and those gentlemen who immediately followed up the benificial and meritorious plan which he suggested; secondly, from the feeling of interest he individually entertained for the institution itself; and, thirdly, for the reason suggested on his left, that every landowner would best promote the interest of agriculture, by associating with the different ranks of society connected therewith. (*Loud cheers.*) He wished it was in his power to congratulate them this day, as he was able to do last year, on the successful progress of this Society. He was sorry to say the reverse was the case; for, instead of proceeding as did the first year, they were retrograding. But let them look at the cause of this retrogression. They must recollect that they took a strong course last year upon what was considered the best advice,—he alluded to the change of time in holding the meeting from August to May. Now, as the committee met frequently, it would be for that committee to consider whether it would not be right to retrace their steps; and hold the meetings again in August, making such alterations as might be thought advisable. (*Cheers.*)

Captain RICHARDSON thanked the meeting for honour they had done him, and said he should follow his friend, Mr. Thomas, in expressing his sorrow that they had not a better show. He should propose that the matter should be referred to a Committee.

Mr. THOMAS thought that a meeting would be more advisable, at which all the subscribers should be requested to attend.

Captain RICHARDSON hoped they would have a full meeting, and that they would bear in mind what they had been told by their dealers,—that the hunters and coach-horses should be shown at an age fit for sale: the show, he had no doubt, would then be attended by London dealers.

Mr. LENEY was satisfied that the autumn was the best time for the show, when horses are in good condition. Most people looked to a fat horse; and at this time of the year the horses were not kept high enough to show. Judges were frequently deceived in the quality of a horse in lean condition.

After considerable discussion as to the day on which it would be advisable to hold the meeting, it was ultimately agreed to hold it on the 16th of June, and in the mean time to issue advertisements.

The CHAIRMAN then made a statement of the finances, from which it appeared that the Society

had a disposable balance of 33*l.* 2*s.* 6*d.* Under these circumstances they had no occasion to despair.

The Chairman, before he proceeded to read the awards of the Judges, took occasion to state that every one must feel the office of Judge to be by no means an agreeable one, as it was impossible to please every body; but he was sure that the Judges had given satisfaction, as was proved by the fact of their having filled the office two successive years. He begged to propose the health of the Judges, Messrs. Chatfield, Putland, and Turner.

Mr. PUTLAND, in returning thanks, said he was sorry that the Judges had not more to do to-day; they had decided to the best of their judgment, and hoped they had given satisfaction.

Mr. TOURLE, jun., proposed the health of Mr. Shackell, who had passed judgment upon the hunters and carriage-horses.

The CHAIRMAN said that a great deal of the interest attached to the rewards he held in his hand was unfortunately gone, in consequence of the successful candidates having been made known in the field. It was desirable that they should be kept perfectly secret till after the dinner, in order to ensure a good attendance, (*hear, hear,*) and he requested those who were appointed Judges for the ensuing year not to divulge the successful competitors in the field.

Mr. ELLMAN then proceeded to read the award of the Judges, and to those successful competitors who were present he delivered the premiums.

To the owner of the best cart gelding or filly, two years old, £15.—Mr. Lewis, of Ringmer.

The CHAIRMAN said it was scarcely necessary to observe that the system of numbering the horses was adopted, in order that the public might not know to whom they belonged. He hoped that Mr. Lewis was present to receive the prize, but being told that he was not, he said he thought he ought to forfeit it (*cheers.*) At all events, it would have been better taste to be present; and he should propose that the award be detained till the ensuing meeting, when Mr. Lewis be requested to attend. (*Cheers.*)

This proposition was agreed to.

£15. to the owner of the best black filly, bred by himself, was awarded to John Ellman, Esq., of Glynde.

£5. to the owner of the second best cart gelding or filly, two years old.—To Mr. Woodman, of Falmer.

To the owner of the best cart stallion, £10.—To Mr. Hugh Simmons, for his chestnut stallion "Rodney."

The CHAIRMAN stated that this premium would not be given till it was ascertained that the stallion had covered a certain number of mares. The Chairman had had mares covered by this stallion, but they had not proved in foal; he had heard, however, that others had been more successful with the same horse: and he should, therefore, waive that consideration.

The CHAIRMAN said he felt unwilling to mention the fact that the Judges did not consider any stallion shown them to-day, bred in Sussex, worthy of the other premium.

Hugh Simmons, the owner of Rodney, was then called up to hear the award of the Judges; and the Chairman having stated to him that he doubtless knew the rules, Mr. Craven presented Simmons with a glass of wine.

SIMMONS drank the healths of the gentlemen present, and wished that every gentleman who

employed Rodney might have good luck. (*Applause and laughter.*)

£15. to the owner of the best gelding or filly, four years old, fit for a hunter or roadster.—To Mr. Chas. Goring, of Newick.

£15. to the owner of the best gelding or filly, fit for a carriage horse.—To Thomas Richardson, Esq.

The CHAIRMAN then gave "Liberal landlords and honest tenants." (*Cheers.*)

The CHAIRMAN begged, as some gentlemen were about to retire, to propose one more toast, and as he attached very great importance to and advocated the great principle of landlords associating with their tenants, he gave "May every industrious labourer meet with a kind and indulgent master." (*Cheers.*)

The VICE-PRESIDENT then proposed the health of "The Committee of the Show." (*Applause.*)

Mr. INGRAM, on behalf of the Committee, returned thanks. He always felt interest in the prosperity of the show. After a few remarks, he proposed the health of their excellent Chairman. (*Cheers.*) Drank with three times three.

The CHAIRMAN said that, as far as he was concerned, the trouble had been taken off his hands by the exertions of Mr. Tourle, jun. After drinking the Vice-President's health, he had no doubt that Mr. Tourle's health would be drank with pleasure. (*Applause.*)

The VICE-PRESIDENT said if he possessed the eloquence of Mr. Ellman, he should be induced to make a lengthened speech; but, as it was, he should merely observe that he hoped a close union would take place between landlord and tenant.

Mr. TOURLE's health having been drank, that gentleman expressed great disappointment at the wretched show of horses on that occasion. He was perfectly at a loss to account for it. It was true that Mr. Leney had given a reason; but other gentlemen with whom he had conversed, told a very different story. He was persuaded that if the time was altered to August, cart colts would be shown, and nothing else; and from enquiries he had made among some eminent London dealers, he was confirmed in this opinion. When the hunting season commenced in September, he rode a carriage-horse, and sold it for a gentleman for 60*l*. A dealer said "Show that horse in the spring, and he will fetch 10*l*. or 15*l*. more." A horse four years old could at that time hardly be purchased in Yorkshire and the great horse districts. If they had the show at all, it should not, he thought, be later than May. It appeared that there was no want of money to induce persons to show:—to what, then, must the failure be attributed, but negligence in the breed of horses? The only inducement was to offer such premiums as would hold out benefit to the farmers; and if that availed nothing, he did not know what could be done. (*Cheers.*)

Mr. RICHARDS gave "The memory of the late Mr. Ellman."

The VICE-PRESIDENT then gave the health of Mr. Darby. (*Loud cheers.*)

Mr. DARBY, in allusion to some words that had fallen from the Vice-President respecting his (Mr. D.'s) experience in farming, was quite sure that he had received no profit from wheat, and he was obliged to console himself with being able to grow a few hops. The condition of the farmer was as bad as it could be. He should be most happy to come from town to attend the next meeting. He hoped it would not be given up; if there was only one subscriber remaining, he was ready to be the second; and if there were no horses, he should be

for having a dinner. (*Laughter.*) It ought not to be given up for one bad show. He knew cattle shows at the lowest ebb, which by perseverance had rallied, and were now going on well. He was sorry that he had not been able to bring a horse; but he intended to bring one next time. If the subscriptions were carried on with spirit, they must inevitably bring good horses.

Mr. TOURLE said it had been stated that Sussex could not breed good horses; but he would mention the names of some excellent horses, which would completely refute the assertion. Mr. T. then mentioned Waxy, Priam, and Camel. The latter, which belonged to the Earl of Egremont, was now covering at 20 sovereigns a mare. Did not this prove that the county of Sussex could produce good horses? If from thorough-bred horses they came down to hunters, he would mention his friend Mr. Thompson's horse, which was successful at the East Sussex Hunt Races; although a great deal had been said against him, Mr. Thompson was bid 150 guineas for the horse the other day. (*Hear, hear.*)

Mr. DARBY then proposed the health of the "Earl of Chichester." (*Applause.*)

The "Secretary's" health was then drank.

Mr. DARBY then proposed the health of "Mr. Craven, as master of the East Sussex Fox Hounds."

Mr. CRAVEN felt flattered at the unanimous expression of favour towards the East Sussex fox hounds. He was called upon to promote their amusement;—it was not voluntary on his part, for he assured them that it was no sinecure. (*Hear, hear.*) He was called upon eight years ago, in this very room, by Major Cater, to prevent the East Sussex fox-hounds from going to Tattersall's. He came a stranger into the county of Sussex, possessing no property in the county, nor any influence whatever, when he was called upon—he did not know why—to manage these hounds. He undertook to do it; and if the support and unanimous expression of thanks which he had received showed that he had succeeded, his reward was their approbation. The pleasure and pride of his life were to mix with the yeomen; for he did not like the exclusive system. (*Cheers.*) They must be aware that his temper was often tried, and grievously tried (*hear, and laughter*); but all the time he met with their support and approbation he should continue his exertions to procure them a good gallop. (*Hear.*) When he looked around him, and saw so many of the yeomanry, whose good opinion he valued beyond every thing upon earth, he hoped that his conduct would always merit the esteem which they had so liberally expressed. (*Loud cheers.*)

Mr. THOMPSON proposed the health of "Lord Gage and the various landed proprietors who were absent from the meeting."

Mr. CRAVEN stated that Lord Gage was in town. He dined with him on Sunday, and he knew that his lordship would have been here, if he had been in the county.

Mr. DARBY could not forbear alluding to a subject which nearly interested all the gentlemen in the Eastern district, and in fact every person in this county; he meant the diabolical acts of some malicious persons who had destroyed so many sheep. Mrs. Dray, of Alfriston, had been a great sufferer from the destruction of live stock. He feared that things were come to a bad state, for on Sunday night his friend, Mr. Ellman, of Glynde, had had some sheep destroyed. Within his own district he had said to the labourers that although he was willing to better their condition, and would

resort to the best means to do it, still if those horrible practices of destroying sheep and other property were resorted to, he would do his utmost to bring the offenders to justice; but how that was to be done, it was difficult to say. If means could be adopted by a subscription to prevent such a wicked destruction of property, he should be happy to put down his name at once for 5*l*. In his own neighbourhood he did not apprehend any outrages of this description; but it was the duty of every man to endeavour to put down such a horrible practice. He ought perhaps to apologize for introducing this subject, but he thought that no time should be lost in suppressing, if possible, these crimes.

Mr. PUTLAND agreed in the propriety of raising a subscription, and stated that he had just seen an influential gentleman who was of the same opinion, and who was about to enter into a subscription. He hoped the noblemen and gentlemen of the county would support it.

Mr. ELLMAN was very much obliged to Mr. Darby for mentioning the subject, and the only reason why he had not named it himself was that he did not wish to do anything to mar the conviviality of this meeting. He had done his utmost to conciliate the labourers in his parish; they were all employed; and he did not believe that he had injured any man in the parish. The Union had done him the honour to elect him as Chairman, to which alone he attributed the destruction of his property. He believed, however, that this feeling had its origin in some distant quarter, where the idle and dissolute urged others to acts of outrage. A public reward should be offered to bring the offenders to justice; the reward should be ample.

Mr. DARBY said he was also Chairman to the Guardians. He had set his face against the Poor Law Bill before it passed into a law; but since it became the law of the land, he had endeavoured to carry it out in the best manner he could. As far as the Union was concerned, he had told the poor that everything should be done to consult their comforts, but the idle and bad must expect to be punished. The poor were acting foolishly, and driving the Guardians to do that which, otherwise, they were not at all disposed to do. Mr. Darby then said he was inclined to enter into subscriptions forthwith, but this was objected to; and it was agreed to hold a meeting on the following day.

A gentleman here observed that Mrs. Dray's son had been called to fill the office, and having shown a bold front, this had no doubt occasioned the destruction of Mrs. Dray's sheep.

## THE RELIEF OF AGRICULTURE.

(FROM THE BRIGHTON GUARDIAN.)

Before the Parliament adjourned for the Easter holidays, which it did on April 20th, the Marquess of CHANDOS gave notice that he would on May 18th bring the distress of the agriculturists under the notice of the House of Commons. But the agriculturists, as well as all other classes, must now be convinced from long experience that nothing is ever to be got from the legislature as long as the people themselves are indifferent. To make the House of Commons listen to the complaints of the farmers, the farmers must remonstrate earnestly and determinedly with the House of Commons. By resisting the law, the Irish have put an end to tithes; by numerous meetings and

petitions, the inhabitants of towns got the house tax removed and the shop window tax reduced. The Dissenters by their own exertions procured the repeal of the Test Act; and the Catholic Association compelled the legislature to pass the measure for Catholic Emancipation. The strenuous demands of all classes at the close of the war forced the unwilling ministers to abolish the property tax. At all times and in all countries the legislature has only conceded what is just and right to the wishes of the people when the people have shewn themselves determined to have it. The maxim is universally true which is expressed in the lines

Hereditary bondsmen, know ye not,

Who would be free, himself must strike the blow.

In plain and humble prose we have told our readers over and over again that they must help themselves; and we can now tell the farmers that the time is come, when they must help themselves or be content to die like beggars in a ditch.

The agriculturists, we are afraid, do not regard us as their staunch friends because we have always spoken against their favorite Corn law. They ought however now to be convinced that this law is of no benefit to them. In fact it serves no other purpose than to make them expect higher prices than they can realise, and to promise in consequence higher rents than they can properly pay; and as the result, the corn law makes them ruin themselves for the benefit of the tithe and land owners. Another purpose this law does indeed serve, and a very injurious purpose it is. The corn law makes the inhabitants of towns look upon the agriculturists as opposed to them; and they now regard the deep distress and decay of their bread-growers not only with indifference, but in many cases with exultation. This is for us very sorrowful. It is as if brothers were to quarrel and fight, instead of mutually assisting and aiding each other. That we have always been opposed to this law,—not from aversion to the farmers, for we prize them highly,—but from a deep conviction that it is quite as injurious to them as to any other portion of the community,—should now recommend our observations to favour, for their present condition must prove to them that this law is no friend to them. Supposing therefore that present circumstances may give weight to our words, we once more address ourselves particularly to our agricultural readers, and call upon them to embrace the opportunity to be supplied by the motion of the Marquis of CHANDOS of forcing their interests upon the attention of the legislature and of strengthening his hands. They must meet and they must petition Parliament. Between this and May 18th there is plenty of time; and if they exert themselves, they may yet be saved from the ruin which threatens to engulf them.

## THE NECESSITY OF PETITIONING.

They cannot want for causes of complaint. By a reference to our last week's journal, they will see that the price of wheat in the London markets varied between 33*s* and 48*s*, or was on an average 40*s* 6*d* per quarter. Now no agriculturist that we have ever met has admitted the possibility of growing wheat under the present burdens for less than 50*s* per quarter. None of the skilful men who have at several times given evidence before agricultural committees of the House of Commons have stated it so low. In general, their estimate of a remunerating price varied between 56*s* and 65*s*; but if we suppose that some little subsequent reduction of taxation and fall in the price of the articles which the farmer has to buy have some-

what reduced his necessary expenses, we cannot possibly suppose that he can grow wheat for less than 50s the quarter. But he receives only 40s; and it cannot be expected that he should both labour to feed the rest of the people and pay 10s per quarter for the privilege of labouring.

In a pamphlet recently published by Lord WESTERN, who, though a Whig and a reformer, and therefore turned out of the representation of Essex by the influence of the parsons and by the neglect of the ungrateful farmers, has ever shown himself a steady friend to the agriculturists, this statement is made.

I suppose a farm of one hundred acres of fair, good arable land, well cultivated upon the four-course system, the produce of wheat at  $3\frac{1}{2}$  qrs per acre, barley 5 qrs, beans and peas  $3\frac{1}{2}$  qrs. Wheat during near a quarter of a century, from 1797 to 1819, had averaged 80s the quarter; 15 years preceding 1819, 85s: the rent founded upon these data, I take at 35s. per acre; the moment the Bill passed, the markets fell 30 or 40 per cent., and in the 15 years succeeding, the average price, as near as may be 55s.; it has subsequently fallen still lower, and is, I believe, now only 40s. I therefore consider the price of wheat to have fallen, on the average, 30s per quarter; barley, 20s.; beans and peas, 20s. Upon these grounds I estimate the reduction of the money receipts of the farmer upon 100 acres to amount annually to 325*l*. The reduction of price upon clover, tares, and turnips, is loosely estimated, but moderate. I take no notice of the change of price of various minor articles, the produce of such a farm. This aggregate and enormous difference in his return, I think, I clearly establish upon the following calculation: *I take the produce on the four-course system to be as under:—*

|                 | Acres.                                                                        | Qrs.                    | Diminution.           |
|-----------------|-------------------------------------------------------------------------------|-------------------------|-----------------------|
| Wheat           | . 25                                                                          | $3\frac{1}{2}$ per acre | —30s per qr. £131 15s |
| Barley          | . 25                                                                          | 5 ditto                 | —20s ditto . 125 0s   |
| Beans & Peas    | $\left. \begin{array}{l} 12\frac{1}{2} \\ 12\frac{1}{2} \end{array} \right\}$ | $3\frac{1}{2}$ ditto    | —20s ditto . 42 0s    |
| Clover          | . 12 $\frac{1}{2}$                                                            | —                       | . 15 0s               |
| Turnips & Tares | $\left. \begin{array}{l} 12\frac{1}{2} \\ 12\frac{1}{2} \end{array} \right\}$ | —                       | . 12 0s               |
| And Fal- low    | . 12 $\frac{1}{2}$                                                            |                         |                       |

Acres 100.

£325 15s

The extraordinary change here exhibited, and I may say proved, surely calls for the most serious consideration of those who direct the Councils of the Kingdom. It will hardly be now denied that this change, which was, at all events, coincident as to time to a moment with the passing of the Currency Act, was caused by that measure. If this is not to be altered, our Statesmen should, at all events, show the means of restoring the financial equilibrium of the country so rudely shaken. First, what reductions are necessary to the farmer? I will touch upon rent,—to begin:—

If the landlord reduces 15s. per acre, or, in other words, reduces his rent from 175*l*. to 100*l*., the tenant has 75*l*. to set against 325*l*.; if the landlord sinks his rent 20s. the acre, and instead of a rent of 175*l*. puts up with a rent of 75*l*., the tenant has 100*l*. to set against 325*l*. I will not stop to comment upon the situation of the landlord under such circumstances—it must be too obvious to need any observations. I will go on to suppose the entire rent done away: the tenant will still be under the necessity, singular as it must appear, to reduce his expenditure in other ways to the amount of 150*l*., to make up, with the rent 175*l*., the

loss of 325*l*., to put himself upon the footing on which he stood prior to the year 1819.

Now making a considerable allowance as we must, for the higher price which up to 1819 the farmer had to pay, and which ought to be deducted from the sum he received for his crop before 1819, enough remains to show that no possible reduction of rent can save him from ruin. In fact, it is well known that many of the small freeholders in this and the neighbouring county who have no rent to pay find it difficult, if not to say impossible, notwithstanding the utmost parsimony, to make both ends meet. They can but barely subsist in the most frugal manner; but as to saving any thing, that is hopelessly impossible. We quite agree therefore with Lord WESTERN when he says—

The circumstances of this particular moment do with unprecedented force call upon the landed interest to instruct Government as to their actual situation,—they ought to explain to Government that such is the state of the corn and meat markets, that no landlord, whose lands were let at any thing like a fair value twenty years ago, can look to more than *half* the amount of the rent that was then *cheerfully* paid; and the tenant so relieved of *half* the rent is comparatively, *after* such reduction, in a very poor, instead of a flourishing state; that at the former period he could employ his men and could hardly find hands enough—that *now* he cannot make up his Saturday night's payments if he engages the same complement with any tolerable wages.

Upon this ground we tell the farmers of Sussex that they ought now to pour in petitions on the Parliament, to aid the Marquis of CHANDOS. They ought to state their case openly and clearly, and they ought to instruct every representative they can influence to support the prayer of their petitions on pain of forfeiting their confidence for ever.

#### CAUSES OF THE PRESENT CONDITION OF THE AGRICULTURISTS.

There can be no doubt of the distress of the agriculturists; nor is there, as we believe, any doubt as to its causes. The various expenses to which they are necessarily liable, such an interest on all the capital sunk in their land or employed in erecting buildings on its surface,—and it is of no consequence to our view that the farmer owns all this capital, for in that case he ought to get interest for it and does not,—taxes, tithes, rates, and fixed burdens of all kinds, together with the wages of labour, are not replaced by the price at which he can dispose of his crop. The expense has not diminished in proportion to the fall of price, and the farmer cannot sell his crop for what it costs him.

The causes of the fall of price are twofold,—the change in the Currency and the free importation from almost untaxed and untithed Ireland, which possesses an amazingly fertile soil, many millions of acres being now for the first time only cultivated with any thing approximating to skill. From whatever causes however the discrepancy between the farmer's expenses and the price at which he can sell his crops arises, it is quite impossible it can continue. He cannot continue to sell his produce at a loss without first ruin to himself, and afterwards starvation to the people. The latter, however, will be checked by importation from other countries long before the price rises so high as to repay the farmer for all his losses and encourage him again to till the ground. Remotely the whole nation will be prodigiously injured by this state of things, could it continue; but the prodigious injury will be mainly effected through the ruin in the first

instance of the cultivators of the soil. The national evils, though contingent and remote, are certain; the present injury to the farmers is tremendous: the remedy or the means of preventing complete ruin is however by no means evident. We confess that in recommending the agriculturists to complain of distress and to worry the legislature with petitions, we are almost at a loss to say, except as to one point, what they ought to ask as a means of relief.

#### PROPOSED REMEDIES.

The two causes of the fall of prices are the free importation from almost untaxed and untithed Ireland, and the alteration of the Currency; and in our opinion the farmer can look for no effectual relief from any change in either of these. It is clearly impossible to impose taxes and tithes on Ireland at all equal to those paid in England. The present tithes are to be given up in Ireland because they cannot be levied. Neither can the produce of Ireland be prevented from coming freely into England. It is as much a part of the empire as Kent; and we might as well seek to establish custom houses and prohibit a free trade between Kent and Norfolk as between Limerick and Lancashire. There are sources enough to dispute between the two countries without adding commercial restrictions; and if we wish to dismember the empire and bring about that Repeal of the Union, the talk of accomplishing which is considered a great crime in Mr. O'CONNELL, we shall prohibit the free importation of corn and other provisions from Ireland. Such a prohibition would at the same time strike a blow at our commercial prosperity never to be recovered. Thus it is impossible either to subject Ireland to rates, taxes, and tithes equal to those borne by England, impossible to prohibit the corn grown there under the most favourable and the cheapest circumstances from coming freely into our markets, and impossible therefore to give our agriculturists relief by any change to be wrought by the legislature in the condition of Ireland.

Lord WESTERN and his friends expect that great relief would be obtained by a change in the Currency. Our opinion is directly the reverse. If our readers have done us the honour to remember our opinions, they will know that we have no partiality for the gold standard, that we have no aversion to country bank notes however small, that we do not advocate the monopoly of the Bank of England, and that we are for a perfectly free trade in money; yet we must say that we do not believe that any alteration of the standard of value or any permission to issue small country bank notes would be of any advantage to the farmer. The only advantage which we can possibly conceive that he would derive from any alteration whatever would be a small one of betwixt four and five per cent., or not more than 2s. in the price of a quarter of wheat, by substituting silver for gold, or allowing the community to use both indiscriminately in their payments as they pleased. Paper, whether issued by the Bank of England or country bankers, cannot possibly again circulate in this country unless payable in the precious metals on demand. To issue it, therefore, in any quantity can never lower the value of the currency for more than very short periods below the value of silver, the cheapest precious metal. The difference between that and the present currency is between four or five per cent.; and to that extent, and no more, would the most unlimited issue of paper, unless it were paper not payable on demand, which is a lie and a fraud, debase the currency. Connected as Great Britain is with all the commercial countries of the world, being

in fact the great heart of trade, her currency must be very nearly on a level with that of surrounding nations; and the circulation of money, which is the life-blood of trade, cannot be impeded in the heart without throwing the whole system into ruinous convulsions. But if our currency must remain, as long as we are at peace with them, nearly on a level with that of other nations, and as all nations use gold or silver for currency, no issue of paper could raise prices beyond the substitution of silver for gold, or could be of advantage to the farmer beyond, as already stated, four or five per cent.

Those who, like Lord WESTERN, reason differently, seem to us to mistake the cause of the phenomena which so forcibly arrest their attention. Although it must be admitted that the various Acts of 1819, 1822, 1823, and 1826 have done a great deal to perplex and confuse the consideration of this subject, yet it is clear that the return to a metallic currency was imperatively necessary; and the necessity was caused by the circumstance we have just alluded to, of our country being, as it were, the heart of the great social and universal system of trade. It was not only England that felt this necessity, all the nations of the world connected in any manner with the general system of trade have found it necessary to re-establish the metallic standard. We have formerly in this journal endeavoured to explain in what manner, because all bargains are made according to the money prices of different countries, the adoption here of a more valuable standard in gold than in other countries where silver is the standard has given them an advantage in our markets, and has consequently made them buy largely in our market, extending our trade, though making it little profitable, if not profitless. The adoption of a valuable standard less than that which is in use in other countries would have the reverse effect. It would give us an advantage, it would increase our profits as far as we could sell, but it would drive foreigners from our markets. Open as all the markets of the world now are to competition, and succeeding as most of the countries of the Continent do in manufactures almost as well as Great Britain, we have not the smallest doubt that to have preserved our debased standard such as it existed before 1819, or now to return to it, would infallibly ruin the trade of the country, cause its population to become stationary or decay, and more effectually ruin agriculture, at no distant period, than even the present system. What could be borne when Great Britain had, as during the war, a monopoly of the trade of the world, would infallibly ruin her when all the markets of the world are open to competition; and the debased paper currency which under that monopoly did not quite bring about our destruction, would irremediably accomplish it now.

There is another most important consideration which ought to weigh with the agriculturists. To debase the currency in any manner would have the effect of raising prices of all kinds, the price of what the farmer would have to buy as well as of the wheat he would have to sell. He must give higher money wages to his labourers. He is a great purchaser of labour, and he would suffer in proportion. But when his produce rose in price proportionally to the debasement of the currency, the corn law would come into operation, importation would take place, his produce would in fact, unless there were a new corn law increasing the import duty, which no legislature collected under the Reform Act will ever pass, be prevented from rising in price in proportion to the debasement of currency. Other produce not regulated by a Corn law, would rise proportionably to the debasement; but the

farmer's produce would not, and he would have to pay the full rise on all he purchased while he would not have the benefit of the full rise on all he sold. We conclude, therefore, that the farmers cannot get any substantial and permanent relief or benefit by any alteration in the currency, beyond four or five per cent., alluded to by substituting silver for gold. Neither can he get relief by any alteration as to Ireland; and to us, we regret to say, his condition seems almost hopeless.

### ABOLITION OF TITHES.

It cannot however be expected that the farmer should lie down and die, or seat himself at the church door and beg for bread. Manhood forbids it; and the brave yeomen of England who were for many centuries their country's pride, will never submit to it. What then is to be done? The present price of the farmer's produce does not pay his expenses. There is no expectation that the price can be raised or can rise adequately; and he therefore must reduce his expenses. One of his outgoings is for labour. That cannot be lowered; for the condition of his labourers is already poor and degraded in the extreme. He cannot do without labourers; it is misery to live surrounded by them in distress and pauperism, and he had better quit the land of his fathers while he can yet establish himself in a country where he may flourish, than make himself the agent of a system of grinding extortion, by which the labourers are demoralized and degraded. We will not however advise him to emigrate.

Another of his outgoings is rent. It has already been reduced; and Lord Western says if it were wholly abolished, the farmer could not succeed. We do not agree to his Lordship's opinion: but while we admit that rent has been lowered, while we assert that it must be lowered still more, it is not to be expected that the landlords will give it up altogether. They would struggle hard for it, they would fight for it, and we do not want to see contests. Besides, the farmers voluntarily agree to pay rent, and if they cannot fulfil their agreements, they must make the best compromise they can.

Another outgoing is the payment of Taxes. There is but little chance at present of that payment being much further diminished. They might get, we believe, a good deal of relief by the abolition of the Corn Law which would assure every body that prices would rise no more, which would be followed by a reduction in the price of labour, cheapening those things the farmer has to buy, and not cheapening the corn which he has to sell; for that cannot be well cheaper. There remains only the Tithes from which he can hope for any relief. They are not a payment in advance, but they are a part of his produce. If the produce of his farm be 100 quarters, and only 90 of them belong to him, while the other 10 are given to the tithe-owner, it is clear that, to cover his expenses, he must sell the 90 quarters for as much as he could afford to sell the whole 100 for, if they were all his own. He will, for example, be in no worse situation if he sell 100 quarters for 45s than if he sell 90 for 50s. To say nothing of the immense annoyance caused by Tithes, it is clear that the total abolition of them would go a long way to place the farmer in a condition, at least to live, if not to flourish.

Tithes are a payment imposed by the law on the farmer. The law, then, can relieve him from this evil; it can cease to act. The tithes exist but by the law;

and while wages, and profit, and rent, grow out of natural circumstances, the mischievous Tithes are altogether the result of ruinous legislation. As the legislature does not create rent, it cannot middle with rent; but it creates tithes; and, in this season of distress, it ought to be called on to abolish them. That will not wholly place the agriculturists in a fair position; but it is the only means by which the legislature can give them any substantial and permanent relief. We recommend the farmers, then, to complain to the legislature of their present deep distress, and to demand the instant abolition of this odious and detestable impost.

"Would you, then, at once," it may be asked, "injure and ruin the tithe-owners?" We have no wish to injure a single individual in the world; but when the question is, whether the farmers or the tithe-owners shall be ruined, we say, let the tithe-owners be ruined. They are fewer in numbers than the farmers; and merely to receive tithes is to confer no benefit on other men. Without the consumers of tithes, the community can prosper; without agriculturists, it must starve or turn pirate-robbers. As the tithe-owners themselves have by their obstinacy brought the question to this issue, it is better, we repeat, that they should perish than the farmers. The produce of the farmer will no longer suffice to nourish the owner of the farm, his tenants, and labourers; and no portion of that produce can therefore be any longer distributed to priests. We would press this subject seriously and earnestly on public attention, because it is quite clear that with the present prices the farmers cannot go on; and there is neither chance nor hope of prices rising. On this subject the danger is immediate, great, and pressing. The little discontent, just though it be, caused by the want of regulations for Dissenters' marriages, by bribery, and intimidation at elections, by a short franchise or an imperfect system of registration, is as dust in the balance compared to the danger arising from the price of agricultural produce not remunerating its growers. We are afraid, if the legislature does not take up this matter in time, and take it up with a view of relieving the farmers from the necessity of resisting the law, that the law will be resisted and scenes similar to those which have been witnessed in Ireland will transform the once happy valleys and smiling hills of England into seats of civil commotion and bloodshed. The land-owners, the tithe-owners, the tenants, and the labourers, can no longer be supported by what the produce of the land will fetch in the market; and the first who ought to suffer should be the tithe-owners. They deserve to suffer, too, from other considerations. For the sake of tithes, they cherish malice, they foster strife, they provoke bloodshed; they have obstinately, unjustly, and cruelly resisted all attempts at a compromise; and the farmers therefore ought now in the midst of their own distress to cry, "Down with the food of all these iniquities,—Down with the Tithes." That should be the chief topic on which they ought to demand redress of the legislature; and they ought no longer to ask for commutation, but abolition, of tithes. Why should they starve—why should they perish—why even should they suffer the slightest injury or inconvenience, in order that the priesthood may continue opulent? It is consistent with justice, with honour, and honesty, for the cultivators of the soil now to demand that the legislature should relieve them from an impost which is alike destructive of religious feeling and national prosperity. Farmers should therefore petition for the instant Abolition of Tithes.

## THE EFFECT OF THE PRESENT PRICE OF GRAIN ON THE AGRICULTURE OF THE COUNTRY.

TO THE EDITOR OF THE "FARMER'S MAGAZINE."

SIR,—In this letter I propose to confine myself to the mention only of those causes—within the jurisdiction of parliament—which I think to be the chief operating causes of the present agricultural distress, namely, the effects of Peel's bill—the want of poor laws in Ireland—the tax on malt—and the constant attacks made by a certain section of the house of commons on the corn laws. The "Debt" I know is by many persons ascribed to be the sole cause of the present depressed state of things; and this is quite true, the "debt" is the main-spring of the whole, but as it appears to me to be impossible to modify to any considerable extent this great moving cause, provided a due regard be paid to national honour and faith, it is better I think to turn our attention to such collateral matters as may bear directly on our separate interests, than it is to be satisfied by the vituperative mention of the "debt," for in the end it can amount to no more than reflection and complaint, whereas, on the contrary, the mind of the nation directed to "Peel's bill," poor-laws in Ireland, and the malt-tax, and the petitions of the people calling the attention of the legislature to those subjects alike vital to the interests of the community, and capable of being effectually dealt with, may at least be attended with some good result. I am led to the above observations by having the other day heard an intelligent reader of your Magazine, assert that it was impossible essentially to relieve the present depressed state of agriculture so long as the "debt" existed.

In order to inquire into the object I have now in view, the effect of the present low price of grain, or the agriculture of the country, I will divide the land into four classes of rental: the first class at forty shillings per acre; the second at thirty shillings; the third at twenty shillings; and the fourth at ten shillings; and then proceed to examine how under present circumstances each of these different soils is likely to be affected. It may be as well perhaps to premise the following observations by explaining that I mean the above scale of rental to apply to leases entered into in 1830 for seven years, and that in fixing a data of rental value by which my views on this subject will be regulated, it must of course apply generally, and not in partial instances, or in particular situations by which the rental value of land may be either increased or depreciated, and although I have not mentioned in the above scale, land of a higher value than forty shillings per acre, or of less value than ten shillings per acre, still the principle will apply with the exceptions only I have before explained.

We will take first into consideration the poor heavy clay soils in the wealds of Sussex and Kent, or the 10s. per acre land. This description of land will not detain us long in our enquiries of the effect of four or five shillings a bushel for wheat. It must immediately go out of cultivation, and it requires no calculation to prove this beyond an estimate of the expenses of a clear fallow to produce five sacks of wheat, and the charges attendant on harvesting and bringing those five sacks to market. The farmer, on wet and poor land, depends entirely on his wheat crop to pay his rent, labour, and poor-rate. From the heavy and adhesive nature of the soil he is obliged to keep a great proportion of horses to the number of his acres, these horses consume his oats, and his ground will not produce barley or carry

stock, consequently it is his wheat, and his wheat alone on which he depends, and if this grain fail him, either in crop or in price, he has no other resource to depend on. I should, perhaps, except from this total dependence on the wheat crop, those particular districts of country in which the land is of the exact nature described above, but where the cultivation of hops is attended to. Now, here of course, the low price of wheat will not have the direct and immediate effect of causing the cultivation of this land to be abandoned, that it will where hops are not grown. But, although the cause, (viz., the low price of wheat,) in hop counties, may not be quite so direct, still it may be equally rapid and ruinous in its effects, for I am satisfied in the event of a failure of the hop crop, unprecedented ruin and distress would follow in those districts, where from situation and other circumstances, the speculation of hop farming is adopted. The truth is, that the low and ruinous price of wheat for the last three years, has been the means of completely withdrawing both the *attention and manure* from the fallow for wheat to the hop garden, and the farmer has now consequently but one *string to his bow*, instead, as formerly, of having a two-fold dependence: if his hops failed, he had his wheat; and if his wheat failed, he had his hops, because then the manure from the fold-yard was taken to the fallow for wheat, and lime, rags, &c., being purchased for the hop-garden. Now, by the low price of grain, the means of purchasing manure for the hop-ground is destroyed, and consequently the farm-yard dung is taken to the hop-garden as the resource most to be depended on.

The twenty shilling per acre land I will identify as the thin high land or flock farms, and to be understood as to the soil I now allude to, I will just state that a fair proportion of down must be included—without rent—in order that the arable and pasture may produce a rent of twenty shillings per acre. Farms of this nature are usually sown in five lays, or wheat once in five years. Now I think I may affirm in the whole, that land in this class, and under the above circumstances, has made its way since the autumn of 1832, better than any one of the other classes of land I have mentioned, and for the following reasons. The harvest of 1832, although generally abundant, was especially so, in reference to the annual average growth, on soils of this description. In order to instance a fact corroborative of this opinion, I will mention a circumstance which occurred within my own knowledge. A light and poor field of a calcareous nature, forming part of a flock-farm, in the harvest of 1832 produced a load of wheat, of forty Winchester bushels to the acre; subsequently to that time a valuation of the parish has occurred, and this field was estimated to be worth 8s. per acre to rent. The wheat grown on this field in 1832 was sold for 12l. per load. Now, calculating thirty years purchase on the rental value of the land, the crop of corn grown on it in 1832, exclusive of the straw, was worth a sum equal to the fee simple of the land itself. Then also the high price of sheep since 1832, and the high price of wool since 1833, have been advantages almost exclusively enjoyed by the flock farmer or breeder, and have, in a great degree, compensated him for the low price of his wheat and his short crops—in 1833 and 1834—of spring corn. But the late high and unnatural price of sheep—I mean unnaturally high relative to the price of wheat—must have an end, in fact I may say it is fast coming to an end, for tegs and couples are now fifteen per cent. reduced in value from this time last year. This change in the price of sheep is undoubtedly brought about by the flocks being now pretty generally renovated from the destruction of the rot,

which occurred about six years ago. It was at that time computed that the stock of sheep in England amounted to thirty-two millions, and that eight millions were prematurely destroyed by the disease. If this calculation be nearly correct, it is no matter of surprise that sheep for the last few years have been in demand at a high and remunerating price. However, as I have before observed, this exclusive advantage to the flock farmer must and will have an end, and now let us consider his situation when deprived of this advantage. He feels the shoe begins to pinch, for he finds he has to sell his wheat at from five to six pounds a load less than he calculated when he took his farm. Lent corn perhaps may be a good price, but then his crop will be short, for, unless the crop of Lent corn be bad, and so reduce the supply below the demand, it is folly but to suppose the price of oats and barley will be regulated by the price of wheat. This has been exactly the case during the past year; entirely mistaken is the notion that the farmer has benefited by this circumstance, or, perhaps, I ought rather to say the notion is a mistaken one which supposes the farmer has not been minus in the same proportion in the sum derived from his Lent corn of the last two years, that he has been minus in the sum derived from his wheat, and, consequently, he feels it would be futile to attempt to sow more spring corn and less wheat—as some wise heads have suggested, and if we take it for granted, as I surely think we may, that the price of sheep will be reduced in the proportion of other agricultural produce, it would, in such case, be no advantage to make any sacrifice of corn in order to supply sheep feed. Now this last expedient has been much resorted to for two or three years. Five shillings, or less than five shillings a bushel for wheat, will destroy every alternative to the farmer but to sacrifice immediately his capital, or else to sacrifice the high cultivation of his farm, by sowing to the extent of the terms of his lease. Thus he may protract his ruin for a year or two, and if he depends entirely on his capital invested on his farming stock, his destruction, with the present price of wheat, cannot be delayed beyond that time. Here, where the rape should be luxuriantly growing, we shall find a meagre looking corn-field, stunted barley or oats. Here, where the tares should be ready to afford an afternoon repast for the sheep coming from the down, oppressed with heat and thirst in a hot June day, to enjoy themselves with this succulent provision, we shall find the foul and unhealthy looking peas or beans, or else worse than either, the tares saved for seed, and the sheep themselves huddled together on the down, and by their high hips, long necks, sharp back-bones, and every now and then “complaining tones of voice,” speaking volumes of the poverty of their owner, and the destructive effects of five shillings a bushel for wheat.

The thirty shilling land comes next on the scale, and this I shall divide into very different descriptions of soil; that is to say, the best shraives and sands on good turnip land, and the strong wheat soils, being generally a mixture of clay and decayed vegetable mould capable perhaps of producing as much wheat as more valuable land, but less prolific of clover, barley, and turnips. The first I have mentioned, the best shraives and sands, or good turnip soil, is usually called good four lain land, or sown with turnips once in four years, thus, keeping a great deal of stock to prepare for the butcher. On this description of land, of late years, the happiest combination of stock with corn has been adopted; in fact, as regards the pursuit of farming, as a means of exercise and recreation, this soil affords by far the preference to any other description; but as our object

now is any thing but recreation, I will not enlarge on the peculiar advantages land of this nature affords under ordinary circumstances, but pursue the enquiry as to how it will be affected by five shillings a bushel for wheat. A person who had suffered both from gout and rheumatism, was once asked which of the two diseases he thought the most painful. Put your finger into a vice was the reply, and screw, screw, screw, as long as you can bear it—never mind your distorted countenance and dancing feet—but screw as long as you can by possibility bear it, there, that is the rheumatism; now, one screw more than you can bear, and that is the gout. Just so is it now with the flock farmer on the twenty shilling land, and the “four lain” farmer on the thirty shilling land. The flock farmer has the rheumatism, the “four lain” farmer the gout. The late high price of sheep has been but comparatively little worth to the “four lain farmer,” because the price of lean sheep has been much higher in proportion than the price of mutton, and as the “four lain” farmer buys all his stock, it is obvious the benefit must have been peculiarly the breeders. The “four lain” farmer calls in a friend, the lease is produced and examined to ascertain if by the covenants it is possible to pursue a harder course of sowing in order to meet the present necessity. Perhaps it may now be found that the tenant is not absolutely tied to the four lain course of husbandry, and that he can sow somewhat more than a half of his farm with corn, and a greater proportion with pulse than he had lately done, and by chance he may also discover that he is not restricted from planting potatoes; all this is pointed out to him by his sagacious friend, accompanied, however, with the observation, that although these expedients may relieve him for a time, they will eventually increase his difficulties in a ten-fold degree. Future difficulties, however, form no part of a man’s present distress, who is in imminent danger of his life, and thus it is with the impoverished farmer—all is sacrificed to the necessity of the moment. The other description of soil I wish to recognise as thirty shilling per acre land, is, as I have before stated, strong wheat land, but by high cultivation, draining, &c., &c., capable of producing good crops of turnips. This land, when under the best system of cultivation, is sown in four and two lains, or wheat once in three years; turnips once in six years, and spring corn sown only after turnips. Now this peculiar rotation of sowing land is but of recent introduction, and it is admirably calculated to improve the fertility of the soil. The different appearance brought about in land of this quality by the above plan of farming, is quite astonishing, and for a period of years I know of no system of management by which a farm of this nature can be made to produce so much money. But, as I have before observed, this excellent plan is comparatively of recent date and consequently there are but few leases which provide for its observance, and where a tenant is not compelled to continue this or any other system of management, which although it may be unquestionably the best and most profitable for a term of years, still is far from being the method by which the most money can be derived for the present, and perhaps succeeding year or two, he will decidedly give up the former and adopt the latter as his only alternative from immediate ruin. Thus, during the last two months, I have seen five shillings a bushel for wheat destroying the system of the “four and two lain” course of husbandry. Under that system, this field which should have been fallowed for turnips, I have seen badly prepared and sown with barley, and where oats have this spring been sown after turnips, and by the above rotation, seeds should also have

been sown with oats, this has been omitted to be done in order that the ground may be sown with wheat next autumn, and the dung mizen which stood in the former field I have mentioned—I mean the field sown with barley, which should in due course have been prepared for turnip, and for which crop the dung would have been necessary—removed to the gate place of the oat-field for the purpose of being used there for wheat. Now the practical man will immediately detect the eventual destructiveness of this necessity on the part of the farmer. The field which should have been turnips to have taken the ewes and lambs during the winter, is in the course of producing about half a crop of barley, and the oat field, where the seeds should have been sown to have kept the couples during the summer, is to have the dung mizen originally intended for the turnip crop, and to be sown with wheat. As there is no provision made for sheep in the autumn, the farmer will not have occasion for an outlay for stock, and consequently stock to him next year can form no source of profit, and thus will difficulty engender difficulty, until five shillings a bushel for wheat has ruined the tenant, and in respect of his situation in society, the landlord also.

There now only remains for our consideration soil of the best description, rich grazing and arable land of the first quality. "*Whip the horse that will draw,*" is an old adage which will be fully exemplified here. As regards the pasture land where the tenant is not restricted from selling hay, the scythe will be used continually, and if he be not allowed this privilege, cattle and sheep to graze must be procured as long as the money to buy them can be found; but the power to command money to buy stock, if wheat remain at its present low price, will soon be destroyed; for although grass land it is true does not produce wheat, the effect of a depreciation in the price of this grain much below the actual cost of production, will have its due effect on pasture as well as on arable land, and this proposition will soon be destroyed as a speculation, and be demonstrated as a fact, provided the price of wheat does not speedily rally, and the result will prove that the grazier will be no more able to keep his footing, than the arable farmer will be able to maintain his—when one slips, the other will soon follow. To the best arable land the whip will be applied without mercy—for *this horse will draw* when all the rest of the team have given it up, and on the best land, of course, a driving system of sowing can be continued longer than on land of an inferior description; but even here it must have an end, at least it must have an end as regards an average production calculated on past years. The most profitable plan of farming *the best arable land*, is, I think, the "three lain system," or wheat once in three years, and only half the proportion of turnip sown, and nearly double the proportion of Lent corn that would be by the "four and two lain system," thus there would be two-thirds of the whole with corn, except a twelfth of the whole sown with turnip, and the remaining third clover, rape, &c., &c. Now the effect of the price of wheat here will be to lose the turnip preparation for potatoes, a most improving root, and the clover and rape; the former which produced the hay to be fed in the yards in the winter, and the latter being fed off with sheep on the land during the summer, will be sown with peas, beans, and tares for seed, and every shilling that it is possible to save either in manual labour or in farming implements, will be saved for the moment,—a wretched economy indeed, fraught with future evil, and that, too, at no very protracted period. On the whole, then, I think it cannot be questioned but that the present low price of wheat

will seriously affect the agriculture of the country, or, in other words, it will eventually reduce our means of production. How far this is to be considered a national evil I leave to the consideration of others, with the hope that the above observations may have some effect in dispelling the fallacious notion that agricultural distress is *partial* and not *general*, or that the low price of wheat does not affect all soils about in the same degree.

I cannot conclude this paper before I have mentioned an extraordinary instance of observance and industry. The fact was related to me yesterday by a neighbour, whose father was an eye witness of the proceeding. Mr. George Pittis, of Wymering, near Cosham, Hants. A highly respectable farmer, about a fortnight since undertook to draw every ewe with her lamb throughout his flock, consisting of two hundred and eighty ewes and three hundred lambs. This he accomplished much to the surprise of his friends, apparently without effort, and certainly without one mistake. I am, Sir,

Your obedient and very humble Servant,  
Sussex, May 10th, 1835. AGRICULTOR.

**SOUTH AMERICA.**—It is a remarkable thing, that the whole of the water found in the Pampas is brackish; and in hot weather it is most annoying, for drinking it only serves to increase the thirst of the traveller; but it is not unhealthy, and most probably is the contrary in its effects on the Gauchos, who pass entire months without any other nourishment than beef newly killed, without any salt to it, which, like bread, is considered a luxury on the Pampas. When rain has failed for a long period together, many spots become uninhabitable, and the settlers are obliged to remove; the lakes gradually dry up, and a growth of rushes overspreads their bottoms, serving as lairs for the pumas, who lie in wait for the cattle, that, perishing of thirst, with mournful lowing seek the remnants of green stagnant water which lie on the marly surface, thick as refuse oil, and swarming with miriads of mosquitoes. Yet it has ere now been to the writer a sensation of extreme pleasure to dismount from a jaded horse, with his rude companions, and taking the handkerchiefs which shaded our heads from the scorching sun, to spread them on the surface of such a glided puddle, scarce an inch in depth, and thus suck away the moisture, whilst the whizzing insects buzzed around, as if in anger at our thus drying up their fishing waters. As the water becomes gradually more scanty, the rushes wither—the dry pasture catches fire from the smouldering horse dung, left burning by some chance traveller: the flame sweeps along, and, fading as fast as it advances, resembles a fiery knife-edge mowing the wide plains. As it passes by, the rushey oases are kindled, and fierce flashes mount upwards, with each breath of air, like the blasts of volcano. The wild animals rush forth before the destroyer, and seek for a bare spot, or the intersecting line of a stream, which may afford them shelter. But it is a fearful race for life or death, for the flying flame over the parched level mocks the speed of the swiftest horses of the plains. On some occasions a caravan of the straw-thatched waggons of the interior provinces is overtaken, and waggons, oxen and drivers perished together. We once beheld four drivers still living, who had thus been roasted alive. They had been laid in a shed with their burnt garments shrivelled into cinders on their skinless bodies, to live or to die according as the vital energy might conquer or succumb, for there was no help of medical skill to avail them.—*London Review.*

## ON LONDON DRAUGHT PORTER AND ALE.

The London ale and porter prepared for pot-houses are very different in quality, and infinitely more deleterious in their effects than the same description of liquor made for private families; although malt, hops and water be employed to form a very strong fermented liquor, still it is mild to the taste, while the pot-house ale and porter are harsher and stronger than could possibly be made by any quantity of malt, hops, and water. This harshness, therefore, of pot-house fermented liquor must be caused by some other admixture than malt, hops, and water. Some have been of opinion that such harshness and stupefying effects, as uniformly result from the profuse use of these liquors, cannot possibly arise from the spirit imparted to them by the malt, but from the admixture of *coccus indicus*, *nux vomica*, and other deleterious substances. That some sort of improper substances are mixed with them, either by their manufacturers or vendors, is evident from the circumstance of the cheapness of the articles in question. Besides, their effects on the constitution are always different from what is produced by home-made porter and ale. None who have been accustomed to use the latter but on substituting the pot-house ale and porter have almost immediately suffered a derangement of their digestive organs. Again, we find those who constantly habituate themselves to the use of pot-house liquors are involuntarily led to the use of other substances to counteract their bad effects on the stomach. It is a curious circumstance that such measures are generally adopted without the individual employing any sort of reasoning on the subject, but only because they feel them of use. The most common of these habits are smoking tobacco and drinking gin. I have made strict inquiry at various houses where great quantities of ale and porter are sold, and have ascertained that scarcely any one who indulges freely in the use of such draught liquors but at length becomes a dram-drinker, or learns to smoke tobacco. Another curious circumstance which I have ascertained adopted by those who indulge freely in the use of those liquors, is that those who are subjected to hard labour, such as coal-heavers, are not so apt to indulge in smoking tobacco and drinking gin as those who remain in a state of inactivity during the time that the porter or ale exert their effects on the stomach. It would thus appear that great exertion of the body is somewhat equivalent to the action of the tobacco or gin in obviating their bad effects on the stomach, and consequently it is evident that the free indulgence in their constant use is inconsistent with the healthy functions of that organ.—*The Oracle of Health.*

**DOCILITY OF OXEN.**—My man in Long Island used, in summer time, to go out with his yoke and his bows just at break of day; that is to say, as soon as he could see the oxen at fifty or sixty yards from him; for there it is a great thing to get the main of the work done before ten o'clock, and after five, in order to avoid the burning heat of the day. As soon as the man got a sight of the oxen, for the space was large, he used to call out '*Haw Boys!*' At the second call, somewhat more loud than the former, the oxen used to rise up and look at him, and then look at one another. When he approached them near enough for his words to be distinctly heard, he used to call out, '*Come under!*' upon which the oxen began to walk off slowly towards him. The next words were, '*Come under! I TELL ye!*'

pronounced in a very commanding and even angry tone, upon which the oxen set off to him at full trot, bringing their heads up close to his body; and, putting the yokes round their necks, each fastened at the top with a little piece of wood, away he walked, and they after him, into the field, where a single plough-chain hooked on to a ring in the yoke sent the plough along in a minute.—*Cobbet's Treatise on Indian Corn.*

## SUGAR-MAPLE TREE.

Maple is the common name of the *acer* genus of plants, of which there are thirty-four species. Nine of these belong to North America, twelve to Europe, six of great beauty to Japan, and the rest to different parts of Asia. The timber of the maple is not adapted for works of durability and strength; but, from the beauty of its texture, it is peculiarly fitted for ornamental purposes; and the variety called "curled maple" is, on this account, held in great esteem. It is capable of being highly polished, and is sometimes employed with good effect in inlaying; but is most commonly used for the stocks of fowling-pieces, for work-boxes, and other articles in which it is desired to combine utility with ornament. Its lightness occasions it to be also frequently used in the manufacture of musical instruments. The sap of the maple contains a certain quantity of saccharine matter; but two of this genus (*acer saccharinum* and *acer nigrum*) yield so abundant a supply as to have obtained for them the general designation of the sugar-maple. The former of these trees is found in North America, between the 42nd and 48th degrees of latitude—that is, in the northern parts of Pennsylvania, the western portion of New York, in Upper Canada, Nova Scotia, and the northern parts of New England. The *acer nigrum*, or black maple, flourishes in rather a warmer climate, and is most abundant on the banks of the Ohio and the great rivers of the western states of America. These trees furnish excellent fuel, and the ashes are manufactured into potash. The maple is not surpassed by many trees in the variety of purposes in which it may be usefully employed.

The 'Encyclopædia Americana' states, that maple-sugar could be manufactured in sufficient quantities to supply the consumption of the United States; but, of course, without any intention of insisting upon the advantage of affording national encouragement to this domestic manufacture. In the newly-settled parts of the United States, and in Canada, where the inhabitants are often placed at great distances from each other, and the opportunity of effecting exchanges is very imperfectly enjoyed, domestic manufactures of various kinds may be wisely undertaken, to engage in which would obviously be mere waste of time in a different and more advanced state of society. Accordingly, we find that, even in those districts of America where the sugar-maple abounds, it is only in remote parts of the country that its manufacture forms a regular branch of rural economy, and where a reserve is made by settlers of from 200 to 500 maple-trees for a "sugary."

The sugar is said to equal the common brown sugar of the West Indies, and, when refined, to yield to none in purity and sweetness. The produce of a single tree appears to vary considerably—by some it is said to amount to five or six pounds, and by others it is estimated as high as thirty-three pounds per tree; but this amount can probably be obtained only under a concurrence of peculiarly favourable circumstances, and in the southern states of America; for in Canada the average produce of the season for one tree is stated by Evans, in his 'Emigrants' Direc-

and Guide to the Canadas,' to be not more than two pounds. The sugar is worth from fourpence to sevenpence halfpenny per pound. Two men can attend to 300 or 400 trees. A family may even make 1,000 lbs. of sugar in the course of a season, which commences towards the end of March, and lasts a month; and fortunately happens at a period when agricultural labours have not resumed their activity.

The following account of the process of sugar-making is taken from Evans's 'Emigrants' Directory,' quoted above:—"A large gouge, or hollow chisel, should be provided, and a piece of dry pine or cedar got, and cut into lengths of about nine inches each. These pieces should be split into bolts, about half an inch thick, the breadth of the gouge; and these bolts again split up with the gouge about a quarter of an inch thick, by which they will become hollow spouts, like the instrument with which they are cut, for the sap to run in: they should then be pared with a sharp knife at the end, to the shape of the edge or point of the gouge, so that when it is driven half an inch or so into the tree, the spout also may be driven into the incision, and fit it tightly. Troughs, to receive the sap as it falls from the spout, are made of pine, fir, or ash, and being split into two, each half piece is hollowed out with an axe, so as to contain about two gallons. Each tree of ordinary size will require one, and very large trees two troughs. Buckets, which cost about tenpence each, save much more of the sap than the troughs. A tree will run about a bucket-full per day, on days succeeding frosty nights with a moderately warm sun to thaw the sap.

"After all these have been prepared, one or two of the troughs being placed under each tree, the person holding the spouts, gouge, and an axe, makes with the corner of the axe a small sloping notch about an inch and a half long, and deep enough to penetrate into the wood of the tree about half an inch; the under side of the incision being cut sloping down into the tree, so that the sap may run to its lowest point: if fit to tap, the sap is seen immediately to ooze from the cut. About an inch under that, the gouge is driven in for the spout as before directed, through which the sap is conveyed down till it drops into the bucket or trough at the foot of the tree, the cut being almost two feet from the ground: one man can thus tap about 200 trees or more in a day. One tapping generally answers for the season, and the trees, if not greatly hacked, will do for a sugary many years."

The sap is collected daily and carried to the boiling-place, when it should be put into puncheons or barrels; or large logs, hollowed out, will, in case of need, serve the same purpose. Mr. Evans gives the following directions to be attended to in the process of boiling:—"Two stout crotches are fixed upright in the ground eight or ten feet asunder, and on them is placed a cross stick from which pots or kettles are hung; a crook to hang them by being made of a crooked piece of wood. The fire is made underneath of split or small wood between two larger logs rolled on each side. The sap should be strained into the boilers, and when boiling down, one boiler should be kept filled from the other, and that again supplied from the others till the liquid be boiled down to the consistency of syrup. It is then taken up and strained into a deep narrow vessel, where it is left to settle for a day or two. When about being sugared off, it is carefully poured from the sediment into a small boiler, and again hung over a slow fire; a little milk, or a couple of eggs beat up, being put in to clarify it: as it boils it is skimmed, and, after boiling about an hour to a proper consistence, it is poured

into vessels to cool, and stirred occasionally till cold. The best mode is not to boil it too dry, but to pour it into a barrel after boiling sufficiently, and when cold the sugar begins to crust on the surface in a day or so; after which, by having a few gimlet-holes bored in the bottom of the barrel, the molasses will run off, and leave after it a clean fair sugar. To prevent the sap or syrup from boiling over, about an inch square of fat pork should be thrown in once or twice a day, and it will be found to have the desired effect. The scum, sediment, and last run of the sap from the trees which is not good for sugar, should be boiled together, one-half down, and, being barrelled, will, by allowing it to ferment, make good vinegar."

## HISTORY OF THE COTTON MANUFACTURE IN GREAT BRITAIN.

By EDWARD BAINES JUN., ESQ.

London: Fisher, Fisher and Jackson.

The author of this work, who is the son of the distinguished Member for Leeds, has displayed great ability in its execution. He has produced a book which is not only of infinite value to those who are engaged in the manufacture of which it treats, and those who devote their attention especially to the political economy and commercial affairs of Great Britain, but is also highly interesting to the general reader. In tracing the history of the cotton manufacture in every country in which it has existed, and giving a complete account of its present state, he has introduced many curious details which enliven his subject while they illustrate it. The work contains a full and comprehensive view of the rise and progress of this manufacture in England; of the series of inventions which have brought the spinning and weaving machinery to its present state; of the manner in which every branch of the manufacture is carried on; and of its influence on the prosperity and social state of Great Britain. An ample and interesting account is also given of the state of the cotton manufacture in the East Indies; and the work concludes with a description of its situation in those nations which are now endeavouring to compete in it with this country.

In his preface Mr. Baines gives an astounding idea of the rise of the cotton manufacture within these last sixty years:

"Sixty years since our manufacturers consumed little more than three million lbs. of raw cotton annually; the annual consumption is now two hundred and eighty million lbs. In 1750 the county of Lancaster, the chief seat of the trade, had a population of only 297,400; in 1831, the number of its inhabitants had swelled to 1,336,854. A similar increase has taken place in Lanarkshire, the principal seat of the manufacture in Scotland. The families supported by this branch of industry are estimated to comprise a million and a half of individuals; and the goods produced not only furnish a large part of the clothing consumed in this kingdom, but supply nearly one-half of the immense export trade of Britain, find their way into all the markets of the world, and are even destroying in the Indian market the competition of the ancient manufacture of India itself, the native country of the raw material, and the earliest seat of the art."

The following passage is still more striking; and we recommend the conclusions he deduces from the facts stated by him to the attention of those who lament the increase of machinery:—

“Of the fifteen hundred thousand individuals whom the cotton manufacture now supports, the greater number are in the county of Lancaster. In the year 1700, Lancashire numbered only 166,200 inhabitants (about the present population of one of its seaports, and less than that of its manufacturing metropolis;) in 1750, the population was 297,400; in 1801, it had grown to 672,565; and in 1831, to 1,336,854; being an increase of more than eight-fold in 130 years, of four and a half-fold in the last eighty years, and of two-fold within the last thirty years! The population of Lanarkshire and Renfrewshire, the principal seats of the manufacture in Scotland, has increased in an almost equal proportion. The parish of Manchester has increased from 41,032 inhabitants in 1774, to 270,961 in 1831 (the date of the last census;) Liverpool, from 31,050, in 1770 to 165,175; Glasgow, from 28,300, in 1763, to 202,426; Paisley, from 17,700, in 1782, to 57,466; Preston, from 6,000, in 1780, to 33,112; Blackburn, from 5,000, in 1770, to 27,091; Bolton, from 5,339, in 1773, to 43,396; Wigan, from 10,989, in 1801, to 20,774; Ashton, from 5,097, in 1775, to 33,597; the parish of Oldham, from 13,916, in 1789, to 50,513.

“Such are the amazing creations of the cotton machinery. At the beginning of the reign of George III. (in 1760,) probably not more than forty thousand persons were supported by the whole cotton manufacture: machines have been invented, which enable one man to produce as much yarn as two hundred and fifty or three hundred men could have produced then—which enable one man and one boy to print as many goods as a hundred men and a hundred boys could have printed formerly; and the effect has been that now the manufacture supports fifteen hundred thousand persons, or upwards of thirty-seven times as many as at the former period! Yet so profoundly ignorant, or so blindly prejudiced, are some men, even authors and members of Parliament, that they still publish solemn lamentations over the growth of machinery! It might have been supposed that the history of the cotton manufacture would have for ever put an end to the complaints against machinery, except on the part of the workmen who were immediately suffering, as some generally will for a time, from the changes in manufacturing processes. The 150,000 workmen in the spinning mills produce as much yarn as could have been produced by 40,000,000 with the one-thread wheel; yet there are those who look on it as a calamity that human labour has been rendered so productive! these persons seem to cherish secretly the preposterous notion, that, without machinery, we should have had as many hands employed in the manufacture as it would require to produce the present quantity of goods by the old processes; not considering that the population of all Europe would have been quite inadequate to such a purpose! and that, in reality, not one-fifth part of those now employed as spinners ever would have been employed under the old system, because there would have been little or no increased demand for the coarse and high-priced goods then made. If a spinner can now produce as much in a day as he could last century have produced in a year, and if goods which formerly required eight months to bleach, are now bleached in two days, surely these are the very causes of the

amazing extension of the manufacture, and are therefore subjects of rejoicing, not of lamentation.”

The work is illustrated by a number of engravings and wood-cuts, consisting of portraits, and representations of buildings, machinery. &c., executed with great beauty and spirit.

### A CHALLENGE.

[We insert this, in the hope of its being answered by some of our readers.—Ed. M. L. E.]

TO THE EDITOR OF THE HEREFORD TIMES.

SIR—I trust the present depreciated price of wheat will open the eyes of the farmer, to the end that he will abjure the fallacy of supposing that Corn Laws can protect *him*. The gazette price of wheat may now be taken at 40s the quarter (too high a quotation;) the duty on imported wheat is, therefore, about 46s. Now, the average price of Baltic wheat in London may be taken at 30s per quarter; add to which, the duty, and then we have a total of 76s as the price of North European wheat in England. Is not this demonstration, that agricultural distress would exist if our scale of import duty were double or treble what it is at present; that distress cannot possibly have any thing to do with the English farmer competing with the foreign grower?

Where, then, is the cause of the English farmer's distress?—where, but in his cost of production being too great relatively with that of the Scotch, but more especially with the Irish farmers. This is a wide subject, and I will not trespass upon your space by entering upon it, further than to call upon any Tory, Whig, or Radical, to point out where the English farmer can look for effectual relief, except to the following sources:—a reduction of rent to the point it was at when wheat was in the last century sold, in the Hereford market, at 5s the bushel;—a commutation of tithes, so that tithes shall be completely merged in rent;—a considerable relief in the county rates, by a release from the performance of the statute duty, and the prosecution of criminals;—the imposition of poor-laws in Ireland, and such an administration of government in that country, that the Irish people may be enabled to consume more of their own produce at home, and thus be raised from a state of wretchedness to one of comfort, and be spared the horrible slavery of wearing out their bones and muscles in the production of the means to support an absentee gentry and a sinecure plethoric Church, in order to *undersell* the English farmer.

A HEREFORDSHIRE FARMER.

Near Hereford, May 4, 1835.

HANTS.—At Cuffnells, near Lyndhurst, there is a celebrated Rhododendron ponticum, considered the largest in England. Although the plantations of the American garden at Cuffnells are of small extent, and do not contain any great variety, they are laid out with great taste, and there are some fine specimens of the commoner rhododendrons and old azaleas. In the shrubberies are some four or five fine specimens of *Halesia diptera* and *tetraptera*; but they are so overgrown with other trees, that they would be useless as portraits. There is also in a small sheltered garden, a fine *Edwardsia microphylla*, which, having been originally planted against a low wall, has grown many feet above it, and has no protection whatever.

It flowers freely, and produces fertile seeds, plants from which have been given to several people, in hopes that the individuals proceeding from seeds ripened in our climate may prove more hardy, and perhaps succeed as standards. In the same garden is a very large plant of a species of *Metrosideros* with white flowers, which has grown for years without the least protection, and flowers most abundantly, *Maurandya Barclayana* is perennial with us; but commonly dies down in the winter, shooting vigorously in the spring. *Acacia armata* has been against a wall (north west aspect) for two winters, and is now covered with abundant bloom, just bursting into flower. This plant has a mat in frosty weather. In the conservatory we have some fine old plants of *Acacia armata*, *Acacia scolopendron*, and some fine old conservatory plants.—E.P. (*in Gardner's Mag.*) Feb. 5, 1834.

## SATURDAY AFTERNOON.

(*Ry Willis, an American Poet.*)

I love to look on a scene like this,  
Of wild and careless play,  
And persuade myself that I am not old,  
And my locks are not yet gray;  
For it stirs the blood of an old man's heart,  
And it makes his pulses fly,  
To catch the thrill of a happy voice,  
And the light of a pleasant eye.

I have walked the world for fourscore years;  
And they say that I am old,  
And my heart is ripe for the reaper, Death,  
And my years are well-nigh told.  
It is very true; it is very true;  
I'm old, and "I 'bide my time;"  
But my heart will leap at a scene like this,  
And I half renew my prime.

Play on, play on; I am with you there,  
In the midst of your merry ring;  
I can feel the thrill of the daring jump,  
And the rush of the breathless swing.  
I hide with you in the fragrant hay,  
And I whoop the smothered call,  
And my feet slip up on the seedy floor,  
And I care not for the fall.

I am willing to die when my time shall come,  
And I shall be glad to go;  
For the world, at best, is a weary place,  
And my pulse is getting low:  
But the grave is dark, and the heart will fail  
In treading its gloomy way;  
And it wiles my heart from its dreariness,  
To see the young so gay.

THE HUNTER.—On calm and deliberate investigation it will be found that, in summering the hunter, we should be guided by circumstances in regard to the constitution or the diseases of the horse. I am no advocate for a summer's run at grass in the general sense of the term; where, however, the horse happens to be foundered, vulgarly called groggy, but more elegantly and more scientifically expressed by the *navicular disease*, there is no system of absolute stable management from which the afflicted animal can derive so much benefit, as from the cooling grass, and particularly from the evening dews. Hunters, from being shod short before, are very liable to corns,

which are more likely to disappear from a summer's run at grass, than from summering in the stable. Further, a delicate feeder, an animal that requires the administration of an occasional diuretic ball, will enjoy better health in the open air, than amidst the effluvia of the stable. But, where the animal possesses a thorough good constitution, and is free from organic or less serious disease, though I would suffer him to enjoy a few hours daily in the open air, from the middle of the month of May to the latter end of June, I would by no means expose him to the danger of an unrestrained summer's run. Nature and art should go hand in hand; let us adhere as strictly to the rules and guidance of the former as circumstances will allow, but endeavour to assist her operations according as the semi-artificial system to which we have subjected the horse, seem to render essentially necessary.—*Sportsman and Veterinary Recorder.*

THE BRIGG AGRICULTURAL ASSOCIATION held their first anniversary meeting at the Angel, Brigg, on Thursday the 7th May. The report of the committee was read—the President and Vice President were requested to continue their services the ensuing year—the other officers of the society were chosen, and the vacancies occasioned in the committee by the retiring members, who were removed by lot in accordance with the sixth rule of the society, were filled up. After the business of the meeting was disposed of, upwards of fifty gentlemen sat down to dinner. Thomas George Corbett, Esq., M.P., President of the Association, in the chair; supported on his right by the hon. C. A. W. Pelham, M.P., who came from town for the express purpose of being present on the occasion. On the cloth being drawn several loyal toasts were first drank—afterwards those which the occasion called for. Several gentlemen addressed the meeting. The report of the committee was again read (of which we subjoin a copy), and much commended by the two hon. members of this division, for its temperate and judicious statement of the condition and prospects of the farmer. They both evinced their anxiety to promote in any way they could the interests of agriculture, and expressed their regret that so much apathy should exist in the agricultural body, and so much want of union. Mr. Pelham observed that in the petitions to parliament for the relief of agriculture, almost as many plans were proposed as petitions were presented, which caused their opponents to say that the farmers did not know what they wanted. This was contrasted with the zeal and activity of the manufacturers, who were united to a man in their endeavours to obtain any particular object they might have in view.—The chair was most ably filled by the President, and many important subjects connected with agriculture brought forward by him, Mr. Pelham, and other gentlemen. The formation of a Central Agricultural Association in London, was considered by the meeting very desirable, which both the members undertook to promote as far as they could.

### [REPORT OF THE COMMITTEE.]

"Gentlemen,—Your committee exceedingly regret their inability to congratulate the Association upon the improved condition or prospects of the agriculturists. On the contrary, they have to lament their increasing difficulties, arising from the low price of produce. During the last year wheat has been gradually decreasing in value, and has now reached a lower point than at any time during the last fifty

years: the average for this county, on the week ending the 21th of April last, being 35s. 9d. per quarter.

"Your committee also lament that all the expectations they had entertained of relief have been disappointed—they cannot also but deeply deplore the continued excitement in public affairs which (they conceive) prevents their situation receiving that serious consideration from the legislature which it so imperiously requires.

"Your committee fear that a large portion of the manufacturing, commercial, and moneyed interests (notwithstanding the low price of food) continue to entertain the desire of introducing foreign corn into this country at a nominal duty, and that they are only waiting for a favourable opportunity of effecting their object: they therefore urge upon the members of the Association, and agriculturists generally, the necessity of union and watchfulness, and entreat every member to do his utmost to strengthen this Society by obtaining additional members.

"Your committee naturally and anxiously look for some ray of hope to cheer the gloomy prospect, and much would they rejoice to be enabled to point you to it; they feel bound, however, in candour to admit their hopes are faint; notwithstanding, they do not despair, and whilst they would caution you against the vain hope of obtaining adequate relief by a remission of taxes, they do trust that the legislature will be enabled so far to alleviate your condition, by a remission of taxes, by increasing without depreciating the circulating medium, by elevating the condition of the cultivators of the soil in Ireland, and by such other measures as in their wisdom they may devise, as will enable you, with the considerate assistance of your landlords, to maintain your station in society, and share with your fellow-subjects the blessings of peace and prosperity."

## THE WOOL TRADE.

Odessa, April 10, 1835.

Of wools, in the course of 1834 there have been exported to England, 34,500 Poods; to Belgium 4300 Poods; to Holland 1000 Poods; and to the Mediterranean 29,000 Poods; being much the same quantity as in 1833, but considerably more than in any preceding year. It is a remarkable fact, that the violent fluctuations which this article has experienced during the last eighteen months in most other markets, have not been felt here in the same degree; neither the advance that towards the close of 1833 took place, nor the subsequent decline, having been so great as elsewhere. The independence which in this manner our market has shown, may partly be explained by our extensive home consumption, partly by the large vent which our Wools find in the Mediterranean; the predominant influence, however, of the British market, particularly with regard to fine Wools, can by no means be denied. Least of all has been subject to the late decline, our Common Washed Land-wool, the demand for which since several years has been steadily increasing, and has last year considerably exceeded the production. The causes, by which in the expired year the latter has been diminished, and which for some time to come will prevent its regaining the former extent, have been explained by us on a former occasion; we therefore need not again advert to them, suffice it to say, that the opinion expressed in our report of the 1st August ult. has been fully borne out. The demand last spring was very extensive, and long before the clip actually took place,

more had been sold than it eventually yielded. A competition now arose, for the purpose of covering earlier engagements, and the price was enhanced from ro. 17, which in the beginning, and ro. 18, which afterwards had been paid, to ro. 18½ per Pood. Nothing being left for disposal, the market remained in a state of inactivity for the last quarter of the year. The operations for the ensuing clip commenced early; a few contracts were made at ro. 16 to ro. 16½ per Pood, or 5¼d to 5½d per lb, but owners, in proportion to the increased demand, raised their pretensions; at present, no safe sellers are to be found under ro. 17 per Pood, or 5¾d per lb. for delivery in July and August, with three-fourths cash; and the numerous orders in hand render a similar turn of the market to last year very probable. Perevodnoy Wool has been steady throughout last year, at ro. 22½ to ro. 23 per Pood, or 7¼d to 7½d per lb., and continues to be held at the same prices. For Zigay Wool the demand was not brisk, and prices which towards the time of the clip had advanced from ro. 35 to ro. 37 per Pood, since then have become more easy. For the new clip, little has as yet been done; offers are freely making at ro. 34 per Pood, or 10¼d per lb., and ro. 33 to ro. 32 per Pood or 10¼d to 10½d per lb. probably will be accepted, until our home manufacturers come into market, who may raise the prices. A prejudice against this article has been repeatedly observed to exist, but after a few trials this prejudice has always disappeared, as the intrinsic value of the article is proved by the continued and extensive use by our own manufacturers. Of Metis and Merino Wool the greater part of last clip had been early secured on British account. Upon the reverse turn of that market, a good deal was again disposed of here, and even at a profit to inland manufacturers; and it probably may be attributed to these purchases, that prices here have not declined in the same proportion as abroad. Transactions for next clip have not yet been numerous; a fine flock of Merinos was bought for Italy, at ro. 29 per Pood, in the grease; and by a Turkey house some purchases were made at ro. 25 to ro. 25½ and ro. 31 per Pood, but the buyers not being in the Wool trade, no just criterion is furnished by these purchases; and from the less wealthy class of proprietors an abatement may be obtained of 20 to 25 per cent. upon last year's prices; say, Metis at ro. 20 to ro. 24, and Merinos at ro. 25 to ro. 28 per Pood in the grease.

## FEMALE EMIGRATION.

The Emigration Committee has received, in the course of the month, accounts from Sydney, New South Wales, of the arrival there of the David Scott, which left London in July last, with free emigrant females, who had received the Government bounty of 12l. The report of the superintendent of that ship is a highly interesting document, well worthy of perusal by those interested in promoting the benefit of their fellow-creatures in this, as well as in the other hemisphere. It is now almost universally admitted that emigration, conducted in a steady manner, will benefit not only the pauper parishes and the paupers themselves, but also the colonies to which the individuals may proceed. This has been clearly demonstrated in the county of Sussex, where emigration was scouted as a visionary scheme, until within the last five or six years, when it was first encouraged by the Earl of Egremont, who has chartered, at his own expense, several vessels, in order to convey labourers

and their families to colonies where they would find employment at a fair and liberal remuneration. The letters those emigrants have sent home from time to time have been truly encouraging to their friends, who are now as anxious to follow them as they were before sorrowful at parting from them. Painful, however, as it is to witness the depressed state of the male labouring population, how much more so is it to contemplate the deprivation poor females must undergo who depend for their subsistence upon the labour of their hands. In London alone it is reckoned that there are upwards of 6,000 young women, gaining a livelihood by the needle, and the privations they endure must be evident to those who are aware that the wages they generally earn do not exceed 7s a-week, and that too without being provided by their employers with food, lodging, or raiment. In various parts of the country the labour of the female portion of the community is equally depressed. The condition of these classes cannot scarcely be worse in this country, and can it be wondered at that they should avail themselves of the Government bounty, which has lately been increased to a free passage, in order to proceed to colonies where they cannot fail to obtain liberal remuneration for their labour, and where the prospect of a comfortable settlement in life is almost certain, and where their presence alone must improve the social condition of the inhabitants.

The report of Lieut. Marshall, the superintendent of the David Scott, is dated Sydney, Dec. 1, 1834, and is addressed to the Chairman of the Emigration Committee. The very first sentence conveys to the reader a sense of the difficult task which he had undertaken, and shows that, notwithstanding all the care human judgment may bestow upon an undertaking, the working out of the principle on which it is conducted brings to light what could not have been anticipated. The sentence alluded to is as follows:—

“Agreeably to the instructions received from the Committee, I have the honour to inform you, for their information, of the safe arrival, by the blessing of DIVINE PROVIDENCE, of the David Scott, at this place, on the 26th of October, after a fine passage of three months and nine days, not having communicated with any other vessel on the voyage; and although I shall be compelled to state some facts which will give great pain to the Committee, I think on the whole they will have cause to congratulate themselves on the result of their laudable undertaking of transmitting females to this colony, and it is much to be lamented that all on board should not have proved themselves worthy of the parental care of the Committee in providing so amply for their comforts.”

The report then adverts to the misconduct of the chief mate, an officer whose conduct belied every word contained in the excellent recommendations which were given of him to the Emigration Committee, who, not content with the testimonials of Captains of vessels with whom he had sailed, required that he should produce vouchers for his sobriety and morality. The report, however, shows that he was not a person whose presence could promote good conduct on board an emigration ship, or a person likely to be ever employed again by the Emigration Committee. If the first mate behaved in such a manner, how can it be expected that the second mate should not follow his example? This he took care to do, and the result was, that, on arriving at Sydney, tutor and pupil were both incarcerated in the common gaol on a

charge of mutiny, and that too no less grave than striking the Captain. It is to be hoped that the Authorities there will not be induced to show them any leniency. When two of the officers of a ship misconduct themselves so grossly, it is not to be wondered at that any evil lurking in the minds of any of the passengers should display itself, and accordingly we find a statement in the report that about 20 in number did not behave with that regard to decorum which the excellent characters they had received justly warranted the Committee in anticipating. Lieut. Marshall, speaking of the passengers, observes—

“I have had no serious reason to complain of the general conduct of the great majority, although the comfort and happiness of the well-disposed has been so much affected by the conduct of a few abandoned women who have contrived to elude the vigilance of the Committee.

“Of the male emigrants and their families, I cannot speak sufficiently well—better or more useful members of society could not be landed in any colony; and I am proud to bear testimony of the uniform good conduct and content of all of them during the whole time they were under my charge, and it will be a satisfaction to the Committee to know all were well provided for shortly after landing. I cannot close this part without taking the opportunity of saying how much I am indebted to Mr. Croaker for his great assistance to me personally, as well as to the emigrants generally, on the voyage; the good example of his excellent family was also of much service.

“In speaking of the provisions, I have much pleasure in saying they were not *only excellent* in quality, *but ample in quantity*. The bread allowed was certainly never taken up by the parties; and, if I may be allowed to make a suggestion, it is that the allowance of bread be reduced to half a pound, and I am sure that even that quantity was never consumed by the women, as very much was daily thrown overboard when cleaning the decks. Perhaps it would not be amiss to allow an ounce of pork extra in lieu of the reduced quantity of bread; to allow so much is only devoting to waste.

“The ship and her fittings up are two well known to the Committee to need any remark from me—a finer vessel could not be found, to which circumstance I attribute the excellent state of health of the passengers on the passage, having only lost three by death;—one, Mrs. Macnamara, aged 75, who died of dysentery; the second, a young woman, named Mary Ann White, aged 21, who was far gone in consumption when she embarked, died of palpitation of the heart; the third, a boy eight years of age, named Hill, who was in a dying state when he embarked with his mother: a few mild cases of measles among the children closes the account of sickness—indeed, I can confidently assert that the health and appearance of all were much improved by the voyage. I am most happy to say that I have the sanction of the Government for stating that notwithstanding the few abandoned women that got in amongst us, we have landed a greater number of more useful women than any previous ship, the whole of which have been well provided for in a few days after they landed.

“A large and commodious building, with good provisions and every domestic comfort, free of expense, for the accommodation of the emigrants, was instantly provided on our arrival by the Colonial Government, whose extreme kindness, solicitude, and attention to their welfare, is far above any praise that is in my power to bestow; and the Committee will hear with pleasure that their own

care for the future good of the females whom they send out, is nobly responded to by the Ladies' Committee in this colony. Never before did I witness such indefatigable attention, kindness, and affability as was daily shown by them to these friendless women, and not one was allowed to take a place without the applicant undergoing the strictest investigation from some of the ladies as to their fitness to take a servant, a circumstance of no small advantage to females in a strange land; but none had occasion to be in a hurry, as the comfort of all were so well taken care of for the present, and there are plenty of good situations for hundreds more than we brought out. The young ladies who came out as governesses were all engaged within twenty-four hours after their arrival; they are a class of persons much wanted in the colony, 30 more than we brought out would readily have found situations, and many of superior attainments, I have no doubt, would do very well. If so humble an individual as myself may venture to give an opinion, I should most respectfully urge the Committee not to relax in their efforts to forward as many free women as possible to this place; and although, with all the circumspection that can be used, some bad characters will undoubtedly get in, yet I feel persuaded that if as many good ones as the David Scott brought can be found for each ship, the benefit will far outweigh the evil: and I have been long enough here to be satisfied that he who is most instrumental in sending free women of all classes to this colony, will best deserve the thanks not only of the present inhabitants, but, in a tenfold degree, will acquire the blessings of generations yet to be born in New South Wales.

"I should be wanting in justice if I were to close this without expressing to the Committee how much I am indebted to Mr. William Gilmore, the purser of the ship David Scott, for the good example which he set to older men, and for the readiness with which he did every thing in his power to contribute to the welfare and comfort of the respectable and well-disposed of the passengers."

The recommendations of Lieut. Marshall are well deserving of consideration by the Committee, who, there is no doubt, will endeavour to put the emigration business on the best footing. The names of Mr. Foster, Mr. Lushington, the Member for Ashburton, Sir Edward Parry, and the other gentlemen on the Committee, are a guarantee for these recommendations being attended to. There is one observation, however, which particularly requires consideration, and that is, that "the captain and mates should be put under proper bond to render the superintendent every necessary assistance for the suppression of vice and irregularity."

Such are the principal contents of the report of the superintendent of this emigration ship, and, upon the whole, it must be considered satisfactory to the friends of the young women who sailed from England in her.

**FERTILITY OF AFRICA.**—Sir Grenville Temple states that while halting near Bysacium, in the territory of the Bey of Tunis, to refresh his horses in a field of barley, he counted one plant of that grain with 97 shoots or stalks. But this is far short of what Pliny states of the produce of the same corn, of which a plant was sent to Augustus, containing nearly 400 stalks, and another to the Emperor Nero with 340. To prevent the seed falling too thickly the Arabs mix it with a quantity of sand.

## WORKING OF THE NEW POOR LAW ACT.

The following petition was a short time ago circulated for signature amongst the leading authorities of the town of Potton, in Bedfordshire, and after having obtained the signature of a number of the shopkeepers and smaller rate payers, in addition to the parish officers, was transmitted to the Poor Law Commissioners. The immediate answer of the Commissioners is subjoined.

"To the Honourable the Poor Law Commissioners. The humble petition of the inhabitants of the parish of Potton.

"Showeth,—That your petitioners having received the rules of the union of certain parishes called the Biggleswade Union, observe with dismay that the said union, as now set forth, includes numbers of parishes which are accustomed to attend the parish of Potton for the purchase of goods and provisions of all sorts.

"That your petitioners have heard with regret that all the parishes named in the list, called the Biggleswade Union, are to be provided for at Biggleswade, and that such provisions are to be obtained at Biggleswade, which will *greatly injure and oppress* the present trade of Potton.

"That your petitioners respectfully represent to your consideration, that the parish of Potton contains a commodious house for the reception of the poor, and three roods of grounds adjoining, which will allow of a great addition to the present one, and also another house capable of holding several persons belonging to the parish, for the use of the poor.

"That the inhabitants of the following parishes are contiguous to and generally trade with the parish of Potton, that is to say, Cockayne, Hatley, Eyeworth, Everton, Sandy, Sutton, Tempsford, Wrestlingworth, and Duntun.

"That by taking the said trade from the parish of Potton it will greatly reduce the *consumption and profit of the present tradesmen and inhabitants, which they feel themselves* justified in representing to your due consideration.

"Your petitioners therefore most respectfully request that the above named parishes be united to Potton, instead of being forced to join the union called the Biggleswade Union, or else be permitted to manage their own poor without loss to the trade of the town of Potton, or how otherwise as you shall deem fit.

—  
"Poor Law Commission Office, Somerset House,  
3rd April, 1835.

"Sir,—The Poor Law Commissioners for England and Wales have to acknowledge the receipt of your letter of the 1st instant, together with the accompanying petition from the parish of Potton.

"In answer to the statements of the petitioners, the Board wish to observe that the main object of the poor law amendment act which they are to administer, is to cause proper relief to be provided for the indigent; and it will be the duty of the Board, in the formation of unions, to take care that such relief shall be provided at the lowest cost to the rate-payers. In the exercise of their other functions the Board will look solely to the general improvement of the administration of relief, and cannot act with a view to the profit of any particular class.

"With respect to that part of your memorial in which you state that you 'have heard with regret that all the parishes named in the list called the

Biggleswade Union are to be provided for at Biggleswade, and that such provisions are to be obtained at Biggleswade, which will greatly injure and oppress the present trade of Potton,' the Commissioners wish to assure you that no such arrangement has been made in favour of the tradesmen of Biggleswade.

"The Commissioners have further to observe that it is their intention, in the performance of their duty of reducing the burdens of the rate-payers, and improving the condition of the poor, to require that all quantities of goods consumed by the indigent shall be purchased by contract on open tender. If, therefore, the tradesmen of Potton are enabled to supply goods for the use of the paupers of the Biggleswade Union, at a cheaper rate than the tradesmen of Biggleswade or any other place, it will be the duty of the Board of Guardians at Biggleswade to act upon the tender of the tradesmen of Potton.

"With reference to that part of your memorial in which you state 'that the parish of Potton contains a commodious house for the reception of the poor, and three roods of ground adjoining, which will allow of a great addition to the present one; and also another house capable of holding several persons belonging to the parish, for the use of the poor,' the Commissioners wish to state that those advantages will be still available to your parish in common with the other parishes comprehended in the union.

"The Commissioners lament that the abusive modes of administration which have spread pauperism, discontent, and immorality amongst the labouring classes, often for the profit of a few at the expense of the great body of rate-payers and of the community at large, should have prevailed to the extent of implanting the notion set forth by the petitioners, that a profit derivable from the relief of the indigent is the privilege of any class in any place, and that the relief might properly be governed with a view to maintain or enhance such profit.

"By order of the Board,  
"E. CHADWICK, Secretary."

## AGRICULTURE IN PORTUGAL.

LISBON, APRIL 18.—It has been reported that large sums from England have been sent to Lisbon for the purpose of speculation in the purchase of national property. I shall endeavour to give you an outline of the nature of these properties and the terms on which the Government propose to dispose of them.

There are 714 convents of friars suppressed, and the whole of their lands and houses are confiscated. In round numbers these convents were in possession of a million of acres of the best lands in Portugal, which are situated on all the rivers, with the advantage also of the best springs of water, fine aspects, woods of the largest growth of timber, cork, and fruits of every kind; and in addition large tracks of mountain, &c., with unlimited right of common for sheep-walks, at present of little or no use, as sheep-farming is little known in this kingdom: and although the Merino sheep are common in Portugal, yet for want of selection and care, both in wool and carcase, they are very inferior, and wool is never sold for more than sixpence the pound. By proper management immense quantities of wool of the finest quality might be raised, and the sheep made available for producing a large quantity of barley, which is the only grain used here for horses, mules, &c., and

of which at present a large quantity is imported. Barley sells at present at 30s per quarter in Lisbon. The quantity of wheat imported is immense, and now sells at upwards of 60s the quarter. For Portugal to grow her own wheat would require the cultivation of 50,000 acres, in addition to the wheat cultivated at present. It is highly probable that, even supposing the extraordinary prejudice which exists in Portugal against the profession of an *agriculturist* could be removed, it would be an age before the country could produce grain for her own population, without the aid of foreign farmers and foreign capital. No British farmer has ever yet made the attempt on the British system. Some few foreigners have attempted to cultivate lands on the Portuguese system, which is known to be the worst in Europe, but have not succeeded. I may, however, safely say that any man who may purchase one of these estates, and tenant it with industrious *British farmers and labourers*, on the *British system*, would meet with every degree of success he could desire. The only estates that have yet been sold have not exceed 5½ an acre, including buildings, timber, fruit-trees—as orange, lemon, fig, olive, vine, &c., which alone will pay 5 per cent. on the capital of the purchase-money. This is accounted for upon the principle of the population being so small in proportion to the quantity of land, and money being successfully employed in other pursuits more suitable to the taste and genius of the people. All the native farmers have as much land as they can cultivate. It is evident, therefore, that any immediate augmentation must be by the introduction of foreigners. The terms proposed by the Cortes are very liberal—viz., to pay down 20 per cent; the remainder to be paid in sixteen annual payments, subject to 2 per cent. on the balance in hand until the whole is paid up. At present there is no tax or tithe on the land or fruit of any kind. The price of labour, both of men and oxen, is very light. Men can be hired in harvest at from 1s to 1s 6d a day, no food; a pair of oxen to plough or lead manure, about 5s a day. The prices of produce vary little, and are now as follow:—beef and pork, 5d per lb; mutton, 4d; veal, 6d; fowls, 2s 6d; ducks, 3s per couple; turkeys, 4s to 8s; geese, 4s to 6s each; pigeons, 6s per dozen; potatoes average 8d per peck; at present they are 1s; turnips, in Lisbon, 1s the peck—in the country seldom to be got, or vegetables of any kind, though much in demand.

## THE SHEEP.—SPECIES AND VARIETIES.

FROM "LOW'S ELEMENTS OF AGRICULTURE."

The origin of the domestic sheep has been sought for by agriculturists in various wild races:—

1. *Ovis musmon*.—The Musmon.
2. *Ovis ammon*.—The Argali.
3. *Ovis tragelaphus*.—The Bearded Sheep of Africa.

The Musmon of the Mediterranean islands is yet found wild in Corsica and Sardinia, in the mountains of European Turkey, in Crete and other islands of the Archipelago. It does not differ greatly in its characters, but it differs widely in its habits, from the domestic races of Europe.

The Argali or Wild Sheep of Asia, inhabits the mountains of Central Asia, and the elevated plains of Siberia northwards of Kamchatka. It has horns of great length; its colour is gray, and it is covered with wool beneath a close hair.

The Bearded Sheep of Africa is found in Barbary and the mountainous parts of Egypt. A variety introduced into East Friesland, and crossed by the common breed, is said to have produced the large prolific sheep of the Texel.

To these wild races might be added *Oris Montana*, the Rocky-mountain Sheep of America, an animal of great size, and inhabiting the mountainous parts of North America. But it is believed that the Rocky-mountain sheep of America is the same as the argali of Asia.

These are the wild animals of the race of sheep that have been yet discovered. Which of them, if any, has given rise to the domestic races has been matter of dispute. In different countries different kinds of sheep are domesticated, and may have been derived from the wild races in the countries where they are found, and in some cases produced by intermixtures which cannot be traced.

The domestic sheep of Europe is usually termed *Oris aries*. The female goes with young twenty-one weeks, and generally brings forth her young in spring. She produces one, and often two, but rarely more than two, at a birth. She yields milk in quantity sufficient to nourish her young. Her milk produces little cream; but the quantity of caseous matter which it yields is comparatively large. This, when made into cheese, is wholesome, but strong-tasted.

The sheep appears to attain his most perfect state as to size and form in the temperate zone. He is there covered with wool, whereas in warmer countries he is more covered with hair, as he also partially is in the colder countries, where his size is likewise diminutive. The wool of the sheep falls off and is renewed every year; and the period of its falling off is early in summer.

In its natural state the sheep has horns; but in the domesticated races the horns frequently disappear, and the most valued breeds of them are entirely destitute of them. The sheep is a very hardy creature, with regard to the effects of temperature, its thick coat of wool defending it well from cold and moisture. It has been known to live for a long time under snow. It is a harmless and timid creature, and in its domesticated state is dependent upon man for protection and food. In mountainous countries, however, where it is less domesticated, and must trust greatly to its own resources, it manifests its instinctive powers of self-protection. It scratches up the snow with its feet in search of food: it is conscious of an impending storm, and takes the means to secure itself from its violence: it is wary and vigilant, and numbers have been known to combine for defence against beasts of prey. But though, under these circumstances vigilant, and in cases of necessity bold, all the habits of this creature lead it to submit to the dominion of man, and from the earliest times, accordingly, it has been the subservient instrument of our race.

Whether the wild race of sheep be all of one species, as some naturalists suppose, or of different species, as others maintain, the domestic races with which we are familiar in this island are believed to be of one species; and what we term breeds are merely varieties produced by different conditions of situation, food, and culture.

These conditions, however, produce a great diversity in the size, characters, and economical uses of the animal. Judging from general aspect only, we might believe that the diminutive creature of the Zetland islands, of the size of a little dog, is a distinct species from the large sheep of the Romney marsh; yet the species are believed to be the same.

The sheep, like the other animals necessary for human support, is fitted to adapt himself to the physical circumstances with which he is surrounded. In a country of heaths and scanty herbage, he is small, agile, and hardy. In a country of plains and rich herbage, he becomes of great size, unfitted for active motion, and less capable of providing for his own wants.

In the British islands, attention has long been paid to the culture of the sheep. In many parts it remains almost in its natural state; but in others it has been brought to all the perfection with respect to form, early maturity, and disposition to feed, which appears to consist with the nature of the animal.

Besides the properties of size and form, sheep are distinguished from each other by the nature of their wool. Sometimes it is short and fine, and fitted for the making of cloths; and sometimes it is long, and suited to the making of worsteds and coarser fabrics.

The main divisions of what are termed breeds in this country are into the sheep of the mountains, lower moors, and downs,—and the sheep of the richer plains. The varieties of the former class have sometimes horns, and are sometimes destitute of horns; they have sometimes short wool and sometimes long wool: the true sheep of the plains are all destitute of horns, and have long wool. The following may be enumerated as the principal breeds of this country:—

1. The Zetland Sheep.
2. The Dun-woolled Sheep.
3. The Black-faced Heath Sheep.
4. The Moorland Sheep of Devonshire.
5. The Cheviot Sheep.
6. The Horned varieties of Fine-woolled Sheep of Norfolk, Wiltshire, and Dorset.
7. The Ryland Sheep.
8. The Southdown Sheep.
9. The Merino Sheep.
10. The Devonshire Notts, the Romney-marsh Sheep, the old Lincolnshire, Tees-water, and Old Leicester.
11. The New Leicester, and improved Teeswater Sheep.

The Zetland sheep exist in the islands whence they take their name, but with some change of characters, extend to the Faroe islands and the remoter Hebrides. They are the least of all our races of sheep. They are generally without horns. The wool is adapted to the making of the finest fabrics, and forms a fine fur. Mixed with the wool, however, is a coat of coarse hair, which, when the wool falls off, forms a covering to the animal. The like character is possessed by some other sheep in the extreme north of Europe; and it is probable that it is from this source that the fine-woolled sheep of the remoter Highlands has been derived. These little creatures are very hardy, and may be suited to the scanty pastures where they are reared, but they are not deserving of more extended cultivation.

The Dun-woolled variety of sheep seems to have been once very generally extended. There is more or less of a dun colour of the wool, sometimes on the face or legs, and sometimes in patches on the body. Remnants of this original race are yet found in Scotland, in Wales, and in the Isle of Man. A similar breed extends to Normandy and other parts of Europe. The wool is soft and fine, and the mutation good; but in other respects the breed does not deserve cultivation.

The Black-faced Heath sheep are the natural inhabitants of a country of mountains and heaths,

Their wool, though shaggy and coarse, is light, weighing from 3 to 4 lb. the fleece. They are of the smaller class, but they are the hardiest, boldest, and most active of all our sheep; they have horns, and their legs and faces are black; they feed readily when brought to good pastures, and their mutton is in great esteem.

This race of mountain sheep is found on the highlands of Yorkshire, on the mountains of Cumberland and Westmorland, on the mountains in the south of Scotland, in Argyllshire, and all northward through the western and central Highlands. The best examples of the breed are usually found in Tweeddale and the adjacent districts.

For an elevated and rugged country, where the chief pasturage is heath, this breed is exceedingly well suited. The objection to it is the little value of the fleece, which is the coarsest of the wools produced in this country. This circumstance has, in many districts, caused a substitution of the Cheviot for the black-faced breed. But although the Cheviot breed is superior to the black-faced in weight and value of the wool, it is not possessed of the same hardy qualities; and the black-faced may, therefore, be cultivated with advantage in situations to which the Cheviot is unsuited.

The black-faced breed, though well defined, loses many of its characters when naturalized in a low, marshy, or less healthy district. Its wool becomes less coarse; the darkness of its colour diminishes; its legs and face becomes spotted or gray; and its horns sometimes disappear. Hence this breed is in some places so changed in its external characters, as to have lost much of its resemblance to the parent stock.

The Moeland sheep of Devonshire, termed the Exmoor and Dartmoor, derive their names from the districts of Devonshire where they are found. They have horns, white legs and faces, and long wool; they are hardy, and supposed to be suited to the wet undrained country which they inhabit: their wool weighs about 4 lb. the fleece: they are of the smaller class of sheep, and their form is bad.

The next mountain breed to be mentioned possesses very distinct characters. This is the Cheviot, so termed from being reared on the mountains round Cheviot, whence it has been very widely extended to other elevated districts.

The Cheviot sheep are heavier than the black-faced; they are without horns; the wool is fine, and the weight of the fleece is about 3 lb. and upwards. The sheep, like those of other mountain breeds, are light in the fore-quarters. They are hardy, active, and well suited to an elevated country.

The mountains where this race of sheep is indigenous, though high, are mostly covered with a green sward, and thus differ from the heathy mountains of other parts. The nature of this range of pasturage may have contributed to give its peculiar characters to this breed, though it is probable that some cross of which the history is now lost, may have added to the effect. The Cheviot sheep have been greatly improved, but the breeders having directed attention more to the form and size of the animals than to the quantity of wool, the latter has diminished in fineness, though it has increased in quantity.

The properties to be desired in a mountain breed are, that it shall be hardy, of good form, of sufficient size, and with good wool; and, for a combination of these qualities, the mountain breed of the Cheviots has not been equalled in this island.

The horned varieties of fine-woolled sheep, though reared in a comparatively low country, are allied to the sheep of the mountains, lower moors, and downs.

Of this class of breeds the Norfolk prevails in the counties of Norfolk and Suffolk. The sheep of this breed have large spiral horns and short wool. They differ from the black-faced heath sheep and the moorland sheep of Devonshire, in having short wool, and from the Cheviot, in having horns. They are tolerably suited to the dry pastures where they are chiefly found, but they are of a bad form, having thin bodies and flat ribs: they are of about the same weight as the Cheviots, and the wool is about 2 lbs. the fleece: they are of a restless disposition, and are considered to be slow feeders: they are generally giving place to the Southdown, which are in all respects a superior breed.

The Wiltshire sheep are distinguished by large spiral horns, but the legs and faces are white, and they are heavier than the Norfolk. Their wool is fine, weighing about 2½ lb. the fleece, and they are the largest of our fine-woolled sheep. The county of Wilts, where they are naturalized, consists in a great part of downs, and this breed was regarded as hardy, and well suited to the nature of the pastures; but it has been gradually giving place to the Southdown.

The sheep of the Dorset breed have small horns, with white legs and faces. Their wool is heavier and less fine than that of the Wiltshire sheep, weighing from 3 to 4 lb. the fleece, and more. They are a hardy race of sheep, being chiefly bred on the open downs of this part of England. They are remarkable for the ewes admitting the rams at an earlier period than any other sheep, and on this account they are valued for producing lambs for winter consumption.

The Ryland breed is so named from a district in Herefordshire. The sheep are very small, white-faced, and without horns. The wool is very fine, weighing about 2 lb. the fleece; the ewes, when fat, weigh from 12 lb. to 14 lb.; and the wethers from 12 lb. to 16 lb. the quarter; their flesh is delicate, and they may be said to be suited to the stunted pastures on which they are reared.

This breed has been crossed with the Spanish Merino, and the produce brought into extensive notice under the name of Merino-Ryland, or Anglo-Merino. Great exertions were made to extend this cross; but though it produced good wool, it has altogether declined in favour. There are other breeds allied to the Ryland, which, like it, have fine wool, and are bred on soils yielding light herbage.

The Southdown is a breed of fine-woolled sheep, now greatly esteemed, and extensively diffused on the light soils and chalky downs of England. They are without horns; their legs and faces are gray, and, like the sheep of the mountains, they are light in their fore-quarters. Their wool is fine and short, being from 2 to 3 inches in length, and weighing, on an average, about 2½ lb. the fleece. Their flesh is of excellent flavour; they are a hardy class of sheep, kindly feeders, and well suited to the species of pasture on which they are chiefly reared; they are about the size of the Cheviot sheep, the wethers, when fat, weighing about 18 lb. the quarter.

These sheep have been reared from time immemorial upon the chalky soils of Sussex; they have spread into other districts of light soils and downs, and also into some to which they are not well adapted.

Much care has been bestowed on the cultivation of this breed, and it has accordingly been greatly improved; but attention having been mainly directed to the form and fattening properties of the animals, the quality of the wool has declined, though its quantity has increased.

In the class of fine-woolled sheep is the Merino or Spanish breed, now partially naturalized. They are originally natives of the northern provinces of Spain,

and were introduced into this country in the year 1788. In the year 1792, the rams were made to cross the Ryeland, the Southdown, and other fine-woolled breeds of England. His Majesty King George III. had introduced rams of the Merino breed from Spain, and cultivated it with care. In the year 1804, the sales which then began of his Majesty's stock attracted great attention to the breed; and, in the year 1811, a society was formed for the purpose of encouraging and extending it.

The result of the crosses with the native sheep has not in any degree fulfilled the expectations formed. The wool of the native sheep has indeed been improved in quality; but this has been accompanied by defects in the characters of the animals themselves not to be compensated by the increased value of the fleece. The sheep of the mixed breed have nearly all proved defective in their forms, slow feeders, and less hardy than the parent stock.

Flocks, however, of the pure Merinos have been preserved, and the progeny of these has remained superior to the new or cross-breeds. The naturalized Merinos retain their natural characters, though the wool becomes longer and heavier than in Spain, and the body more large. But the entire form of the Merino as a feeding animal is bad, the animal small, and the return in mutton deficient both in quantity and value. It is vain that some breeders still contend for the superiority of the pure Merinos; the general judgment of farmers is against them, and with perfect reason.

Could the breeders of this country look more to the fleece than the weight and value of the animal, as in Spain and the parts of Germany where the Merinos have been naturalized, the culture of the breed might become profitable. But the breeder in England finds it his interest to direct attention mainly to the weight and value of the flesh; and while this is so, it will be more advantageous that this country import the wool of other countries than that the feeders either adopt an inferior animal, like the Merino, or sacrifice the more essential properties of the native sheep.

The races of sheep that have been mentioned may be said to be proper to mountains, lower moors, and chalky downs. The sheep of the lower plains are of a larger size, and more productive of flesh and wool, and they are all, it has been said, destitute of horns.

The first of these breeds to be mentioned is the Devonshire Notts, of which there are two varieties. The first, the Dunfaced Nott, so named from the brown colour of its face, is a coarse animal, with crooked back and flat sides: it bears a fleece of 10lb of wool, and is supposed to average, when fat, at 30 months old, about 22lb or more the quarter. The other variety is the Brampton Nott, which has a white face and legs, but in other respects resembles that last mentioned, producing, however, less wool and being a better feeder. Both of these clumsy breeds have been improved by crosses with the New Leicester.

The Romney-marsh breed has existed from time immemorial in the tract of rich grazing land on the southern coast of the counties of Kent and Sussex. The sheep of this breed are very large, have white faces, and yield a heavy fleece of long wool of good-quality of its kind. These sheep are favourites with the London butchers; but their breast is narrow, their extremities coarse, and in other respects their form is defective. They have been crossed by the New Leicester, which has had the effect of diminishing their size and lessening the quantity of their wool, but of improving their general form, and giving them a better disposition to fatten. Some

breeders of experience, however, question the good effects of this cross, maintaining that, besides the decrease of weight and deterioration of the fleece, the cross is less suited to the cold and open pastures of the marsh.

The Old Lincolnshire sheep, where they yet exist without intermixture, are a large coarse class of sheep, with hollow backs, flat ribs, and a hanging belly. They are slow feeders, and their mutton is not esteemed. But they yield a very heavy fleece of long wool.

The Teeswater breed was formerly the stock of the part of England near the river Tees. It is now, however, so entirely changed by crossing with the Dishley breed, that the old unimproved race of the Tees is scarcely now to be found. They were a very large race of sheep, arriving at the greatest weight of any other breed, and, like all the large kinds, being very prolific of lambs. The wool they produced was long and heavy to the fleece.

The old Leicester is a variety of the coarse long-woolled breeds which still exist in several of the midland counties. The sheep of this variety feed to a great weight on rich pastures, but they are coarse slow-feeding animals, and have generally either given place to improved kinds, or had their own characters changed by crossing.

The improved Dishley breed is very generally termed the New Leicester, from having been formed by Mr. Bakewell of Dishley, in the county of Leicester. This gentleman was the son of a considerable farmer; and, about the year 1755, had begun to turn his attention to those improvements in the form of feeding animals, by which he became so distinguished. The precise steps which he followed in the forming of his breed of sheep are not known, as he chose to observe a species of mystery upon the subject. He is supposed to have derived his first sheep from Lincolnshire; but however this may be, it was by a steady breeding from the best-formed animals, until the properties aimed at had been acquired, that he gradually corrected the defects, and improved the form of the animals. He was well aware of the external characters which indicate a disposition to feed, and, by a steady course of selection continued during a lifetime, he obtained animals of superior feeding properties to any that had been before cultivated. By constantly breeding, too, from individuals of his own flock, and consequently near of blood to each other, he gave a permanence to the characters of his breed which it retains to the present hour. Mr. Bakewell adopted the practice of letting out his rams for the season, and this contributed to the general diffusion of his breed. Successors to Mr. Bakewell have continued the same system, and bestowed the utmost care in maintaining the purity of their flocks; and thus from the county of Leicester as a centre, this breed has been spread to every part of England, where the breeders have thought fit to receive it; and it has entirely changed the character of the greater part of the long-woolled breeds of this kingdom.

The sheep of the new Leicester breed are inferior in size to the other varieties which they have supplanted. The wool is but of moderate quality, and in weight it falls short of that of the larger breeds; it weighs from 7 to 8lb and has a length of pile of from 5 to 7 inches. The value of the breed, therefore, does not consist in the size of the individuals, or the quality or abundance of their wool, but in early maturity, and aptitude to feed. In this latter property, the New Leicester has not been surpassed or equalled by any other breed of cultivated sheep.

The improved Teeswater is derived from the old

breed of the Tees. The sheep are smaller than those of the older race, but still they are a weighty class of sheep. They are the largest of all the improved breeds, yield a good fleece, and, like the breed from which they are derived, are very productive of lambs. The Teeswater breed owes its improvement chiefly to crossing with the new Leicester: but the same long-continued care has not been bestowed upon it as upon the other, and therefore, although feeding to a greater weight, the animals are not so complete in their form, nor so well adapted for general cultivation, as the improved Leicester.

The breeds of sheep, then, of this country, may be divided into two classes,—the sheep of the mountains, lower moors, and downs,—and the sheep of the plains.

The sheep of the first class have sometimes horns and sometimes want horns. The finest of them have no horns, namely, the Cheviot and the South Down. One of them, the blackfaced heath breed, has coarse wool: one of them, the moorland sheep of Devonshire, has long but not coarse wool; and all the others have short and fine wool.

Of the moorland and down breeds, as they may be called, the hardiest is the black-faced heath breed, and this property points it out as the most suitable for a high and rugged country, where artificial food cannot be procured.

The breed next to this in hardy properties, but surpassing it in the weight of the individuals, is the Cheviot. Where the pasture contains a sufficiency of grasses, this breed deserves the preference over any other known to us for a mountainous country.

The next breed deserving of cultivation is the Southdown. This breed is suited to the chalky and sandy downs of the south of England. It is in this respect a very valuable breed, but it is unsuited to the more rough and elevated pastures, to which the black-faced and Cheviot are adapted.

These are the moorland and down breeds, which appear to be the most deserving of cultivation in this country. Of the larger breeds of the plains, the New Leicester is the best adapted to general cultivation; and wherever an improved system of tillage is established, this admirable breed may be introduced.

## THE LARGE FLOWERING SENSITIVE PLANT.

This splendid shrub grows wild, both in the East and West Indies. It is frequently found in the mountains of Jamaica, and was introduced into our gardens in 1769, by Mr. Norman. It belongs to the same tribe as the common sensitive plant, but does not possess the power of closing its leaves at the approach of danger, in nearly so high a degree as its less-splendid companion. We must all have noticed the folding back of the leaves, and the rolling up of the flowers, of many well-known plants, in the evening, or at the approach of rain, and their subsequent expansion in the morning, or after the passing by of the shower. But the sensitive plants include within themselves, a power of motion far exceeding this, and approaching, in appearance, the voluntary movements of an animal. The origin of this singular power has never yet been discovered, although numerous experiments have been made, to ascertain the fact. These experiments all tend to demonstrate the infinite variety of ways, in which the Creator of all things has furnished every object of his creation with the means of self preservation.

We have already alluded to the periodical closing of the leaves of plants: the same motion takes place in the sensitive plants, but the wonderful fact in the history of the latter is, that this movement can be produced at any time; and by merely touching the leaves gently, they will instantly recoil, and fold themselves together, as if for self-protection; and at the same time, the small twig which sustains the leaves, approaches the main stem. If the touch has been forcible, not only the twig supporting one series of leaves is affected, but the same effects take place in the compound leaf, on the opposite side of the stem, and this motion is sometimes communicated to the whole plant.

It is very difficult to touch the leaf of a healthy sensitive plant so lightly as not to make it close: after the leaves are closed, some time elapses before they regain their original position, and the duration of this interval depends on the time of day, the season of the year, and the more or less healthy state of the plant. It seems, however, that light is an agent necessary to the production of some of these movements.

In the month of August, a sensitive plant was carried in a pot from its usual situation, into a dark cave; the motion it received in carriage, caused it to close its leaves, and they did not open until four-and-twenty hours afterwards: by this time they had become moderately open, but were afterwards subject to no changes at night or morning, remaining three days and nights with their leaves in the same state. At the end of this time it was brought out again into the air, where the leaves recovered their natural periodical motions, shutting every night, and opening every morning, as naturally and strongly as ever: but although while in the cave, their periodical motions were suspended, they shrunk from the touch with almost as much power as when in the open air.

Although a sensitive plant is, as we have seen, easily affected by the slightest touch, and closes when subjected to a heavy fall of rain, it remains unmoved if only exposed to a gentle shower. If the leaves are touched with sufficient force, the branches are also affected, but it is possible, if the experiment is carefully performed, to cause the branch to move towards the stem, the leaves still remaining in their original position with reference to each other; thus proving, that the power of motion belonging to each part of the plant is independent of that possessed by any other part.

The same species of irritability has also been noticed in many other plants; one instance occurs in the flower of the common barberry. The experiment was made on a bush in full flower (it was about one o'clock, the day was bright and warm, with very little wind,) and is thus related by Dr. Smith.

"The stamina of such of the flowers as were open were bent backwards to each petal, and sheltered themselves under their concave tips. No shaking of the branch appeared to have any effect upon them. With a very small bit of stick I gently touched the inside of one of the filaments, which instantly sprung from the petal with considerable force, striking its anthera against the stigma. I repeated the experiment a great number of times in each flower, touching one filament after another, until the tips of all six were brought together in the centre over the stigma.

"I took home with me three branches laden with flowers, and placed them in a jar of water, and in the evening tried the experiment on some

of these flowers, then standing in my room, with the same success.

"This irritable power appears, however, to reside only in the inside of the filament, as when touched in any other part it remained unmoved."

## ON THE DANGER OF BLEEDING, AND THE ADVANTAGE OF ADMINISTERING EMETIC TARTAR IN STAGGERS (VERTIGO) IN THE HORSE.

By M. PHILIPPE, M.V., MILITAIRE.

(From the Veterinarian.)

The frequent occurrence of vertigo (stagers) in the horse, and (whether from the serious character of the disease, or the nature of the treatment which is employed, or the difference of opinion which exists as to what that treatment ought to be) the frequency with which it bids defiance to all the resources of art, induce me to relate some facts that have occurred in my practice.

At the commencement of my career, fully imbued with the doctrines which I had learned in the schools, I employed venesection, emetic tartar and aloes, setons or vesicatories, and lotions of cold water on the head. From the absolute failure of success in the cases in which I had seen this mode of treatment adopted, I ought to have foreseen that such means could have little good effect; but, seduced by the brilliant illusions of theory, I persisted in the employment of them, and in the space of ten years I thus treated twenty-three horses, twenty of which died, and the three others remained in a comatose, debilitated state, to which farcy or glanders soon succeeded.

It was not until 1833 that I changed my plan of treatment. A mare named La Fortune, belonging to the 11th regiment of artillery, eight years old, and exceedingly fat, was, on the 13th of May, attacked with vertigo. She was continually in motion, knocking and pressing her head forcibly against the wall, and had thus already wounded her head in various places. She was led with difficulty to the infirmary, which was only a little way from the place in which she had been standing. The pulse was full, hard, and slow—the conjunctiva highly injected—the pupils dilated—the dorso-lumbar portion of the spine inflexible, and she was perfectly unconscious of surrounding objects. I was about to bleed her, when, reflecting upon my former experience of the inadequacy of this measure, I determined to adopt other means. A few days before I had been talking of this disease with my intimate and valued friend M. Crepin, and he had informed me of the success which had attended his adoption of the plan first recommended by M. Gilbert—abstaining from bleeding, and giving emetic tartar. Encouraged by his advice, I gave La Fortune an ounce of emetic dissolved in a pound and a half of the infusion of the flowers of the Linden tree. After having cast the animal, and inserted a seton on each side of the chest, and injection of an ounce and a half of aloes was thrown up, and the animal was restricted to water whitened with oatmeal. After that, an ounce of the sulphate of soda was administered daily, and some injections given, and the animal, to my great surprise, was completely well in the space of fifteen days. She was then sent to grass, and in a little while fully regained her condition. Four days afterwards she was taken up, and put violently on dry food, and on the 6th day fresh symptoms of vertigo appeared. I employed the same means, with the exception of the setons, and with

the same success. She is now at hard work, and in perfect health.

Two other cases of vertigo presented themselves in the months of March and April, 1834, and in both of which it would have been thought that bleeding was plainly indicated. Both the horses were very fat—there was great redness of the mucous membranes—fulness, frequency, and hardness of pulse—dilatation of the pupil—all the intellectual functions suspended or confused—the power of motion disordered—it seemed like a state of drunkenness: they pressed their heads against the wall, and, in fact, exhibited all the symptoms of well characterized vertigo.

As soon as I saw them I ordered them to be cast, and inserted setons on each side of the chest. I then administered an ounce of emetic tartar in a pound and a half of hot water. On being liberated and led to their stalls, an injection containing an ounce and a half of aloes was administered to each. The restricted diet of white water was ordered for each, with an ounce of the sulphate of soda daily. Success crowned my efforts, although in July one of them had an appearance of farcy in the course of the seton; and they now are free from every symptom of a disease which I regarded as mortal, and, at least, in which I had previously been unable to render any service.—*Journal, Feb. 1835.*

IMPORTANT DECISION TO AGRICULTURISTS.—It will be recollected that at the last Assizes for Bedfordshire, in the action "Palmer v. Armstrong," a nominal verdict was taken for the plaintiff for the sum of 1,000*l.*, and the case referred to an arbitrator, F. Pym, Esq., who accepted that office. The case has since been discussed. Messrs. Pearce and Sons, for the plaintiff; and Mr. Sharman, for the defendant.—It appeared that defendant occupied a farm in Goldington, and that the action was commenced against him by Mr. John Palmer, his landlord, for damages on account of dilapidations and mismanagement of the land. The defendant lately occupied, as yearly tenant, and without any agreement as to cultivation, a farm of the plaintiff's at Goldington. The principal ground of complaint was that the defendant, during the tenancy, had cross-cropped the land, by growing in each year, a certain portion of wheat after barley, and barley after wheat, and that in the last year he had grown too large a quantity of wheat. The course of cropping adopted by the defendant, including to a certain extent the above-mentioned system, was admitted by the defendant; and on behalf of the plaintiff several witnesses were called to give evidence that in their judgment the system was a bad one, and that it was contrary to the custom of many parts of the country. On the part of the defendant it was proved by a very strong body of evidence, including farmers and agricultural labourers, that it has been the custom immemorially for all the farmers in the parish of Goldington, which is an inclosed parish, and farmed upon the three course system, to grow wheat after barley, and *vice versa* to grow barley after wheat, and that the plaintiff himself adopted this plan when he occupied land in the parish. It was also proved that the defendant had farmed the land in all other respects in an excellent manner during his tenancy, and the following farmers, Mr. Bennett, of Beckerings Park; Mr. Lyon, of Elstow; Mr. Clayton, of Cople; Mr. Anderson, of Oakley; and Mr. Stimson, of Marston, gave evidence that they had viewed the farm, and that it was left in a very capital state of cultivation, and that no farm in the parish was in better condition. It was

proved, too, that the farm had been re-let at Michaelmas, 1834, when defendant left it, for precisely the same rent as he gave for it when he entered, at Michaelmas, 1831, and for the three succeeding years, although the price of agricultural produce had in the mean time considerably diminished.—The arbitrator has lately given his award for the defendant, and has adjudged the plaintiff had no cause of action whatever against the defendant, and that the plaintiff shall pay the costs of the reference and award, in addition to the costs of the action.

**HOW TO STOP A STARTLED HORSE.**—Dr. De Chemant has suggested the following means of preventing accidents from high mettled horses:—"The muscular strength of the horse being greater in the flexors than the extensors, a small chain, of about three yards long, covered with leather, and contrived to fall, at pleasure, a few inches below the joint of the knee, would slacken the horse's pace, or stop him at will. To accomplish this, the chain must be fixed to the harness by the two ends, about the middle of the body; and for greater security, a small piece of copper, one or two inches wide, could be placed on that part of the chain which would fall on the horse's knee, so as to embrace the narrow part of the leg, and which would prevent the chain from sliding upwards. When not in use, the chain may be suspended round the neck of the horse, or be attached to the centre of the collar by a small cord which would pass behind the ears, and be fixed on the harness at the top of the head. Then, by means of a spring, made for that purpose, the chain could be let down at the will of the driver, or of those persons inside the carriage. To this invention may be added the following simple means of depriving the horse of his sight in an instant:—A pair of leather winkers, made concave, may be fixed to the harness on the forehead with a spring, and which, on pulling the same cord that lets down the chain, would also close over his eyes."—*Atlas Newspaper*.

**A BRACE OF "FINE OLD COCKS."**—We some months back inserted an account of a hale old man named Hunter, residing at Holbeach, carrying a sack of flour weighing 20 stone, a short distance on the day he attained his eightieth year; we have now to record that Mr. James Oliver, miller and baker, of the same place, reached "fourscore in years" on the 13th inst., in the afternoon of which day he carried across his bakehouse with the greatest ease 20st of flour. Mr. Hunter, who will soon score his "fourscore and one," enjoys at the present time an excellent state of health.—*Lincoln Mercury*.

**SALAD.**—The intercommunity which now subsists between England and that truly "salad-eating nation, France," has been the means of increasing the use of salads so extremely amongst us, that it is now become almost a necessary appendage to the table. Still, however, many persons are disinclined to introduce it not only on account of the trouble of getting together the numerous articles required to make a good salad, but also from the nicety which is requisite in mixing that just proportion of ingredients without which excellence cannot be attained. This difficulty may be altogether removed by using "Batty's Salad Cream," a mixture with which a salad, which will challenge the criticism of the most fastidious gastronomist, it being prepared from a genuine receipt of the celebrated Dr. Kitchener, can be prepared in one minute.

## ON DRILLING CORN, &c.

We earnestly invite the attention of all practical Agriculturists to the "NORFOLK AND IMPROVED LEVER DIBBLE DRILLS," the particulars of which will be found in our Advertising Sheet, as well as to the subjoined explanation of the operation of Drilling.

Nearly every objection against the superiority of drilling over other modes of sowing has been satisfactorily rebutted by the original inventor; any lengthened discussion, therefore, within the limits of this paper, would be as impracticable as it would be unnecessary. Nor is it intended, here, to enforce the row culture in every situation or in every variety of season; the writer's object is simply to recommend its more general adoption, and with this view to show, by statements founded on actual experience, that, in the growth of wheat, barley, beans, and turnips, there would, under favourable circumstances, even at the present extreme low price of corn, be a saving in the first expense, and often a more abundant crop afterwards.

Corn and other crops, no matter how they have been sown, are frequently overgrown with weeds, which, if not destroyed, must take that nourishment from the soil which is required for the corn; now, to effect this, the land must either be hoed or hand-weeded: and it can easily be perceived, that much less damage is done to those crops which have been drilled than those sown broadcast, inasmuch as the workman can use his hoe between the rows with greater ease to himself and far less injury to the plants which have been drilled, than must inevitably be the case where sown broadcast.

In sowing any sort of seed, these four circumstances must be carefully attended to. For want of heat, seeds will not come up during frost; for want of air, they will not come up if too deep in the ground; and, if not duly covered, they will not come up from having too much light. A few will germinate in the light. It is of the utmost importance, therefore, to the success of any kind of crop, that the seed be placed at the proper depth in the soil. If it be too thinly covered,—if, like that in the parable of the sower, it have, "not much earth," it will, "when the sun is up, be scorched," and will "wither away because it had not root." If, on the other hand, it be buried too deep, the stem is weakened in its efforts to get through the soil to the light, and even when it gets above ground, it continues slender and does not recover its vigour, which is spent on the production of a second set of root fibres, and as soon as this is effected, the first set dies off.

This, says an able writer, furnishes a good practical lesson to the farmer, never to sow *before* he harrows; or if he drills corn, never to allow the shares to go deeper than one inch into the ground; or, at least, to see that the seed be not covered more than one inch." Now, no method of depositing seed secures these advantages so certainly as drilling.

The principal objection urged against drilling, (and what perhaps will sufficiently account for its being so rarely practised,) is the difficulty of getting it well performed. It is too frequently entrusted to the management of labourers who do not understand the machinery, and who, if any part get out of order, are unable to rectify it on the spot; by proceeding, the work is rendered imperfect, the machine is thrown out of repute,

and thus the real merits of this invention become greatly undervalued. On due care, however, being exercised in selecting a proper person to superintend the execution of the work, the following advantages, compared with other modes of sowing, will be obtained.

#### LIGHT SOILS.

**TURNIPS.**—Drilling for turnips is very much to be preferred, and appears to give general satisfaction, especially in dry summers. In one season, many farmers, by way of experiment, sowed their turnip-seed in two different ways; first, by manuring and sowing broad-cast in the usual manner, and secondly, by drilling the seed with a little moist tillage. Those which were done in the latter manner proved, nine times out of ten, to be by far the best turnips. Drilling hand-tillage (particularly recent and moist manure) directly with the seed is perhaps one of the most important and economical methods that can be adopted for obtaining turnips; and this advantage, combined with the ready convenience of regulating the plants to be left on the ground, entitles the row culture to a decided preference. The seed, as well as the manure, can be deposited at any depth, and less seed will be required than if sown broad-cast; but it is much better to drill too much than too little, since the quantity can only be regulated by the state of the weather.

**BARLEY.**—It is very seldom that the season is so wet as not to admit of barley being drilled after turnips have been eaten off the ground; on this account the row culture should nearly always be adopted for barley. Upon taking an average, for a number of years, of the quantity of seed required for one acre, it is ascertained that four bushels is necessary for broad-cast, whilst three bushels and a half is sufficient for drilling. There is very little difference in the labour of these two methods of sowing barley, for it is quite necessary to harrow the land well in either case; and although the drill requires three horses to draw it, it must be observed that the coulter of it divide and pulverize the soil as much as one harrowing, not to mention the increased facility it affords for weeding, stone-gathering, &c.

**WHEAT (AFTER CLOVER LEY.)**—Drilling wheat after clover ley does not appear to have gained ground, on account of the extra trouble required in sufficiently pulverizing the soil for the use of the common Norfolk drill, but this inconvenience is considerably removed by employing the dibble drill.—The necessary quantity of seed depends both on the time and the state of the weather, and sown early requiring less seed than if sown later. But on an average of a great number of years it has been found to require for broad-cast six strokes and one peck, while drilling needs only five strokes and one peck per acre, making a difference of one stroke.

#### STRONG SOILS.

**WHEAT (AFTER SUMMER FALLOW.)**—Drilling fallow-wheat at Michaelmas with a little hand-tillage, provided the season will permit, is a very economical and advantageous plan, both as it regards the expense of seed and the opportunity afterwards afforded for entirely eradicating all the weeds between the rows either by the horse or hand hoe. The average quantity required to sow one acre broad-cast is six strokes, and five strokes are quite sufficient for Drilling, leaving a saving of one stroke by adopting the latter mode, beside all other advantages.

**BEANS (AFTER WHEAT).**—To show that the Row Culture for beans is thought to answer, we need only mention that several farmers drill beans who do not drill any thing else.—When drilled, from the manner in which the plants grow, (the pods being placed on the stem from the root upwards,) they must of course derive essential benefit, while filling, by the admission of air through the open space left between the rows; for it is well known that beans and all other green crops which carry their seed from the bottom of the stalks to their tops, require to have free access to the atmosphere. The ears of corn, on the other hand, are so placed as to have always accession to the air while they are standing, the stalks being nourished from the ground, and not (like green crops) from the atmosphere. By this mode, moreover, the weeds, in hoeing, are more easily destroyed. The saving of seed is always very considerable, and fully repays for drilling, their being required for broad-cast seven strokes, and for drilling five strokes. But with respect to saving of seed here, and in every other case, it may, perhaps, be safely laid down as a general rule, that seed must be increased in proportion to the poverty of the land, from which cause so many kernels always perish for want of nourishment, whereas in a rich soil nearly every individual seed vegetates.

**WHEAT (AFTER CLOVER LEY.)**—Under proper management, the heaviest crops of wheat are generally obtained from clover leys. This points out the necessity of adopting the best and easiest mode of sowing. Until the dibble drill was invented, it was impossible to drill wheat upon strong land clover leys. To reduce a strong soil to the requisite degree of fineness, would require much additional labour, and is at the same time impracticable in unfavourable seasons; for while this labour is going forward, or perhaps nearly completed, and the soil ready for the seed, the fall of a few hours' rain would, by again rendering the surface adhesive and lumpy, make all this labour useless. The change of weather that often takes place in October and November supplies a further reason for adopting the dibble drill; at this season it is not a matter of choice, *but of necessity*, to put in the wheat with the least possible delay. The saving of seed and the advantage of depositing it at one certain depth are the same here as mentioned under the head of Wheat after Clover Ley on "LIGHT SOILS."

Having shown above under what circumstances the row culture may be carried on to the farmer's benefit, it now remains to give a brief description of two of the most improved drills, as being best adapted to ensure those advantages which may be derived from this mode of sowing when properly managed.

#### THE NORFOLK OR IMPROVED LEVER DRILL.

This drill, which requires three horses to draw it, is found equally applicable to light and strong soils, provided they can be made friable to the depth of three or four inches; and where lands or ridges are 4 or 4½ yards wide, it is so contrived that *the horses may always walk in the furrow without setting a foot on the land*,—a circumstance which is very advantageous in wet seasons. It will drill about twelve acres a-day of any required quantity of wheat, barley, beans, and turnip-seed per acre, at any depth, and the rows at any distance from each other.—By employing this drill to deposit hand-tillage along with the seed, the use of manures is economized in a two-fold degree; it

diminishes the quantity necessary, and increases its power by bringing it into immediate contact. The charge for the use of this drill and a man to conduct it, is 1s 6d per acre when seed only is drilled, and 2s when tillage is required to be deposited with the seed.

#### DIBBLE DRILL FOR WHEAT OR BEANS ON THE SOLID FURROW OF GRASS OR CLOVER LEY.

This drill, on a simple and small scale, was invented by Mr. J. S. Bayldon, about the year 1820, was improved, enlarged, and put on the lever principle eight years ago, and has been used with uniform success every season since. It is found to answer both on light and strong heavy soils, and is of sufficient breadth to sow a 4 or 4½ yard land at two movements. Any quantity of hand tillage may be deposited with the seed if necessary. It is capable of being used in any season that is fit for broad-cast, and is recommended as a substitute for dibbling, being performed much quicker, and the seed sown more regularly, than is done by children, who very often drop twice the quantity of seed in one hole than they do in another. Indeed it combines all the advantages of the dibble and the pressing-machine, while it is free from many of their defects, and is also performed in considerably less time, being capable of sowing nine acres per day. Dibbling requires a great number of hands to get the seed sown in proper season; and in tenacious soils it is very objectionable, inasmuch as the dibble forms a cup for the water, in which the seed may perish. On the contrary, the cutters or pressers of this drill make a continued narrow niche on the solid furrow, the seed being deposited at one certain depth, and the water draining off in the cracks of the ploughing; while the narrow niche in which the seed is firmly wedged, is more easily harrowed up than the round hole made by the dibble. A further and very material advantage attending this machine, is the little trouble that is required previous to the seed being sown; in making use of the Norfolk drill, for instance, it is always necessary that the soil be well pulverized for the reception of the seed; whereas, by employing this drill, the seed may be placed in the soil of the *toughest* furrow,—the only needful preparation (after ploughing) being, that the land be rolled and harrowed a few times over to prevent the skiefs of the drill from following the niches of the furrows. Six horses will certainly be required to draw this drill; but the superior manner in which it deposits the seed, in giving it a *firm hold* of the ground, and placing all of it at a more exact depth, by which the frost is prevented from throwing out the plants in spring, completely overbalances the charge for the horses.—Should the clover crop prove but indifferent, an opportunity will also be afforded of lodging any quantity of hand-tillage with the seed, which in some cases may be of very great benefit.

RICHARD BAYLDON.

Barnsley, 4th May, 1835.

THORN'S TALLY-HO SAUCE.—Having had by no means a trifling experience in British Field Sports of every description, as well as catering for the enjoyment of the table, when the perils and fatigues of the day are over, we take upon ourselves the full responsibility of asserting that neither the gorgeous sideboard in the Squire's dining room, nor the ham-bler Wadett packed for the excursion to the hills on the Moor, can be complete without a bottle of the "TALLY-HO SAUCE."

Lincoln, May 13th, 1835.

Sir,—In your paper of the 11th instant, I observed a letter from "a Nottinghamshire Farmer," requesting some of your correspondents *who have used* "Finlayson's Patent Harrow" to give information how it may be worked with most advantage, and the kind of land on which it is most useful.

Perhaps, in absence of a more able penman, you may think my letter worthy of insertion; more particularly, as I have used the implement every year since 1827, on rather a large scale. In the first place then, the Harrow is entirely made of iron, supported by three cast-iron wheels; and when complete, weighs a little more than five cwt. It covers a space of six feet in breadth, has nine tynes, four of which are placed in the first row, and five in the second.

The depth at which the Harrow is intended to work is adjusted by means of two racks behind, and a lever extending from the muzzle of the implement, to the hand of the conductor, two feet behind the machine. By aid of this lever, the conductor is enabled to throw the tynes out of the ground in turning at the land's end, or when any obstacle comes in their way in their progress through the soil. Now with regard to the best method of using the harrow; no doubt it may be used in many different ways, but I shall give my own plan. This year for instance, I have fifty acres of land designed for *green crops*. In the Autumn of last year, I ploughed this land in the usual way, and suffered it to remain in that state till the 1st of March, when I put four horses to the "Finlayson Harrow" and completed a field of ten acres in one day. In this day's work, the machine was dragged across the furrows, the conductor taking care that the tynes went to the bottom of the furrows but no deeper. On the second day, I put two horses to the implement, and went over the same ten acres in the longitudinal direction of the furrows. After those harrowings, the field was left to its repose and the influence of the atmosphere till the 20th instant, when the field was again gone over by the common harrow at a *quick step*. It may be necessary here to mention, that the Finlayson Harrow acts in the double capacity of plough and harrow. Like a plough in stirring the soil, and like itself only, in *extirpating* the root weeds, and leaving the land in an open and pulverized state to the influence of the atmosphere. The common harrow on the other hand, is only used as a *surface pulverizer* to separate the root weeds from the clods; and in order to do this most effectually, the horses should be driven at full speed. This is of vast importance, as it breaks down the soil and leaves the weeds separated on the surface, which can afterwards be raked off with great facility. But to proceed,—before making my land into *drifts* for *turnips* or *potatoes*, my practice is, to employ the "Finlayson Harrow" again: first *across*, and then *longitudinally* as before followed by the common harrow and rakers; when this is completed, I have no hesitation of saying that my field will be in a fitter state to be made into drills, than if it had got three or four ploughings at no more than half the expense of the common method. But what is yet of more importance, I have always been of opinion, that my crops were better after the harrowing than the ploughing system. Whether this arises from the more complete extirpation of weeds,—the better exposure of the soil to the atmosphere,—or by the tread of the horses' feet being entirely removed by the following harrow, or from a combination of all, I am not prepared at present to state. But, I must not trespass further on your

columns, and have now only to state, that this harrow has saved me the keep of a couple of horses, since 1827. So well is the utility of this implement known in Lincolnshire, that every considerable farmer has one or two on his farm. This may satisfy the inquiry of the Nottinghamshire farmer.

I am, Sir, your most obedient Servant,  
A LINCOLNSHIRE FARMER.

## TO THE AGRICULTURISTS OF GREAT BRITAIN.

TO THE EDITOR OF THE MORNING CHRONICLE.

Manchester, May 19, 1835.

Sir,—Much has been said about your distress, yet still no one can point out what will relieve you. At this time flour and other grain are about the same price they were at the commencement of the war. I used to pay for the load of twelve score of seconds, 24s, or at utmost 26s; after the war commenced it kept advancing until I paid 6l 18s for the same, and before this load was finished it sold at 7l, and 7l 10s. What was then the distress of the poor? At this time potatoes were 20s and 21s the load. Now, as these articles got up, land kept advancing, and the farms began to be let by ticket, and at each letting there were three biddings—the highest price was declared, then it was put up again, the highest declared again, and at the third highest bidding it was let. Now, there was no distress with the agriculturists before these high rents took place. I find that Osgood Hanbury, of Holfield-grange, in Coggleshall, is letting his farms at the rents which he had before the French war. This, my good friends, will relieve you—and this only.

I remain yours,

An Old True-born Englishman of 72 Winters.

|                                |                             |
|--------------------------------|-----------------------------|
| In 1722 it was                 | But in 1822 it was          |
| The husband to the plough,     | The husband tallyho,        |
| The wife to the cow,           | The daughter piano,         |
| The daughter to the sow,       | The wife silk and satin,    |
| The son to the mow,            | The boy Greek and Latin,    |
| And your rents will be netted. | And you'll all be gazetted. |

**DIRECTIONS FOR USING CARY'S CATTLE GAUGE.**—The gauge is a slide-rule of box (or ivory,) accompanied by a measure of tape, marked in feet and inches, with which the length and girth of a beast are first to be carefully taken. The length is to be measured from the foremost upper corner of the shoulder blade bone, along the back, in as straight a line as can be taken, to the hindmost point of the rump, by the side of the tail. The girth is to be taken close behind the fore legs. These measures are sufficient, by the assistance of the slider, to tell the dead weight of the four quarters, either in the London stone of eight pounds, or in the country stone of fourteen pounds. For instance, with a length of five feet, and a girth six feet four inches, if the London weight be required. Place the mark of 8lb. on the lower edge of the slider to five feet on the rule, and then, opposite to six feet four inches on the slider, will be found 34 stones, London weight. Or, if the corresponding country weight be sought, place the mark for 14lb. on the slider opposite to five feet of length and then opposite to six feet four inches of girth, will be found forty-eight stones, country weight.—N. B. If the slider be drawn out of the rule, care must be taken to return it rightly to its place; so that the side for greater girths may correspond to the greater weights.

## IMPROVEMENT BY THOROUGH DRAINING:—FRUITS OF THE DISCOVERY.

We have much pleasure in being able to state, on the ground of reports from various districts of Fife, as well as other counties, that the success attending the adoption of Mr. Smith of Deans-ton's system of draining is complete. Practical farmers assure us it is the greatest improvement made in the art of agriculture in our times, and, in fact, that one of its earliest and surest results will be to destroy in a great measure the existing distinctions and gradations of soils. This does not by one wit surpass our expectations, for what is *outfield*? Is not the expression applicable to all soils, which, whatever their inherent qualities, are barred from the farmer and the community, by the impossibility of drying them—by an unwholesome coldness which kills the seed, and their liability to have their whole manure or vegetable mould run off by superficial currents of water? To every one of these evils, Mr. Smith has supplied a complete remedy; and his system farther enables the farmer to improve or in any way modify the earthy texture or consistency of his soil, by placing at his command ten or twelve inches of formerly unavailable subsoil, which he may at any time bring into action by a course of deep ploughing.

It is impossible to refer to the immediate and more obvious consequences of an improvement of such moment as this, without extending our views still farther, and going into various reflections.

There may be seen in it, in the first place, a fine illustration of the action of principles, which are always opening to a thickly-peopled and apparently exhausted country, new and unexpected resources. What an extent of fresh soil is thus, as it were, created for us,—as if called into existence by a charm or a word! And how strikingly should this intimate to the class of thinkers still inclined to draw *practical* conclusions from Malthus's law of population, that the *modifying circumstances* may often become sufficiently great to cause a virtual annulment of that law? It is not too much to allege that the improvement we are alluding to contains a power of procuring supplies of food, which will offer free liberty of increase to our population for at least half a century to come; and who shall say that before the close of that half century, or during its progress, other principles will not be unfolded prolific with equal or greater benefits? In fact, it is precisely when a Society becomes *dense*—when men are spurred on and enlivened by the intercourse, competition and diffusion of knowledge, incident to a state of crowded population, that the tide of improvement flows rapid and strong.

But it is of more immediate interest to contemplate the changes likely to be thus superinduced on agriculture; considering it as a *trade* it cannot escape the notice of the most superficial, and must, we think, ere long force itself on the convictions of the most prejudiced,—that farming affairs have recently *turned a point*—that they have taken a *set* towards a particular direction—and that the late downward tendency of prices is no fortuitous or temporary occurrence, but the

commencement of a new and permanent state of circumstances which it becomes prudent agriculturists to prepare for, and in reference to which it behoves the whole of us to provide. Nothing can be more evident than that recent low prices have their origin in the *augmented produce of our home harvest*. Of *importation* for the last three years there has been comparatively little, and therefore the conclusion is not to be evaded, that the growing prosperity of Ireland—the release of English agriculture by commutation of tithes—and last, though not least, that complete recovery of *outfield*, which Mr. Smith has just demonstrated not only possible but easily attainable, will all combine to give intensity to the foregoing effect, and if not to bring down the scale of prices still farther, at all events to fix and settle it at its present low point.

Now we maintain—and it is no paradox—that this state of circumstances will not only soon cease to be matter of hardship and complaint with the practical farmer, but that it may and certainly *will* become the means of rescuing him from that condition of uncertainty, fluctuation, and consequent embarrassment, under which he and his family have been labouring since the war. In the first place, it will effectually reduce the Corn Laws to a dead letter, and thereby permit the *easy* re-establishment of that perfectly free commercial intercourse between Great Britain and foreign countries which has been our heaviest national misfortune. When price has settled at the point referred to, the change in question will supervene without disturbing existing contracts or relations; because on account of the *previous* declension of price, these must all have been *previously* adjusted. The removal of restrictions on the corn trade will then appear to agriculturists purely what it is—the only attainable means of delivering price from the capricious influence of the seasons; and there is no doubt that the most valuable, though long and absurdly dreaded reform, will, as if by common consent, be accomplished. Bring us to such a condition, and farewell to our harassing *ups and downs*—these charges which no man can foresee, and against which no human prudence can provide. With a price of produce as stable as Nature will permit the price of any thing to be, how easy, comparatively speaking, may be the farmer! how accurately might he make calculation as to the rent his land can afford, and how seldom would he require to appeal to the mercies and depend on the voluntary reductions of the landlord.

We are not so far as some persons think from this state of things. A few years at the utmost will bring us close upon it; and we do hail and rejoice in that prospect as one which promises a yet unknown and incalculable addition to the sum of human happiness. What happiness will accrue from the single circumstance of agriculture having arrived at the close of its fluctuations, and become one of our securest, instead of the most hazardous investment for capital, they alone can tell who have had experience of it *as it is*, and felt the keenness of the iron of embarrassment and dependence! But of fully as much moment are the *collateral* consequences of the withdrawal of this bone of discord—the rooting out of this bane

of British society. It has long been our solemn conviction that of all obstacles to the course of reform, to the establishment over this empire of rational administrative institutions, and therefore to the full and careering development of the physical and intellectual energies of Great Britain—none now existing can be compared to that bugbear, the Corn Law. The vast proportion of small and moderate proprietors have no personal interest in misgovernment, or in the retention of cumbrous and expensive fabrics, distinguished only by their power to repress national and individual enterprise—their irrationality and mischievousness. The spoil collected and distributed under authority of such institutions, falls into the hands but of a few great proprietors; and the multitude of our possessors of the soil are at present united to this truculent Aristocracy by terror about the Corn Law alone. Remove this cause of sinister and distorting influence, and pure reason will triumph—THESE MEN ARE OURS! They will evince once more the free spirit of the yeomen of England.—they will remember what they contended for of yore.

The same circumstances will lead to the effectual enfranchisement of the tenantry. What prospers their condition, will assure their moral and political independence. Our views in regard to the Ballot are well known; but we do not hesitate to state that the circumstance in the present condition of the franchise which seems to render it chiefly necessary is the pecuniary thralldom under which in consequence of a long period of deepening depression, so many farmers find themselves in regard of their landlords. Let Agriculture become *stable*, and all this will grow well!

Mr. Smith of Deanston is contributing potently to the production of these far-stretching results: most cordially do we acknowledge his services, and rejoice in his co-operation.

The trade in hides in England, as well as France, forms now an important branch of commerce, furnishing in the manufactured state of the skins not only articles of luxury, but of the greatest utility; in the workshops, in the manufactory, in agricultural occupations, in fact, in the houses of all grades of society it is found disguised under a thousand shapes, always necessary, and often indispensable. In England a capital of 14,000,000*l.* to 15,000,000*l.* is vested in the raw and manufactured state of the article, and employment afforded to 290,000 to 300,000 people, who are paid in wages about 9,000,000*l.* The tanning business has of late years made rapid progress in this country, in consequence of the theoretical experiments of chemistry superseding the usually protracted mode of preparing the skins. France has kept pace with our improvements, and the tanneries at Pont-Audemer, Chateau, Kenaud, and Blois, produce leather fully equal to the best samples in England. In Paris, however, the leather is inferior, principally owing to the extent and activity of the demand compelling the tanners to hasten too expeditiously the manufacture, to accomplish which, they make free use of acids among the ingredients, causing the article to become prematurely hard, and of course not so durable; but in France the leather fabrication of sporting articles is much sought after, and it is calculated that upwards of one hundred million pairs of shoes are frequently turned out of

hand in a single year, for which not less than 300,000,000 francs are expended in wages; an enormous sum, when we recollect that the material has cost at least double the amount. The French saddlery is likewise much esteemed, particularly in South America, and since some English manufacturers have established at Ponte-Audemer, the art of varnishing the leather has been considerably improved, the article even possessing more suppleness than that made in England, and commands a preference in foreign markets.

### THE SEE!

Appointed to be sung or said in all Churches or Chapels throughout England and Wales, and in our good town of Berwick upon-Tweed, before the sermon.

The See! the See! the Bishop's See!  
That ever wealthy Bishop's See:  
Its wealth and powers without a bound—  
It feeds on all the country round,—  
It grinds the farmers, eats the tithes,  
And like an incubus it lies.  
I'm in the See! I'm in the See!  
I am were I would ever be;  
With the rich above and the poor below,  
The farmers sigh where'er I go;  
However hard their lot may be,  
What matter? I'm in the Bishop's See.

I love, oh how I love the tithe,  
To see the church and clergy thrive—  
To loll at ease from morn till noon  
Within my splendid drawing-room;  
Whilst the farmers plough and sow  
To make my coffers overflow:  
I never see the starving poor,  
But I love my Bishopric more and more,  
And firmly cling to its well lined nest,  
As a child would cling to its mother's breast,  
For a mother it is, and has been to me,  
Since I have held the wealthy Bishop's See.

The sky was black, and wet the morn,  
In the noisy hour when I was born:  
The tithe pig squeal'd, the thunder roll'd,  
The cattle bellow'd in the fold,  
And never was heard such a hubbub wild,  
As welcome to life the tithe-fed child.  
I've lived since then amidst care and strife,  
Full fifty years a lazy life,  
With wealth to spend, and power to range,  
But never sighed for things to change,  
And death, when'er he comes to me,  
Shall find me in the wealthy Bishop's See.

TIMOTHY FLAIL.

COURTNEY'S CATTLE MEDICINE. — Dear Sir,—In reply to your letter I have much pleasure in informing you that I have used your Balls for the scour in lambs with very good success. My shepherd informs me he has given the contents of eight boxes to 110 lambs with success in every case except one, and in this case the disorder had made too rapid a progress before it was observed for the medicine to have the desired effect; I will further observe that in every case in which we succeeded, the Balls were given in an hour, or two hours at farthest, after the disorder had commenced, and if that had been

done in the case before alluded to, I have no doubt the lamb would have been saved; time, therefore, is a great point to be noticed, because when given on the first appearance of the disorder two Balls were sufficient, if longer time had elapsed, and the scour continued, two more were given in about six hours, but in no case did we give more than three doses or six Balls. Wishing you success, and thanking you very sincerely for the benefit received,

I remained your obliged and obedient Servant,  
JAMES ROBERTS.

Northington Farm, Feb. 27th, 1835.

### JERSEY AND GUERNSEY—FOREIGN CORN.

It will be remembered that a charge of fraudulent importations of foreign corn, to the injury of the revenue and of the fair trader, was made against the Isle of Man, as well as against those of Jersey and Guernsey, from various quarters, and in Parliament in the course of the present Session. At a public dinner, which took place more recently at Hertford, that charge was renewed, and the two last-mentioned islands (Jersey and Guernsey) have defended themselves in a letter to the Noble Lord who presided on that occasion, which was forwarded to us, accompanied by the following note. As we think it but fair towards those islands, even if it were not important to the whole trading community, that the question should be thoroughly sifted and understood, we do not hesitate to comply with the request by giving their communication publicity.

TO THE EDITOR OF "THE MORNING HERALD."

On the 4th instant, an account of an agricultural dinner at Hertford, appeared in the *Morning Herald*, at which the Earl of Verulam presided, and is reported to have accused the inhabitants of Jersey and Guernsey of fraudulently importing foreign corn into England.

This speech being founded on a misstatement in a report of the Customs, the deputies of those islands are anxious to remove the false impression caused by the speech, and have written to Lord Verulam.

They wish to know if the Editor will do the islands the justice to insert their letter.

"Colonnade Hotel, Charles-street, May 6, 1835.

"My Lord,—Having seen, in the *Morning Herald* of the 4th instant, the report of a speech at an Agricultural Dinner at Hertford, attributed to your Lordship, and charging the inhabitants of Jersey, Guernsey, and Man, with fraudulently introducing foreign corn into England, we take the liberty of intruding upon your Lordship's attention, with a view of making you acquainted with the true state of the case.

"Your Lordship is reported to have said, 'that to prevent entirely this surreptitious introduction of corn from Jersey, Guernsey, and Man, Mr. Baring had drawn out a Bill; that he was now out of office, but the present Government would, you had no doubt, prosecute it, because it could not benefit any Government to enable the rogue to enrich himself at the expense of the honest man.' In this last observation we perfectly agree, trusting that your Lordship will equally agree with us, that it cannot benefit any Government to commit an injustice on the weak and innocent, to take from them their good name, and then, on false pretences, rob them of their rights and property.

"Now, my Lord, first separating Jersey and Guernsey from the Isle of Man, between which there is no connection whatever, either geographical, agricultural, or commercial, we claim for the Channel Islands which we represent—we claim for the inhabitants, who find themselves in the position of the weak and innocent above described, the common justice due alike to every part of his Majesty's dominions—due not only from the Government, but from the Members of both Houses, and, therefore, from your Lordship.

"In common with many other distinguished supporters of the agricultural interest, your Lordship has been deceived by the report of the Commissioners of his Majesty's Customs, laid before the House of Commons by Mr. Baring, as the ground for his Bill. And by your Lordship's speech at Hertford, your Lordship has mainly, though innocently, assisted in propagating the groundless charges of fraud against the islands which that report exhibits. We have the honour to enclose our observations on the said report, such as they have been submitted to his Majesty's Government, proving every part relating to the Channel Islands to be erroneous.

"The islands, my Lord, are free from blame. As their Deputies, well acquainted with the facts of the case, we positively deny the existence of fraud. If a Bill be persevered in, it must be on different grounds, it must rest on the fact that, during the five years preceding 1834, the average amount of corn of all sorts imported annually from the islands, as of their growth, into Great Britain, has been 2,237 qrs. And be it well understood that the islands have, and always had, the undoubted right to make such an importation.

"Is it to be believed, that in a country consuming from 40 to 50 millions of quarters annually, three, four, five, or six thousand quarters should be supposed by any man as likely to affect the price of corn, or the interest of the agriculturists? Many of the latter, however, entertain an idea, that all this may be very true, but that prices could never be reduced so low as they are, if there were not, in some way or other, great illegal importations of corn or flour.

"No flour is shipped from the islands of Great Britain, and there can be but two ways in which foreign corn can be illegally conveyed from the islands to Great Britain.

"The first, by making foreign corn pass in England for Jersey or Guernsey corn.

"The second, by the clandestine introduction, foreign or smuggling of foreign corn from the islands into Great Britain.

"The first mode is rendered impossible by the insular regulations and practice. It is not by one general certificate taken at the time of shipment that the corn is cleared out as being the growth of the island; every grower, of the very smallest quantity, must himself appear before the magistrate to swear that he is the grower of corn by him sold to the merchant, or shipper; and as the estates are very small, it requires the oaths of 20, 30, or 40 growers to attest respectively the growth of each man's part of the general shipment; after which the shipper himself must certify that his shipment is composed of the same corn as that purchased from the several growers whose names are on the back of the general clearance, and whose certificates before sworn to are then deposited with the Magistrate. The growers and the extent of their lands being well known, no fraud could be practised without the certainty of detection. The trifling quantities of corn entering the

ports of England free of duty, show that no fraud is committed that way.

"Here it must not be said, that in matters of smuggling, no reliance is to be placed in Custom House returns; this maxim, which is true in ordinary cases of smuggling articles subject to high duties, such as spirits, tea, or tobacco, and where the object is to avoid notice, and to evade, by stealth, the payment of duty—this maxim, true in those cases, will by no means apply to articles which, like our corn, are entitled to a privilege of exemption from duty on importation, and which privilege can only be enjoyed and usefully exercised by means of Custom House clearances and returns. It is idle, therefore, to pretend that large quantities of foreign corn are, or can be introduced into England under the denomination of corn grown in the islands; none can be so introduced, and the quantity of island corn itself imported, can never exceed the amount stated in the Custom House returns, for it is only through these that the corn can be exempted from duty.

"The second mode—that of landing the corn on the coast of England clandestinely, in the same manner as smugglers land spirits or tobacco, must appear, on the least reflection, to be impracticable from the islands. There is no temptation for the engaging in such a traffic. Corn bears no price in England that would by any means compensate for the risk and expense of transporting so bulky and so perishable an article.

"Supposing a difference of 10s, 15s, or 20s per qr., in the price of Wheat in England, over the price in the Islands, the risk and charges would absorb the greater part of this difference; but suppose it all profit to be divided between the eight bushels of 60lbs., and compare the profit of 2s per bushel with the profit of 2s per lb. on tobacco, fine tea, or other goods that might be smuggled, and judge if it be likely that corn will be thought of by the smuggler as an eligible article for him to traffic upon.

"No, my lord, it is not from the surreptitious introduction of corn from the islands, that danger can arise. If any introduction could be effected clandestinely, it would take place, not from the islands where the corn must be brought at risk and expense from Germany, Holland, and Belgium, and when arrived, not be so conveniently situated as before; not, therefore, from the islands, but from the ports of the countries themselves in which corn is at the lowest price, and which ports lie so advantageously for introducing it on the whole of the Eastern coast of England. The proximity of these ports, the price at which corn may there be purchased, so much lower than in the islands, or even in France, all the circumstances of the case must make it evident that it is not from the islands that any fraudulent importation of corn can be apprehended.

"The depression in the prices of agricultural produce may be ascribed to various causes; pretty certain it is, however, that neither legal nor illegal importations of foreign corn are of the number; and still more certain it is, that the Channel Islands can have no connexion whatever with any of those causes.

"We have the honour to be, my lord,  
"Your Lordship's most obedient, humble servants,  
(Signed) "DANIEL DE LISLE BROCK, Bailiff of  
of Guernsey,  
"THOMAS L. BRETON, Attor. Gen. of Jersey,  
"J. LE COUTEUR, Jurat of the Royal Court of Jersey.

"To the Right Hon. Earl Verulam."

## DEEP FIRING FOR CHRONIC LAMENESSES OF THE HOCK AND LEGS.

By MR. J. COOMES, V.S., BENGAL HORSE ARTILLERY,  
NOW AT PERSHORE.

(From the Veterinarian.)

The following case is extrated from my registry of sick and lame horses. If approved of, it shall, at no great distance of time, be followed by others.

Dec. 10th, 1832.—An aged troop horse was admitted into the hospital stable this morning in consequence of severely injuring both hind legs by entangling them in the wheel of a gun carriage while at practice. There were slight contusions on the near leg: the off one was dreadfully bruised, and the horse could not rest the least portion of his weight on it. When held up, it appeared as though the tibia was fractured, the hock and leg having an exceedingly rotatory motion. On minute examination I ascertained that the gastrocnemius muscles were ruptured where they become tendinous. Six quarts of blood were taken from the femoral vein, and a patten shoe applied. Repelling lotions and fomentations were ordered, and a purgative administered.

11th.—Patient in *status quo*. Fomentations continued.

18th.—No perceptible amendment. It is very strange that no swelling has taken place. The parts must be roused into action; therefore let a blister be applied.

20th.—The blister has produced a violent inflammation, and an enormous swelling. Treatment, fomentations and physis.

27th.—Inflammation abated; swelling less. He can now bear a little weight on the feet. Apply a charge to brace up the injured parts.

Jan. 6th, 1833.—The patient improving slowly; but when the foot is elevated from the ground, the leg has still a sort of rotatory motion. Continue the charge.

20th.—The injured muscles are extremely weak and relaxed. Patient very lame. This morning I adopted my favourite remedy for all long existing cases of lameness in the hock and legs, viz., the actual cautery, deeply and extensively.

30th.—Inflammation diminishing from the effects of the cautery.

Feb. 10th.—I had him led out; he walks much better. The patten shoe was removed, and a thick heel then applied.

15th.—Lameness going off rapidly.

20th.—The firing has had a very excellent effect: he can now trot tolerably well. The firing produced a deep-seated inflammation and effusion, which united the ruptured parts together.

March 7th.—Discharged fit for duty. I attribute the cure to the effects of the cautery, as it very soon made the horse a fit and proper subject for a species of military duty which is sometimes particularly laborious.

AMERICAN COURTSHIP.—Davy Crockett thus describes his first courtship:—Sally and I were left sitting a good yard apart, honest measure. For fear of getting tongue-tied again, I set right in with a steady stream of talk. I told her all the particulars about the weather that was past, and also made some pretty cute guesses at what it was like to be in future. At first, I gave a hitch up with my chair at every full stop. Then growing saucy, I repeated it at every comma, semicolon, and at last it was hitch, hitch, hitch, and I planted myself fast by the side of her. "I swow, Sally, you looked so plaguey handsome

to-day, that I wanted to eat you up." "Pshaw, get along you," said she. My hand crept along, somehow, upon its fingers and begun to scrape acquaintance with her. She sent it home with a jerk. "Try it again"—no better luck. "Why, Miss Jones, you're gettin' upstropulous, a little old maidish, I guess." "Hands off is rair play, Mr. Beedle." It is a good sign to find a girl sulky. I knew where the shoe pinched. It was that Patty Bean business. So I went to work to persuade her I had never had any notion after Patty, and to prove it, fell to running her down at a great rate. Sally could not help chiming in with me, and I rather guess Miss Patty suffered a few. I now not only got hold of her hand without opposition, but managed to slip an arm round her waist. But there was no satisfying me; so I must go poking out my lips after a buss. I guess I rued it. She fetched me a slap in the face that made me see stars, and my ears rung like a brass-kettle for a quarter of an hour. I was forced to laugh at the joke, though out of the wrong side of my mouth, which gave my face something the look of a gridiron. The battle now began in the regular way. "Ah, Sally give me a kiss, and ha' done with it now." "I won't, so there, nor tetch to." "I'll tak it, whether or no." "Do it if you dare." And at it we went, rough and tumble. An odd destruction of starch commenced. The bow of my cravat was squat up in half a shake. At the last bout smash went shirt collars, and, at the same time, some of the head-fastenings gave way, and down came Sally's hair in a flood, like a mill-dam broke loose, carrying away about half a dozen combs. One dig of Sally's elbow, and my blooming ruffles wilted down into a dish-cloth. But she had no time to boast. Soon her neck tackling began to shiver. It parted at the throat, and, whorrah, came a whole school of blue and white beads, scampering and running races every way about the floor. By the hokey, if Sally Jones isn't real grit, then there's no snakes. She fought fair, however, I must own, and neither tried to bite nor scratch; and when she couldn't fight no longer, for want of breath, she yielded handsomely. Consarn it how a buss will crack, of a still frosty night. Mrs. Jones was about half way between asleep and awake. "There goes my yeast bottle, says she to herself, burst into twenty hundred pieces, and my bread is dough again." The upshot of the matter is I fell in love with Sally Jones, head over ears. Every Sunday night, rain or shine, finds me rapping at Squire Jones's door, and twenty times have I been within a hair's breadth of popping the question. But now I have made a final resolve; and if I live till next Sunday night, and I don't get choaked in the trial, Sally Jones will hear thunder.

LUSUS NATURÆ.—We have been much pleased with the sight of a most extraordinary *lusus naturæ*, at Mr. Mellor's, barber, in Fisher-gate, who is so justly celebrated for his skill in preparing animals. It consists of a black kitten, with two bodies, eight legs, and one neck and head. The position of the two bodies is that of two animals fighting, and standing upon their hind legs. It is altogether the most singular animal mal-formation that we have recently seen.—*Nottingham Review*.

SEA-WEED MANURE.—Fleets of boats, to the number of 60 or 70, are daily arriving at Galway with sea-weed for manure from Cunnamara, Arran, and the county of Clare, which is purchased with avidity, and conveyed in carts all over the country in various directions, even to the distance of 40 or 50 miles into the interior.

## REMARKS ON THE MODE OF HARNESSING HORSES ON THE CONTINENT.

(BY THE AUTHOR OF 'BUBBLES FROM THE BRUNNENS OF NASSAU,')

Many years have now elapsed since I first observed that, somehow or other, horses on the continent manage to pull a heavy carriage up a steep hill, or along a dead level, with greater ease to themselves than our English horses. Let any unprejudiced person attentively observe with how little apparent fatigue three small ill-conditioned animals will draw, not only his own carriage, but very often that overgrown vehicle, the French diligence, or the German eil-wagen, and I think he must admit, that somewhere or other, there exists a mystery. But the whole equipment is so unsightly, the rope-harness so rude, the horses without blinkers look so wild, that far from paying any compliment to the turn-out, one is apt to condemn the whole thing, and not caring a straw whether such horses be fatigued or not, to remark that in England they would have travelled at twice the rate with one tenth of the noise. But neither the rate nor the noise is the question I wish to consider. The thing I want if possible to account for, is, how such small weak horses *do* manage to draw one's carriage up hill, with so much unaccountable ease to themselves.

Now in English, French, and German harness, there exist, as it were, three degrees of comparison in the manner in which the head of the horse is treated; for, in England, it is elevated by the bearing rein; in France, it is left as nature placed it, (there being, in common French harness no bearing rein); while in Germany, the head is tied down to the lower extremity of the collar, or else the collar is so made, that the animal is by it deprived of the power of raising its head. Now, passing for a moment the French method, which is the state of nature, let us consider which is best, to bear a horse's head up, as in England, or to pull it downwards, as in Germany. In my humble opinion, both are wrong; yet there is some science in the German error, while ours goes directly against all mechanical calculation.

In a state of nature, the wild horse has two gaits, or attitudes. If man or beast come suddenly on him, up goes his head, and as he first stalks and then trots gently away with ears erect, snuffing the air, the feelings of doubt, astonishment, and hesitation seem to rein him, like a troop horse, on his haunches; but attempt to pursue him and how completely does he alter his attitude! Down goes his head, and from his ears to the tip of his tail, there is in his vertebrae an undulating action which seems to propel him along, and the privation of which would manifestly diminish his speed. Now, in harness the horse has naturally the same two gaits or attitudes, and it is quite true that he can start away with a carriage, either in the one or the other, but the physical powers which he calls into action are essentially different, for in the one attitude he works by his muscles, in the other by his weight. In France, and particularly in Germany, horses do draw by the weight, and 'tis to encourage them to raise their backs, and lean downwards with their heads, that the Germans, with a degree of rude science, tie down the horse's nose to the bottom of his collar; and that the postillion at starting, speaking gently to him, allows him to get himself into a proper attitude for his draught. The horse, thus treated, leans against the resistance he

meets with, and the balance of draught against weight being in his favour, the carriage follows him without much more strain or effort on his part, than if he were idly leaning his chest against his manger. It is true the flesh of his shoulder may become sore, from severe pressure, but his sinews and muscles are comparatively at rest. Now, any one who observes a pair of English post-horses dragging a heavy weight up a hill, will see at once that the poor creatures are working by their muscles, and that 'tis by main strength the resistance is overcome: but how can it be otherwise? for their heads are considerably higher than nature intended them to be, even when *walking*, unincumbered, and at liberty. The balance of their bodies is, therefore, absolutely turned *against*, instead of leaning in favour of their draught, and thus cruelly deprived of the mechanical advantage of weight which everywhere else in the universe is appreciated, the noble spirit of our high-fed horses induces them to strain and drag the carriage forward by their muscles; and, if the reader will but pass his hands down the back sinews of any of our stage-coach or post-chaise horses, he will soon feel (though not so keenly as they do) what is the fatal consequence. It is true that in ascending a very steep hill, an English postillion will occasionally unhook the bearing reins of his horses, but the poor jaded creatures, accustomed for years to work in a false attitude, cannot in one moment get themselves into the scientific position which the German horses are habitually encouraged to adopt; besides this, we are so sharp with our horses—we keep them so constantly on the *qui vive*, or, as we term it, in hand,—that we are always a driving them from the use of their weight to the application of their sinews. That the figure and attitude of a horse working by his sinews are infinitely prouder than when he is working by his weight, I most readily admit, and therefore, for carriages of luxury, where the weight bears little proportion to the powers of the two noble animals, I acknowledge that the sinews are more than sufficient for the slight labour required; but to bear up the head of a poor horse at plough, or at any slow heavy work, is, I humbly conceive, a barbarous error, which ought not to be persisted in; for laughing, as we all do, at the German and French harness, sneering, as we do at their ropes, and *wondering out loud*, as we always do, why they do not copy us, it is rather mortifying to find out, that, in spite of our fine harness, for slow heavy draught, it is better to tie a horse's nose *downwards*, like the German, than *upwards*, like the English, and that the French way of leaving them at liberty is better than either.

---

EMIGRATION FROM HOLLAND. — The *Groningen Courant* says that a M. R. Benke, a farmer at Zuurdijk, with his whole family, had left his farm, which is considerable, to emigrate to North America, and ascribes his emigration to the continued depression of agriculture. Without discussing at present the question whether agriculture really is so depressed as the *Groningen Courant* believes, we find it difficult to suppose that this depression induced the farmer in question to abandon his country with his family, since he might easily have known that all the farmers who have latterly emigrated to the United States give no very flattering description of their situation, and that most of them would be happy to return to the country they have forsaken, had they not lost the little property they carried with them, and are therefore unable to defray the expense of their passage back.

## AGRICULTURAL REPORT.

## SUFFOLK.

Since last report we have had rather cold chilling weather, chiefly, some rain, and some thunder storms and frosty nights, but nothing to injure the crops much; some of the barleys are not looking healthy; others much injured by the wire worm, but altogether we may say thus far, alls well.

Grasses of all species have not pushed forward rapidly, but the tares, lucern, and saintfoin, is being cut for soiling. The clovers are a failing crop over a great space, and the pastures will not produce an average crop probably, thus we must be short of provender during another winter.

The young layers have planted well, a great breadth of mangel wurzel is planted, and well up, and much land is nearly ready for Swedish turnips, and the fallows are in a forward state.

Lucern and tares were being cut here and there for soiling during the first week in the month; and generally by the second week, some fields of trifolium might have been began as soon, but we suppose it will be chiefly saved for seed. It certainly is a plant of great promise—we should be glad to be informed whether it has been known to stand through a sharp winter—if so we predict that a new era in agriculture has arrived.

Stock of all kinds is rather dull sale, horses are very low in price; thousands have been imported of late years and over stocked the country. Barley, oats, peas, and beans continued to be imported into our sea ports, and also several ship loads of potatoes, and this has brought down the price in these towns to 1s per bushel, and some less. All garden produce is very cheap.

Wheat does not rise in price, and calculating the condition, we may say it is even lower. Things cannot go on thus for any length of time; we cannot continue to pay 2 bushels of wheat or 3 sacks of potatoes per week for labour wages; nor can blacksmiths, wheelwrights, and other farm-tradesmen's charges be sustained—every charge will be driven down to the lowest limit, and trade and the revenue will fail.

There have been several meetings of unemployed labourers of late, but no indication of riot, nor scarcely any apparent bad feeling towards the farmers. They are greatly to be pitied, they have no means of earning a livelihood; the farmers cannot find employment for the men, and the women and children have no profitable employment. A correspondent has put the following questions in the Ipswich papers, which he proposes to consider next week.

1st. Are the poor an evil at all to the rest of the community?

2dly. Supposing them to be so, what is the cause?

3rdly. Supposing them to be so, will the unions and big workhouses and the migration scheme remedy the evil?

4thly. If those measures would remedy the evil, can they in fact be carried into effect, and might not other and less harsh measures attain the same end?

I am heartily glad to see that the cause of the poor is taken up by a person who seems able and willing to state their case clearly, and if I do not mistake the writer, the subject will be handled fearlessly and honestly; in fact its taken up from patriotic motives, as, if I am correct, the writer is *not a farmer, does not occupy any land*, and of a fraternity who thrives most when the community is least prosperous. We are in no difficulty but what may be remedied; we should not have one able and willing labourer wanting employment if the price of produce

was remunerating, a just and equitable law passed to secure the tenantry, remuneration for out-lay of capital not reimbursed, (as advocated by the Author of the Rights of the Farmer) and security from the effect of the present unjust, impolitic laws. There are many other matters that require attention, but these are the vital questions which apply to the whole community. The repeal of the malt tax would be the greatest benefit to the tenant farmers and labourers, and without its repeal the nation never can prosper; nor never ought;—but 'tis in vain to attempt to enter into detail as to the baneful effects of this tax; I hope Cobbett is prepared with documents to show the falacious opinions which prevail on this subject and combat the *unanswerable arguments* of Sir Robert Peel; I hope every friend to the repeal will furnish him with some local effects that he may select cases in point. If he succeeds in obtaining the abolition of this tax he will deserve the thanks of the entire farming community, of the labourers and their posterity for ever; but I hope and trust that Mr. Cayley will succeed in obtaining a select committee to consider what can be done to give prosperity to agriculture; there are no other means on earth of coming to right conclusions on the subject; relief from local taxation is desirable, but unless a radical measure of relief is adopted it will avail us little; mere politics will not suffice. We do not advocate the repeal of the malt tax from "*being impatient of taxation*" generally, but from very different motives; we well know that whilst the debt remains we must have taxes to pay the interest, but the debt and taxes are no absolute bar to prosperity—a judicious and equitable mode of taxation is all we ask; all that is requisite. I am glad to find that an attempt is making to establish a committee of deputies, from the several counties to watch the interests of agriculture, but after the failure of the gigantic exertions of the late Mr. Webb Hall we can scarcely hope for success; however conviction has reached a different class since that period, the landowners begin to shake in their harness, and the fundholders are a little alarmed, save and except a few blind and infatuated large foundholders and sin-courists. An anonymous writer (pamphleteer) asks, "What the farmers will do now?" to which I reply, *nothing, but grumble*. They are beset on all sides; their case seems hopeless. The numerous sales of stock, &c. preparatory to giving up, and the foreclosing mortgages, is a sure sign of the state of the farming public.—May 25.

STATISTICS EXTRAORDINARY.—There is iron enough in the blood of 42 men to make a ploughshare weighing 24lbs. The quantity of brass in their faces it is not so easy to calculate.—*Buffalo Paper*.

THE TEETH.—Many publications have appeared from time to time professing to give directions for the preservation of the teeth. We have, however, not met with any work in which Dental Surgery has been so systematically treated, and that too without destroying its practical utility in the hands of the unprofessional reader as in Mr. Mallan's "*Practical Observations on the Physiology and Diseases of the Teeth*." The rules which he lays down for the preservation of the teeth, are so simple and so easily adopted, that we feel confident all who study cleanliness, and value beauty and durability of the teeth, will lose no time in making themselves acquainted with them, and adopting them.

## AGRICULTURAL INTELLIGENCE, FAIRS, &c.

**NEWARK MAY FAIR** was abundantly supplied with cattle of all descriptions, which were eagerly sought after, at considerably advanced prices. Fine fat beasts made full 7s per stone. In the sheep fair all the pens were filled at an early hour, which sold well—especially lamb hogs. Horses were an indifferent show, there being very few good ones.

**CHIPPENHAM FAIR** was the largest that has occurred within the memory of the oldest person in that town. The number of young oxen, heifers, and horned cattle in general, was immense; fat beasts not so numerous. Considerable business was done; and, upon the whole, good prices were obtained.

**KESWICK SPRING CATTLE FAIR.**—The second Spring Cattle Fair was held on the 21st inst., the goods exposed to sale were not numerous, and were mostly sold at what were considered fair prices.

**EGREMONT SPRING FAIR.**—The number of cattle exhibited at this fair was greater than at the spring show of last year, but the quality, generally speaking, was inferior. Good milch cows brought tolerable prices, as also did geld cattle of the best quality, but the sales were slow, and the prices something less than at last year's fair. The short-horned breed are in the greatest demand, and bring the best price. A great number of beasts remained unsold.

At **WHITSUNBANK FAIR**, the show of fat and grazing cattle was considerable, but the demand was indifferent. Fat sold from 5s to 5s 6d per stone, and two-year-olds realised from 8l to 10l, according to quality. The supply of hogs was also considerable, and more than the demand, hence sales were dull. Full-bred hogs were sold from 32s to 36s. Half-bred ditto, from 22s to 26s. Although there was a great number of horses of all descriptions in the market, yet those only of superior quality were in request, and brought fair prices to the dealer.

**TREDEGAR FAIR.**—The fair held here, passed off much to the satisfaction of the inhabitants, and of the dealers in general who attended. Horses, particularly strong draught ones, sold exceedingly well; cattle were in good demand, and fetched remunerating prices, and very few returned unsold; pigs were eagerly purchased at good prices;—indeed, the disposition *buy* appeared to prevail,

**ALNWICK WOOL FAIR.**—An annual fair for the sale of wool, is to be held in this town, in the month of July—to commence on the 11th of July next.

At **DENNY SUMMER FAIR** the ordinary number of cattle were brought forward. The market was what is termed a stiff one, but a good deal of business was done. Cows near the calving were in demand, and brought tolerable prices. One very fine cow of this description was sold for 12l, but the general average of prices was much lower, varying from 6l to 9l. Farrow cows for the grass were sought after, but the prices obtained were not great. There were few good cattle in the market, and for them also the sales were far from brisk.

**KNIGHTON FAIR** exhibited but a small and indifferent show of fat and other beasts, owing to the late scarcity of grass; there were, however, many buyers, and the sales effected commanded better prices than has been obtained at some of the recent fairs, and on the whole quite as much business done as could be expected. Pigs were very briskly sought after.

**MILNTHORP FAIR.**—The quantity of beasts offered for sale was very large. Prices were considerably lower than what had been anticipated by the farmers, and but few were sold, even at the reduction. It was to all intents a dull, heavy fair.

**HANDFORD HALL CATTLE SHOW.**—The attendance of graziers and others was very numerous at this fair. The show on the whole was considerably larger than that of last year, and as regards sheep, the number was doubled. There were upwards of 4,000 hoggetts in the field. The sales were very flat in the early part of the day; but between 2 and 3 o'clock many lots were sold. For the better sort, there was a good demand, and prices may be quoted from 30s to 40s. Inferior stock met with a slow sale. Fat sheep out of their wool sold at about 6d per lb., and the demand was pretty brisk. A lot of hoggetts, out of their wools, sold at 34s 6d. Fat beasts were in great demand, but of the whole brought to Ipswich, the greater number were sold before they arrived upon the ground. There was a tolerably good supply, and prices may be quoted at from 6s to 7s per stone. The arrangement for holding this Fair, on the third Tuesday in May, has given universal satisfaction.

**THE HIGHLANDS. — LAMING SEASON.**—The spring has been a backward one. The heavy snow storm in March, followed by a continuation of cold dry biting winds during the month of April, and often accompanied with snow, proved rather unfavourable to the flocks—grass made very slow progress particularly on the moors upon which they so much depend, consequently sheep had a crimped appearance. Holders of high exposed farms complain of loss in ewes and lambs to a extent their brethren, in snug low and sheltered situations, can scarcely credit. There is an average crop of lambs, but they have not, generally, that fresh and plump appearance, that naturally follows a right flow of milk from the dam. Excepting on principal good farms, pairs are not so numerous as last season.—The good effects of the showers since May commenced, had been considerably counteracted by the cold dry winds so immediately following—on the 13th and 14th instant the hills had a thick coating of fresh snow.—Owing to the great demand for great ewes at the House of Muir and other markets in the south, sheep stocks to be transferred by valuation at this term, are expected to bring good prices—any reference to the prices of the Falkirk Trysts must, of course, be regulated by those. Wool has declined a little since the close of last year, but is now, it is hoped, at the turn, the stock on hand being considered light. Excepting for Amulree market, or grass parks, little business is done in the cattle trade during spring, the principal breeders of stock hold extensive grazings, and seldom effect sales till harvest. Upon the whole, if the prospects of the store-farmers are not so very promising as at this time last year, they are far from being gloomy or desponding.—May 16.

**SALE OF STOCK AT FOSS.**—On Tuesday last, the celebrated stock of Highland-bred cattle, reared by the late Mr. Stewart Menzies, were sold in presence of a very numerous and respectable company. Some queys, a cross betwixt the Ayrshire and pure Highland, fetched from 18l to 20l; two and three year old stirks from 12l to 18l a-head. The quality of the breed was the great enhancement of their value, for in some cases the price fetched was at the rate of about eighteen shillings a stone Dutch! A few lots of Leicester ewes were also sold at high rates.

There were upwards of 2000 beasts at Uppingham market on Wednesday—a larger number than known for some years.

**EXETER FAIR.**—We scarcely know when we saw a less quantity of fat bullocks: indeed, of good bullocks we may say it has been a very thin fair; it has had this advantage, however, and we have no little pleasure in stating it, that in this respect it has been a selling fair, these articles having been taken off freely at from 7s 6d to 8s 6d per score, and very nearly all if not the whole will be sold out. There has been a large supply of lean Stock, and not only a good many East Country men here to take them off, but our own graziers have been dealing also. Still we must not be understood to say the sale in this way has been brisk, as it will be nearer the truth if taken to be of a medium character. Neither can it be said there has been any advance in this description of stock from recent market quotations; undoubtedly the best bred poor heifers have made freely 6s or near upon that price per score, but generally speaking the quotation must be confined witium from 5s to 6s per score. Cows and calves have been numerous but on dull sale, and the greater proportion of these will be driven off unsold. The quality of them too has been very varied, those in which business has been done, having been at from 8l 10s to 13l, or from 7s 1d to 8s 3d per score.

**HEREFORD FAIR** exhibited a very good show of cattle, for which there was a brisk demand—fat animals experienced a small advance, and sold from 5½d to 6d per lb; steers and stores went on rather better terms than at last fair, and all were disposed of. Fat shorn sheep sold from 5½d to 6d per lb. The horse fair contained a large number of animals, but few good ones—fine animals were in request, and commanded good prices. At Leominster Fair there was a full supply of stock, which sold readily and at good prices. Cheese as follows:—Best making from 50s to 36s; two-meal 55s to 49s; family 20s to 25s.

**AUCHTERARDER MAY MARKET** was much better attended with stock and purchasers than we ever saw it.—Prices were five per cent. higher than two months ago, though perhaps still seven or eight per cent lower than they were at this market last year; and good judges are of opinion that graziers will stock their parks even yet ten per cent cheaper than last year. Grass parks have let from three to four cent higher in this neighbourhood than last year.

**MUIR OF ORD MARKET.**—At this tryst a great number of cattle dealers, both from the Highlands and from the South of Scotland, were present, and much business was done. The cattle were in good condition, and the prices were considered rather higher than could be obtained at the May tryst last year. Three-year-old stots sold at 4l 10s to 8l 10s, and some superior lots fetched 10l odds. Two-year-old stots brought from 3l to 5l; a few excellent two-year-old stots sold so high as 5l 15s. Few milch cows were shown: those on the muir were readily disposed of at prices varying from 4l 10s to 8l 8s. Several lots of sheep were offered for sale: for black-faced wethers, from 13s to 19s were asked, but few sales were effected. Some horses were shown, but scarcely any changed owners.

**AN EXTRAORDINARY-SIZED HEART.**—Mr. Palmer, of Clapham, butcher, on Tuesday last killed a heifer weighing only 62 stone, whose heart was of a very uncommon size, and without the least appearance of enlargement from disease. It measured 27½ inches in circumference, and when trimmed up ready for the spit, weighed 12lbs. The ordinary weight of the heart of such an animal is from 3lbs. to 4lbs. The heifer, when killed, was in perfect health, and in good condition.

**PROSPECTS OF THE HARVEST IN FRANCE.**—The *Mémorial de la Scarpe*, a Douai Paper, states "that the oldest agriculturists in that part of the country are of opinion that there never was a finer prospect of a good harvest than this year, and that if no unforeseen event occurs, it will exceed in abundance that of 1833."

**CURIOUS BREED OF SHEEP.**—Mr. J. Hammond, of Scarborough, has now in his possession a certain cross of ewes, which have lambed three times in twelve months, namely, in November, 1833, and again in May and November, 1834. These ewes are at present upon the eve of again bringing forth; therefore, judging from what has already taken place, there is every probability that they may lamb five times in two years. So much attention has the circumstance already excited, that we learn it has already reached the ear of his Majesty, who has been pleased to desire that one of the lambs may be sent alive to him, at the Home Park, Windsor.

**STATE OF THE CROPS.**—Throughout the southern part of the West Riding of York the crops present a most luxuriant appearance. The young wheat is strong and healthy, and though it has in many places suffered from the recent frosts, yet it appears to be fast recovering from the attack. In Derbyshire also, and in the south and east of Staffordshire, vegetation has assumed a similar aspect, and there is every reason to hope for a very fair average, if not an abundant harvest. The fruit-trees in the north not being so forward as those in the more southern districts, have not suffered so much by the cold and wintry nights of last month.

**ROMNEY MARSH.**—Notwithstanding the recent refreshing rains, the disastrous effects of the long drought are still felt by the graziers in this extensive district. The supply of water in the ditches for some months past has been kept up by admitting the sea; and this, with the great want of natural food, has proved highly pernicious to the stock which has been suffered to winter there. Immense numbers have died; and many of them in apparent health, have dropped down in a manner surprisingly sudden. It is not unusual to see bullocks that have necessarily been taken from the pastures, slung up in the lodges to enable them to feed. The fall of lambs is calculated at not more than 65 to the hundred of last year; and some idea may be formed of the general mortality from the circumstance of one grazier having within a short period, sent to the tan-yard upwards of 300 skins of animals of every class, that have fallen victims to the fatal epidemic.—*Maidstone Journal*.

On the 6th inst., Mr. John Bird, butcher, of Stroud, Gloucestershire, slaughtered an ox, bought of Mr. Haines, of Stratton, near Cirencester, whose weight was 46 score, with a kidney weighing 117 pounds, the dimensions of which were 56 inches round, and 18 inches across.

Mr. Richard Bagshaw, of Newton, near Kettering, had a number of pigs poisoned the other day, in consequence of their having eaten some autumnal crocuses, which had been dug up by his gardener and unthinkingly thrown to the dunghill.

## RETROSPECT OF THE WOOLLEN TRADE.

*Leeds.*—Some quarter of a century ago the establishment and progress of the factory system in the manufactures of this district gave rise to serious alarms for the independence and comfort of an important class in the community. Not that the ad-

vantages of that system were not clearly seen and correctly appreciated; on the contrary, it was the very distinctness of those advantages which produced the gloomy forebodings, for it was naturally, although hastily, concluded that as none but large capitalists could possess the means of concentrating and subdividing labour to the extent required; of erecting masses of buildings and stocking them with machinery of the best and most expensive kind, for the purpose of ensuring the greatest amount of produce from that labour; and finally, of commanding and conducting a trade of such magnitude as to absorb that produce, so the small domestic manufacturers, who had hitherto maintained the character of masters, and had brought up their families in comfort under the paternal roof, with such prospects as the paternal example afforded, would never be able to stand a competition so powerful, but must sooner or later, one by one, or in the mass, sink themselves and their families into a state of servitude; go forth from their hitherto cheerful and busy homes to seek a precarious subsistence in the crowded mill, uncared for, unrecognized, undistinguished, and without hope of distinction, save such as one machine may possess over another, and, amidst the contagion of spreading evil, must yield up the exercise of parental care and control into the hands of some mercenary hireling, the sole connecting link between them and their monopolizing employer. Such was the prospect which presented itself to the mind of the philanthropist. The premises seemed to be correctly laid down, and the conclusion, therefore, seemed irresistible; but there was one little element in the calculation of chances which no one thought of at the time. No small manufacturer with limited means could hope to bear up single-handed against this formidable competition, but it was found that a number of them combined might not only maintain their position, but actually advance that position, by availing themselves of every advantage presented by the improved system. The operation was very simple: shares of small amount each were taken by a number of manufacturers with the object of building and stocking a mill for their own district. As far as the mill is concerned, all the shareholders are, of course, partners, but no farther; each one carries on his individual business as before, but is bound, not more by contract than by his own interest, to take his work to that mill. It is only in certain stages of the process of manufacture that the advantage of the mill system is experienced, and these are precisely the most profitable of the whole operation. After the wool is ready for the spinner's hands all it requires further at the mill is well thumping in the fulling stocks to convert the raw web into a thick cloth; all the intermediate operations are performed just as well in the cottage as in the factory, and so the manufacturer continues to have employment for his family and dependents on his own premises, and under his own immediate eye. The numerous company mills thus constituted in our neighbouring villages may lay claim to some important advantages over those of private partnerships. It rarely happens that all the shareholders of the former are deficient of employment at the same time; if one fall slack, another may be busy, and, hence there is a greater chance of regular and constant work for the mill. In management and economy they enjoy another advantage. Wherever the immediate control may be vested, there is still a continual vigilant supervision exercised by each shareholder whilst looking after his own work, and he will not fail to detect an instance of mismanagement, or improvidence much sooner than could be done by an individual owner, possessing, probably, little practical know-

ledge, but obliged, therefore, to trust all to servants. In the event, again, of bad markets, and inadequate prices for his goods, the mill shareholder has still the consolation of deriving some profit from the mill work, and thus redeeming at least part of his loss by that which would else have gone into other pockets.

Such may be termed the physical advantages of these establishments. The moral advantages may be considered no less prominent. The crying evil charged upon the factory system has been its encouragement of vicious propensities by the promiscuous assemblage of individuals under no efficient moral check, the employer and the employed being separated by an interval so wide that no community or sympathy of feeling exists between them, but all is resolved into a mercenary consideration of labour and pay. This objection loses much of its force, if it be not altogether obviated, in the constitution of the Company Mills. The employers and the employed stand in much nearer relation; they are but little removed from each other in point of station; their habits and feelings scarcely differ; they mix too much in the character of friends and neighbours to allow that which is esteemed as decent and proper by one to be treated with reckless indifference by the other.

It is probable that had the factory system been applied in this manner only, we should have heard little of the want of a factory bill to regulate any monstrous abuse of infant labour, which is here too much controlled by the natural feelings of parents and friends to afford room for the exercise of tyranny or abuse, and we are therefore not surprised that in such quarters official interferences, and the imposition of sixpenny fees, excite feelings of indignation.

So far, then, have the fears for the result of the factory system proved groundless in this instance, that if we were required to point out one single cause to account for the gratifying prosperity at present enjoyed by the domestic manufacturers, we should assign just this one. Inconvenience has been felt it is true. Some inconvenience and suffering are inseparable from any state of transition. At first the great manufacturers attempted too much; they would do everything; but as the capabilities of the system became developed it was seen that there was yet room for all. The parties are at the present moment in a position somewhat reversed; the country mills are so overstocked with work that they are obliged to seek assistance, and are actually giving employment to less fortunate private mills here in the town.

Generally speaking, we regard the activity of the country mills as the sign of a good and a sound state of trade; there may be exceptions, but we think this may be taken as the rule. At the same time we repeat our conviction that there is yet room for all. The town mills may not be able to deprive the country mills of employment, but there is a distinct field open to them, if they will but cultivate it, in the production of the finest cloths, with which, we have no doubt, they may have the supply of the world if they like. But there must be no more halting between two opinions; a flimsy, showy article may suit the dishonest purposes of a London swindler, and so long as they supply it to him they may expect to be treated by him with bullying insolence as if they were partners in crime. Such an article will not command the trade we speak of, and we are the more free to pronounce so unreserved an opinion on the subject because we have the means of knowing that our real capabilities have been tested, and have proved us competent to produce an article which, in spite of all opposition, will command any market.

## REVIEW OF THE CORN TRADE IN MARK LANE DURING THE MONTH OF MAY.

During the past month the aggregate average price of wheat throughout the kingdom, has not exceeded 38s 10d, which, according to the Winchester measure, would be equivalent to 37s 8d, being lower than the average of the last 55 years, when in 1779 and 1780, the rates were 33s 8d, and 35s 8d. In reviewing the averages of the kingdom for the last four weeks, we find that in the home counties the prices have ranged the highest; for instance in Essex, the quantity of wheat returned, as sold, has amounted to 10,491 qrs, at an average value of 41s 11d; in Kent, 5501 qrs, at 41s 7d, and in Suffolk, 17,466 qrs at 40s 4d. In other principal counties the currencies have been lower. In Yorkshire, 47,646 qrs have been sold at 38s 5d, in Lancashire, 21,330 qrs at 37s 14d, in Norfolk, 19,670 qrs at 37s 7d, in Lincolnshire, 23,855 qrs at 36s 9d, and in Cambridgeshire, 15,594 qrs at 36s 1d. The most depressed prices realized, have been in Oxfordshire and Huntingdonshire; in the former county, 1067 qrs have averaged only 34s 7d, and in the latter 1676 qrs at 34s 8d. This pressure on the trade at most of the leading markets, attracted at the beginning of the month, some little speculative attention, and the London as well as the country markets exhibited more disposition to rally, and assumed a more encouraging aspect, than had been experienced for many weeks, prices advancing fully 1s per qr, and it was thought, that the reaction was at length about to take place, which always sooner or later operates on a market, after the prevalence of any violent depression or excitement. Some speculative purchases were effected on the coast; heavy samples of wheat, weighing 63lbs, were bought in Lincolnshire, Suffolk, &c., at 36s 6d to 37s 6d, and some orders were transmitted abroad, where the inducement for the investment of capital is considerable, the article, as in this country, bearing a lower relative value, than any other species of grain; especially when it is recollected, that the superiority of the quality and condition of the last crop, causes the article to command a preference of all the old wheats now in granary, the bulk of which is of secondary and inferior descriptions. In Holstein wheat of 62lbs to 63lbs, remarkably fine in colour and condition, may be bought at 21s 6d to 22s; in Mecklenburg at 21s 6d to 22s 6d. High mixed Danzig wheat was offering at 27s 6d to 28s 6d, but owing to the shortness of the supplies has now advanced to 29s and 30s. Towards the close of the month, the trade again relapsed, and prices closed heavy; the finest wheats barely maintaining their previous quotations, and good qualities receding 1s per qr, while secondary and inferior hung on hand at a reduction of 1s to 2s. This inactivity and retrograde movement in the market has principally arisen, from the favourable state of the weather, and few complaints being now made on the part of

the farmers as to the appearances of the growing crops; and as the stocks of old wheat are still large, millers have only bought sparingly, not being apprehensive of any falling off in the arrivals, and consequently little advance in price to be anticipated.

The opening of the Spanish ports, led to a partial enquiry for bonded wheats, but the prices demanded were generally too high to meet the views of speculators. A few parcels of inferior hard wheat obtained 26s to 28s, and Kubanka realised 32s; for about 1000 qrs of this latter quality of wheat 27s, was offered to ship to Australia.

The arrivals of flour have been liberal, but at the beginning of May, the article was in request and good fresh ship qualities obtained 1s per sack more money; the dulness however which pervaded the wheat trade, operated on flour, and sales became heavy, particularly of parcels on the wharfs, which might have been bought on rather lower terms. A few parcels of sour flour in bond have been sold at 16s to 18s per barrel.

The duties on wheat have advanced 1s per qr, being 48s 8d: on barley, 1s 6d; and have declined on oats and rye 1s 6d per qr, respectively.

The importation of English, Scotch, and Irish barley has been on a very moderate scale, and though the demand for malting descriptions has been limited, owing to the malting season drawing to a conclusion, yet the trade has been principally supplied from foreign supplies, which continuing to work well, realised from 31s to 32s; prime, 33s to 34s. At the close of the month, maltsters having completed their purchases, prices receded, and the best descriptions only obtained 32s; Norfolk and Suffolk remaining nominally at 33s to 34s; and Chevalier at 37s to 38s. Previous to the advance of the duty on foreign barley to 15s 4d, the duty of 13s 10d had been paid on 55,000 qrs, consisting almost entirely of Danish and Holstein quality; about 17,000 qrs of which were sold direct ex-ship. In consequence of the continued import of Scotch and Irish spirits, the demand has been checked on the part of our distillers, and distillery samples have been heavy of disposal; grinding sorts have been in request, and fully maintained their former quotations; the inferior Irish samples, however, have hung heavily on hand.

The malt trade has continued heavy, and maltsters evinced more disposition to quit their stocks, and latterly prices have receded 1s per qr; the secondary descriptions have at times proved ready sale.

The supplies of Oats from Ireland have continued considerable, and since the 25th of April have amounted to upwards of 73,000 qrs, and though the arrivals from England and Scotland have been very moderate, yet, the number of Irish samples offering, and the late beneficial rains, having caused speculators as well as dealers to anticipate improved crops of hay and fodder; they have held off from purchasing, unless at lower rates; and prices have receded during the month full 1s 6d per qr on Irish qualities; but English and Scotch descriptions have suffered little depreciation in value. Towards how-

ever, the close of May, factors became more firm, owing to the continued sale, and particularly the extent of the country demand, and prices remained firm, with a tendency in the currencies rather to advance than further decline. Oats have been in request on the Irish Coasts, especially in the Southern ports; free on board prices remaining steady at 13s 6d to 14s; Galways, 12s 6d to 13s per barrel. By the account annexed of the import of oats into London for the last five years, from the 29th of September to the 15th of May in each year, the large increase in the receipts from Scotland and Ireland, as compared with previous seasons, would lead to the conclusion, that as the late crops were by no means abundant, and that though the Irish supplies may have hitherto proved adequate to the deficiency from our coast, yet, however prolific the sister island may be, there are bounds to her power of productions, and that there must be less left in the hands both of Irish and Scotch growers and shippers than usual at this season of the year, and we may therefore anticipate a material falling off in the future shipments, and that before another harvest, we shall be forced to have recourse to foreign importation to meet the necessary consumption.

| 1833 — 1834          | 133,613          | 161,884         | 331,416        |
| 1834 — 1835          | 56,657           | 227,728         | 547,610        |

Some speculative attention has been directed towards oats in bond, and several purchases have been effected in Sweden, Denmark, Jutland and Friesland, for English account; and prices have again advanced abroad 6d to 1s per qr. Fine fresh cargoes which have arrived, have been offering at 16s to 18s, but speculators generally have not acceded to these rates, and most of the arrivals have gone into granary without changing hands.

Beans, the demand for which is always more or less influenced by that of oats, have been in request, and advanced 3s to 4s per qr; good round ticks being worth 41s to 42s. The article in bond has also improved, and is held at 24s to 27s, as in quality; fresh purchases have likewise been effected abroad, where, however, the stocks have become, generally, very much reduced. The duty at present is 15s 6d.

Peas have latterly met with more request, and some purchases have been made for horse feed. Prices have sustained little alteration, as the duty of 16s 9d is too high to allow any further admission of foreign qualities.

During the month, from the 25th of April to the 25th of May, the following quantity of grain and flour has arrived in the port of London:—

|              | Wheat.<br>Qrs. | Barley.<br>Qrs. | Oats,<br>Qrs. |
|--------------|----------------|-----------------|---------------|
| English .... | 25,188         | 2,644           | 6,823         |
| Scotch ....  | 287            | 1,388           | 16,041        |

The reports as to crops in France represent the young wheat plants generally to appear vigorous and luxuriant, the late frosts having not proved detrimental to their growth; oats have suffered from the drought, and are maintaining a high range of currency, the price of the article being also influenced by the deficiency of fodder, and unpromising state of the meadows, which, from want of rain, will, for the most, yield a very short return of hay: artificial feed, in places, has likewise received injury from the cold. Rape plants, in many districts, have also suffered from the frosty weather. At Paris, wheat supports its previous rates, in consequence of the limited stock on hand in those districts from whence the capital is accustomed to draw the bulk of its supplies. From Bray, and all the markets on the course of the Upper Seine, and the Aube, as well as from Chartres, Chateaudun, and many other leading marts, not much more than half the amount has been received, which had arrived at a similar period last season. If, therefore, the supplies should fall off from the northern departments, no doubt, a rapid and extensive improvement would ensue in time. Refreshing rains having been experienced in different parts of the country, and the rain in the neighbourhood of Paris having set in with the new moon, had caused a depression rather in the minds of holders of oats, and the article might be bought on somewhat lower terms, and should supplies come to hand, a decline in the quotations was looked forward to, though in many of the country markets oats continue to advance, owing to their scarcity. The upper districts of the Rhine may have experienced severe weather for the season of the year, accompanied with a heavy fall of snow, but vegetation does not appear to have suffered any detriment; the fields from the Duchy of Baden to Strasburg, thence to Carlsruhe, as well as in Alsatia, present a satisfactory appearance. The wheats, though not extremely thick, are clean, and strong in the blade; and the rapeseed is in full flower. At Marseille some degree of animation has pervaded the market, owing to the demand for wheat for the southern parts of Spain, and the bonded warehouses are nearly cleared of their stock of hard wheats; merchants, however, do not seem inclined to make further shipments, as they fear the quantity required by the Spaniards will be more than met by the consignments from so many different quarters. At Lyons, and in the neighbourhood, prices are no longer declining. In Alsace wheat will be very dear; unless supplies are furnished by Lorraine, from whence the wants of Paris and Strasburg are sometimes provided. In the western departments, however, the heaviness of trade is mostly experienced. The produce of the last year's crop appears to have been very unequally distributed, and the markets generally as much shorter in supply, and the stocks

much more diminished than at the same period in 1834. The state of business, therefore, mainly depends on the weather and the prospects of the crops for the next two months. The averages, which the previous season caused little interest in the opinion of the trade, may now produce a movement of an important character to the consumer.

By the latest advices from Spain, the prices of wheat materially advanced in Audalusia, Catalonia, and Arragon; the scarcity of corn which had prevailed in these provinces, added to the fears inspired by the continued drought as to the fate of the forthcoming crops, instigated the Government to permit the import of foreign wheat into the ports of Cadiz, and Malaga. The quantity however to be admitted was very limited in amount; at Cadiz not exceeding 6,000 to 7,000 qrs; and no additional import at present anticipated; and at Malaga only 15,000 fanegas and the order at the latter port has been since rescinded, a Greek, a Sardinian and two English vessels having only been fortunate enough to procure admission for their cargoes; good hard wheats are those which have been much sought after by the Audalusians, and inferior qualities, as being the cheapest, by the Catalonians. As shipments have been made from the Baltic from Hamburg, England, Italy the French Mediterranean ports, and those in the Bay of Biscay from Gibraltar, and even Morocco, most of the supplies will be excluded. Wheat freighted in Spanish vessels was to be entered free of duty, and shipped under a foreign flag a duty of three *reals de vellon* per fanega was exacted.

In the Black Sea quotations of wheat have, since Autumn, evinced a continual tendency to decline, the prices of soft qualities ruling low. At Odessa, the article is to be purchased at 23s to 24s 6d, the stocks of hard descriptions being less, and more in request; currencies are higher, being noted at 27s 7d to 30s 2d; but a further reduction is confidently expected on arrival of the supplies from the interior of the country. A deficiency having been experienced in Spring corn, several imports of barley and pulse have been received from Smyrna and Egypt, as well as, strange to say, Oats from Northern Europe, but as the demand of these articles is only limited, it is much to be doubted, if these shipments have been attended by any very satisfactory result. The weather is stated by the last accounts, as being very genial for all agricultural operations.

At Naples, Leghorn, and Genoa, the wheat trade, has been in an animated state, owing to the purchases which have been effected, and the shipments made to Spain; and though the prices have not undergone any material improvement, yet at Naples soft wheat was firm at 26s to 27s; and hard qualities at 27s to 28s; new soft descriptions for delivery in August, were held at 30s. Barletta and Ancona wheat was not to be procured under 27s, at Leghorn, and the better samples of Hamburg and Baltic wheats were obtaining the same quotations. At Trieste the demand was confined still to the consumption, and as the weather continued favourable for the growing crops, prices were on the decline, with the exception of those of barley, which had been bought for shipment to Lisbon and Algiers, and was noted at 15s 9d to 20s 6d. Oil seeds were more in request and advancing in value, as the crops in Lombardy and Hungary were reported to have suffered.

At the Russian ports prices of grain have remained stationary, and as the Government had again taken upon itself to provide for the wants of St. Petersburg and environs, the trade very prudently had refrained from operating, not wishing to come

into competition with so dangerous a rival. Linseed continued in request, and Morschansky qualities had advanced to 44s 1d; the export of the article generally will, it is reckoned, amount the ensuing season to 200,000, or 225,000 tschets. At Riga, the prices of Linseed remained at 44s 3d to 48s 5d.

At Danzig, the prevailing opinion seems to be that no supplies from Volhynia are to be expected this season, the waters of the river Bug being too shallow to float the barges; and the accounts of the state of the less important rivers of Upper Poland, as the San, the Wiepez, &c. are much the same; thus leaving only the shipping towns on the Vistula, from whence supplies can be depended upon; these places it is computed may furnish 30 to 40,000 qrs of wheat, but owing to the high prices at Cracow and Warsaw, in part caused by the dearth of Summer corn, it is probable that a considerable portion will find its way to these markets, and that hence, unless a material advance takes place in price, to admit of transit being forced over land, the total supplies for Danzig will not exceed 30 to 40,000 qrs. In consequence of the reports being received, that agents from Berlin and its neighbourhood had bought up the main part of the supplies which were on their way to Danzig, prices had advanced 1s 6d to 2s per qr; fine high mixed had realized 30s, good ditto, 28s 6d, and mixed sorts, 26s 6d. An additional reason for encouraging the holders to demand higher rates was the advance in the currency of rye, which was gradually improving, and 25s had been paid by the consumers, exhibiting a rise of 3s per qr during the past month. Rye and Peas were also in request for the central country markets, and it was generally anticipated that the stocks in bond would be liberated for the consumption free of duty, which may be calculated as making a difference of 3s per qr. In some of the Vistula districts rye obtained 26s, and peas, 30s to 34s. Some craft also had loaded wheat for Berlin, and sales had been effected for Pomeranian account. At Konigsberg prices remain unaltered. At Stettin wheat was held at 23s to 24s. In Mecklenburg supplies of grain at the principal markets were short and prices nominal; wheat was noted at 22s 6d; barley, 16s 3d; and oats, 13s. The appearances of the young winter sown corn were satisfactory, and those of spring corn very favourable. In Holstein an improved demand had been experienced for wheat, and sales had been effected for shipment to the Mediterranean and Spain, both of old and new qualities, prices being firm at 22s; barley, 16s; best heavy oats at 14s 6d, and the stocks of both these latter articles very limited. The rape plants in Holstein and Denmark had much improved, and in some districts a tolerable crop was anticipated, though in others the farmers are complaining of an increase of vermin and insects, and apprehend that the produce may not be larger than last year; but the weather was warm and genial for the growing crop. Old Danish barley had been bought at 12s 2d to 12s 9d, chiefly for Norway. Danish Oats were steady at 12s; Swedish, at 11s to 12s; black Oats on the west coast of Schleswick and Jutland, 12s. At Hamburg more demand was being experienced for wheat, which had advanced during the last three weeks about 1s 6d per qr, best Mecklenburg, of 60½ lbs, was noted at 27s; Marks, of 62 lbs, 26s 9d; Holstein, of 62 to 63 lbs, 24s 9d to 26s. Barley firm; offers were making for new Danish quality, weighing 53 lbs, at 13s 9d. The price for oats was again steady, and quality of 38 to 42 lbs were held at 11s 6d to 12s 6d, and 13s; Swedish, of 38 to 39 lbs, 11s 6d to 12s. Small Beans, 22s 6d; large do, 21s.

# THE POLITICAL COMPANION

TO

## THE FARMER'S MAGAZINE.

### POOR LAWS.—IRELAND.

(From the Times.)

The grand accompaniment of every other Irish evil is the misery of the labouring poor. It was plain that Catholic emancipation would do nothing for that. It would raise the gentry to their just political privileges, but it would not relieve any man from nakedness or hunger. The consequence has been, that poverty in its strict sense—that is to say, the want of absolute necessities, such as food—not merely that of comforts, as in England,—has prevailed among the Irish to a degree unexampled, we verily believe, in any other European region; for it is not merely in a direct manner that the absence of a well-regulated poor law in Ireland has operated to the continuance of destitution, it is not merely that hunger has not been relieved, but that want in no shape has been prevented. The landlords are not only not compelled by law to give one farthing towards the alleviation of misery where it has already actually overtaken its victim, but they are not warned by the fear of any legal compulsion, to avert its occurrence, by the slightest care on their on their own parts, exercised with a view to the future advantage of their humble neighbours. When the poor candidates for an acre of ground on lease are driven by desperate competition to offer three times the rent that can ever be made of it, what would be the influence of a poor law upon the conduct of the landlord? He would calculate the rent which a tenant could afford to pay, and select for the occupation of his tenement the most industrious and reputable husbandman. Such a landlord must know very well, that the man who promised more than he could pay could never pay what he promised, and would therefore, in his consequent state of pauperism, become a burden on the parochial poor rates. This would give the landlord an immediate interest in the comfort and independence of the poor about him. The poor man's wages would be raised by it, while his rent would be lowered, and with a smaller nominal income the proprietor would be in reality a richer man. But at present the Irish are treated more like beasts of the field than human creatures. They have been stimulated and encouraged by the landlord, while it served his political interests, to settle as *freeholders* on the estate. They have multiplied in the midst of privation. At length it was manifest that the land was overstocked—and what then? Had poor laws existed, the land must still have fed the poor who had been settled on it, after they had ceased to be its tenants; but without poor laws, and for want of them, the surplus tenants have been unhoused and banished, without a place to lay their heads in, a rag to cover them, or a potato to eat. Never was such a wholesale destitution witnessed in this world. The law gives no redress

and no protection. The landlord has exercised, correctly speaking, no more than the right of property secured to him by the barbarously defective condition of the law, and thousands under the vindication of that right have perished. This state of things we have often said must be put an end to; and if Mr. O'Connell follows up the question with a perseverance equal to the zeal with which he seems to have opened it, or sees it in the same clear light in which the late Dr. Doyle presented it, we have no doubt that the object will be gained. When it is in contemplation to take a large proportion of its annual revenue from the church for the benefit of the landlords, it would be too audacious in the latter to reject the supplications of the poor. But Parliament, we hope and trust, will soon entertain that feeling upon the question which humanity and justice inculcate upon a Christian Legislature; nor should any complaint be listened to of the sacrifice which such an alteration of the law would entail upon the Irish landlord; half the rent of his estate would, even considering no interests but his own, be a cheap price for the many direct and collateral blessings thus (morally) ensured to society.

### THE CURRENCY.

(From the Herald.)

Our opinions upon that vital question “the currency system,” have been so often before the public, that we did not intend, for the present, to resume the discussion upon that question. We have, however, some reason to know that the public mind is gradually awakening to its importance; and in the numerous agricultural associations of the country it is becoming the principal topic of discussion. The agricultural interests, for the present, have lost the remission of the malt tax, which, it is generally admitted, would have proved but a partial relief, without, also, some immediate amelioration of our vicious monetary system; and this has particularly led into general inquiry upon the subject. The monthly returns in the *Gazette* of the average liabilities and assets of the Bank of England are also incontestable evidences of the fallacious character and danger of the system, and each succeeding return adds force to the dawning conviction of the people. Under such circumstances, we cannot be silent, and, though our opinions are known, it would ill become us to slumber.

We have ever advanced those opinions under the full conviction that most of the evils under which the agricultural and manufacturing population have long—much too long—suffered, are to be ascribed to the evils inflicted upon them by the operation of Mr. Peel's ill-fated Bill. We think so still; and those opinions are supported by the most

experienced men in the monetary world. The late Government have reiterated the admission from the throne, that the agriculturists were in great distress; yet they and their predecessors have shunned the question. Both parties have been aware how difficult it was to attain a just knowledge of a question so abstruse and intricate; and falsely relying upon the ignorance of the major part of the people, and the slow progress they must make in acquiring a true knowledge of the subject, they have obstinately persevered in a system that screws down all the industrial energies of the people. We have resumed the subject, because we consider that every man who endeavours to enlighten his fellow-countrymen upon questions so important deserves infinitely more honour than the leader of a political faction; and we are convinced that he will, in the end, be the cause of creating an infinitely greater sum of human happiness.

In this spirit, we call the attention of our readers to an unpretending, well-written pamphlet upon the currency question, now publishing by Cochran, of Waterloo-place, entitled—"A Second Address to the Agriculturists of Bucks," by a Gentleman connected with that county. It is evidently the production of a man of experience, and imparts some convincing truths in language adapted to the humblest capacity. We believe we should only garble the pamphlet were we to make copious extracts from it, but there is something so convincing in the following short and plain table that we cannot resist subjoining it and the short remarks which follow:—

|                                                                                                                                     |              |
|-------------------------------------------------------------------------------------------------------------------------------------|--------------|
| The National Debt in 1793, when the war commenced was .....                                                                         | £244,440,000 |
| Contracted from 1793 to 1797 ..                                                                                                     | 129,560,000  |
| The total amount of the National Debt contracted in Gold up to 1797 (when the Bank Restriction Act took place), was therefore ..... | 374,000,000  |
| Of this sum there was redeemed in Gold—                                                                                             |              |
| From 1793 to 1797, 14,000,000l.                                                                                                     |              |
| From 1820 to 1827, 119,000,000l.                                                                                                    |              |
| From 1827 to 1830, 21,000,000l.                                                                                                     | 154,000,000  |
| Leaving at this moment due in Gold .....                                                                                            | £220,000,000 |
| The Debt contracted in Paper Money from 1797 to 1819 (when the Bank Restriction Act ceased) was .....                               | 988,000,000  |
| Of this sum there was redeemed in PAPER .....                                                                                       | 370,000,000  |
| Leaving at this moment due in Paper .....                                                                                           | £18,000,000  |
| Total National Debt in Gold and in Paper .....                                                                                      | £838,000,000 |

"Thus it will be perceived by the foregoing statement that of the total debt now due *three-fourths* have been contracted in a *depreciated* currency, and, legally and morally speaking, payable only in *paper*—yet was it converted in one hour by an Act of Parliament into a *metallic* or *gold* debt! The mind shrinks back at the very contemplation of such an act of injustice—an injustice not to be paralleled in the annals of the civilized world. Who can predicate the portentous consequences of persisting in an endeavour to convert upwards of 600 millions into an equal sum in gold, at a low fixed standard value?"

We quite agree with the writer. Who, indeed, can predict the consequences of pursuing such a cruel system; one which, if persevered in, will certainly increase the power of our domestic demagogues; and, as it must gradually cripple the national resources, will also embolden the foreign

enemies of the State. We know the bullionists entertain a good deal of mock fear about returning to the old system; their constant cry is, "*it is too late to go back.*" But "*Sera nunquam est ad bonos mores via,*" and the sooner we retrace our steps in the monetary system of the country the better. With the full conviction that no Government who intends well to the country ought to shirk the question, we shall, on every opportunity, endeavour to draw their attention to it, and impress upon the country the necessity of an immediate investigation into the nature of the present system.

## DUTCH AGRICULTURE.

(From the Courier.)

The emigration of substantial farmers from Holland to the United States, is beginning to excite some notice in the Dutch Papers. That it should take place can scarcely cause surprise, when agriculture is in Holland, as in England, in a most ruinous condition, and is flourishing in the United States. In the latter country, as we read in one of the American Papers a few days ago, capitalists were netting, in some cases, fifteen per cent. half yearly upon some speculations. The interest of money in America is, no doubt, much higher than here, and as its wants have been supplied from the European markets, that has contributed to raise the interest of money here. It was stated yesterday that an expectation prevails in the city that the Government and other great borrowers will have to pay a higher rate of interest for their floating securities. But the depression of agriculture in almost every part of Europe is a convincing proof, that, for the moment, this increase of the rate of interest is not caused by any increase of profit arising from the cultivation of the soil in Europe. To us, then, this rise in the interest of money seems likely to add to the difficulties of our agriculturists, and we embrace the opportunity of saying a single word on the effect of restrictions on the trade in corn in producing results so disastrous to those who have obtained them on the supposition that they must be beneficial to themselves.

The restrictions on the Corn Trade are imposed on the supposition that Corn is here in abundance. There is so much of it grown in Britain, that our farmers, if possible, will have none imported. Those restrictions are not intended to clog the growth of Corn here, but to impede and clog its importation. Corn is too abundant and too cheap; and there can be no motive for extending cultivation. Enterprize in this branch of production must be asleep or dead. Abundance and cheapness, however, are relative terms; and Corn is abundant in relation to consumers, and cheap in relation to the quantity of money in circulation. But the Corn Laws are restrictions on the manufacturers of cloth here, who would be able to sell more on the Continent if there were no Corn Laws. They are a restriction on our shipping, which would be employed to a greater extent than at present in importing Corn, if there were no such laws; they are a restriction on enterprize in those branches of trade where men pant to be free, and to extend their operations; and thus they operate to check the increase of people engaged in manufacturing and commercial industry. Without diminishing the quantity of Corn grown in the country they lessen and impede the demand for it.

But the manufacturer, and the ship-owner, and the merchant, who find their enterprise impeded by the restrictions, must as a matter of course, check all their speculations, and not issue so many of those bills which now figure so conspicuously in our circulating medium, as they would issue were there no such restrictions. The Corn Laws, then, diminish the amount of money in circulation. They make Corn cheaper both by raising the value of money and lessening the demand. Trade and land have been aptly compared to twins, which wax and wane together, and, old and apt as is the comparison, never was it so much lost sight of as by our agriculturists. During the war, great as was our trade, land shot a-head, and it was the business of the Legislature to allow trade to overtake it. But the Corn Laws are really a restriction on trade. They check the growth of the twin-brother of land, and land itself suffers dreadfully, and will suffer as long as its companion is kept from attaining its natural stature and strength. The Corn Laws are bounties on the growth of corn, and restrictions on the increase of consumers, and of their means of buying corn. Benevolently intended to benefit the farmer, they are affecting his pecuniary ruin and his moral degradation. It is another proof of the fact that no man or class ever fell into error, or committed wrong, without suffering from it.

#### ABOLITION OF IMPRISONMENT FOR DEBT.

(From the Herald.)

We formerly argued that the law was detrimental rather than advantageous to the fair and honest trader and shopkeeper, because it induced a system of false credit, which produced more apparent than real custom—a custom always unsound—often ruinous both to the trader who trusted, and the purchaser who, by such facility of credit, was tempted to live beyond his means. In the little work to which we have alluded, and which is stated to be from the pen of a “Barrister of the Middle Temple,” there is some cogent reasoning upon this part of the question founded upon practical observation. We quote the following passages. The object of the writer is to show that, by the abolition of arrest for debt, what is lost in custom would be gained in soundness of credit. He says—“Able at any time to imprison his debtor, the creditor is always on the alert for custom. His eagerness encourages purchasers—he considers the certainty of recovering his money by enforcing the law—they calculate the probability of paying from their expected resources. Accustomed to the aid of the law for protection against the person of the debtor, he is not active in adopting precautions respecting the property. He trusts without due inquiry, and is imposed on by appearance. Every inducement is thus afforded to a class of adventurers, who speculate upon the possible chances rather than the ordinary courses of trade. To such persons success is profit without outlay, and insolvency a passport to the privileges of the law. Meanwhile the creditor extends his connection—orders are multiplied—he displays a large assortment of splendid stock—has crowded counters, and a long list of bad debts—he must, however, supply the deficiencies—at last he is driven to dispose of his goods at any rate—to deceive the public by puffing, and to injure the trade by underselling. The shops are full—so are the gaols.”

By disarming the creditor of a power which he

has overrated, he will appreciate the value of self-protection. In commerce the magnitude of its concerns creates caution. The success of the merchant is promoted more by his own exertions to preserve credit than by any legal enactments to protect it. So the tradesman will learn to exercise greater prudence—he will look less to chance gains than to certain profits. Thus the discontinuing of the arrest will check unwarrantable confidence, and discourage a system of unprofitable speculation.”

The writer then proceeds to show that the increased power to be given by the law to the creditor over the property of the debtor will be far more than an equivalent for the abandonment of the power over the person, which is oftener the means of gratifying a vindictive feeling, to which the law should never minister, than of affording protection. With regard to the effect of imprisonment upon the debtor he says—“Imprisonment is more to be deprecated in the instance of an honest man, than desired as a punishment even for the guilty. It deteriorates the debtor—diminishes the chances of the creditor, and operates injuriously on public morals. If the debtor have property, it impoverishes him by legal demands and prison disbursements. Had he skill or industry, he is incapacitated for exertion—he can earn little for himself—nothing for others. Had he position in society, influence and friends, he is degraded—had he character, that is destroyed—had he honesty, expectations and prospects in life, which are often the creditor's last chance, even that is endangered by a course which leads to the demoralizing of principle—the hardening of the heart—the extinction of the last ray of hope.” The evil consequences of imprisonment for debt are here strongly portrayed; but the force of the picture is in its truth.

#### THE CHURCH OF ENGLAND.

(From the Morning Post.)

The ministerial journals exhibit, more clearly than they intend, the character and objects of the party whom they represent when they labour to vindicate and consolidate the alliance between Protestant dissenters and Papists for the overthrow of the Church of England. People of reflection and intelligence will conclude, without hesitation, that the objects cannot be good which are sought by means so vicious and unnatural. “It is a most unquestionable truth,” says an evening Whig contemporary, “that the grievances of English Dissenters have invariably been owing to their Protestant not to their Catholic brethren. It is also true that in the reign of the last Stuarts the dread of Popery in the minds of the Protestant Dissenters, which had then some reason, was shamefully taken advantage of by the Church party to obtain their assistance against the Papists, and then throw them overboard, nay, visit them with active oppressions. But at the present day the Dissenters are completely aware that they have a common cause with every other oppressed denomination; and they remember, besides, that the Catholic support was not wanting to the repeal of the Test and Corporation Acts. It is quite in vain to attempt to delude the body of Dissenters with the antiquated cry of ‘No Popery!’”

We have here a choice specimen of the artifices by which political Dissenters—that is to say, men who pretend to be Protestant Dissenters in order to promote more effectually their political views—impose upon the understandings of their more simple-minded and sincere brethren. While the Roman

Catholics had power in this country there were no Dissenters in the sense in which the term must now be understood ; or, to state the fact more correctly, the Protestants who subsequently formed the Church of England and those who subsequently became Dissenters from that Church were, during the period to which we refer, one undivided body. The Dissenters suffered then in common with the whole Protestant body. Will the honest and conscientious Dissenters of the present day deny this? Will they patiently permit it to be denied on their behalf? Are all the glories of the Reformation—all the heroism which that great moral and intellectual convulsion produced—all the magnanimous suffering, the constant devotion, the indomitable zeal—all the merit of enduring torture and death, unvanquished and unappalled, in the pure strength of conscientious conviction, and in Christian reliance upon the great author and finisher of our common faith, to be denied to the predecessors of the Protestant Dissenters of Great Britain? Is this a portion of the annals of England from all share and participation in the glory of which the Protestant Dissenters of the present day are willing to be excluded by the stupid and perverse, the unjust and ungenerous, reasoning of men calling themselves their friends and advocates? Will the Protestant Dissenters adopt the argument of their pretended friends, and concede to the Church of England the exclusive merit of having struggled with Popery when Popery was in possession of political power—of having braved its authority, endured its persecutions, and subverted its dominion! For this is what the political Dissenters really concede when they assert that “the grievances of English Dissenters have invariably been owing to their Protestant not to their Catholic brethren.”

And what grievances have English Dissenters ever endured from their Protestant brethren beyond what was necessary to keep together the body of the Church, and guard effectually against the restoration of Popish dominion? We do not admit that they have endured any, nor do we affirm that they have endured none. What we ask is, that the amount should be fairly summed up; and that it should be regarded in conjunction with the circumstances of the times, in which each particular grievance was inflicted, and with reference to the necessity of guarding against Popery as a powerful enemy, and the impossibility of viewing the Dissenters from the Church of England as steadfast friends? For a considerable period the Church of England had in its charge (and has it not even now, in its charge?) the duty of protecting the Ark of the Protestant faith in Great Britain. And this duty it discharged in a manner so efficacious, with respect to its main object, and so free from intolerance to the conscientious Protestant Dissenters, who weakened and embarrassed it during the vital struggle in which it was engaged by their separation from its fold, as to have acquired a claim not merely to exemption from reproach, but, we will boldly say, to the everlasting gratitude of every conscientious Dissenter, of whatever denomination.

“The Dissenters are completely aware,” we are told, “that at the present day they have a common cause with every oppressed denomination,” and that it is quite in vain to attempt to delude the body of Dissenters with the antiquated cry of “No Popery.” What we want to know is, where any such thing as an oppressed denomination is now to be found, unless it be the Protestant clergy and people of Ireland? The former have been indeed inveigled by the State into a position in which the State, under the dominion of Roman Catholic councils,

leaves them to starve unassisted. The latter may not manifest any active sympathy with their oppressed pastors, but at the risk of being robbed and murdered by the O’Connell faction, the organised array of Popery, now assured of impunity, inasmuch as they are the indispensable auxiliaries and the imperious rulers of the actual government of Great Britain. These are the oppressed, and the only oppressed, denominations among the whole body of his Majesty’s subjects. And it is with these that the Dissenters, if they had any just sense of right, or any well-considered regard for their own interests, would make common cause.

The Protestant Dissenters, whatever may be their present feelings, will soon, we suspect, begin to perceive that the “antiquated cry of ‘No Popery’” would be the instrument of a much less dangerous delusion than the pretence, that, from the increase and aggressions of Popery there is no longer anything to apprehend. Let the Protestant Dissenters look at the growth of Popery in Great Britain within the last six years; let them look at the influence which, at this moment, a confederacy of Papists possess in the House of Commons; let them look at the grounds for suspicion that an active, able, and ambitious Papist, exercises a secret and undefined authority over the King’s government; let them regard the Papists in the legislature, voting and acting in direct violation—we will not say of the oath which they take on their admission into Parliament, for this is a disputed matter—but in direct violation of the sense in which that oath was understood by all parties, by the advocates for the Emancipation Bill, by its opponents, by the Popish leaders themselves, six years ago, when it was introduced into the body of that Act for the protection of the Protestant Church. Let the Protestant Dissenters look at these things, and they will not, we imagine, fail speedily to discover that more mischievous delusions may be practised upon them than any that can be couched under what is called “the antiquated cry of ‘No Popery.’”

#### THE OATH OF THE ROMAN CATHOLIC MEMBERS.

(From the Times.)

Public attention being at this moment turned with so much earnestness to the subject of the oath taken by Roman Catholics under the bill of 1829, on their admission to sit in parliament, we have looked over some discussions relating to that oath, which arose out of a motion of Mr. O’Connell, on the 11th of March, 1834, of which the aim was to bring about through the appointment and report of a select committee, an abolition of the aforesaid oath.

Now, that oath, which pledges Roman Catholics against attempting anything to the injury of the rights, privileges, or property of the church establishment in either island, was framed expressly, and universally understood to be intended by the legislature, as a security for the Church of England and Ireland against an abuse of the powers conferred upon Roman Catholics by the act of Catholic emancipation.

As the oath was to be taken by Roman Catholics exclusively, so must it have been designed to restrain Catholics exclusively, and not Protestants, in the exercise of the new functions wherewith they were invested by the bill. It could not have been intended, because it was wholly unnecessary to get up the apparatus of a solemn oath, as an instrument for deterring Roman Catholics from meddling by violent or unlawful means with the rights and pro-

party of the Church Establishment. The law was already strong enough to punish any such illegal—that is criminal—attacks upon the Protestant Church. An oath, by which a man engaged himself not to violate the law which upheld church property, would be as absurd as an oath against the perpetration of highway-robbery. The penal sanctions already existing are sufficient for the general prevention of such misdeeds.

The oath, therefore, if to be regarded as a security, must contemplate a restraint upon Roman Catholics in the exercise of the legal powers conveyed to them by the Emancipation Bill, so as to guard against a perversion of those powers to the overthrow or injury of the Church Establishment. The object of the legislature manifestly was not to prevent a usurpation of authority, which from the nature of things it would be impossible for Roman Catholics to accomplish, but the abuse of a political trust, to which the spirit of their church and their sectarian jealousy or hatred of Protestantism might naturally tempt them.

It was on this view, and under this persuasion, that Mr. O'Connell, on the day of the last session alluded to, gave way to his impatience at the yoke which he secretly felt to be thus imposed upon his machinations against the Protestant Church of Ireland, by moving for a Committee to get rid of it.

The learned malcontent went, as usual, somewhat cunningly to work. He asserted, that "the Catholics in the House of Commons ought not to be placed in an invidious light. No, to be sure,—they ought to have full liberty to stab our Protestant constitution with the weapons which it confides to them. But the learned person further said, and repeated through half a dozen sentences—that he, as an individual taking that oath, ought to be bound by its plain meaning, and not by any arbitrary construction which he or others might affix to it. Yet all this show of candour will not go for much, when it appears in a subsequent passage that the learned Jesuit has ready cut and dry a construction of the oath, dexterously accommodated to his particular projects; and, as we Protestants may be disposed to think, sufficiently arbitrary likewise. Mr. O'Connell being a stickler for liberty of conscience, allows his own no niggard measure. He assures the house that "he could take the oath with a safe conscience, and with the most perfect regard to the religion he professed." And well indeed he might, and with extraordinary satisfaction moreover. Why? "Because there was nothing in the oath to prevent a Catholic from acting as he pleased with respect to the temporalities of the Established Church, either as regards the power, authority, or emoluments of that church!" This may be highly satisfactory to the learned Repealer. He may have flattered himself that he could hoax the House of Commons by such a mystification of the plain terms of an oath binding Catholics not to do anything which might weaken or injure church property or privileges, as would still admit of their acting how they pleased with her temporalities, by robbing her, for instance, of every sixpence of revenue that had ever belonged to her. Very convenient this, no doubt, and prodigiously gratifying to those of the learned casuist's hearers who had flattered themselves with the notion that any oath, or any bonds, however strictly and perspicuously worded, could be available securities against Punic or Polish faith!

Sir Robert Peel treated this morality with a gentleness and delicacy somewhat surprising, as he evidently detected the lurking mischief. He, how-

ever, reminded the learned anti-Saxon, that it was no more than five years since the act of emancipation had passed, that the oath in question was embodied with that act as a security—the only one demanded by a Protestant nation, which had at the time the power in her hands to impose what conditions she might have deemed most necessary—and hinted that it was neither the most modest, nor the most grateful, nor most prudent thing in the world to importune parliament at so early a period after so vast a favour had been bestowed upon the Catholics for a removal of the single guarantee against the abuse of it which Protestant liberality had acquired.

Sir Robert Peel added his own apprehension that parliament might be induced by such conduct to withhold all liberal concession from those who asked it. But, for our parts, if the securities be swept away, we shall wonder if the Protestants do not require that the *danger* too—meaning the privilege against the abuse of which those securities were framed—shall also be removed by act of parliament. The Union with Ireland is not the only great political settlement of which revolutionary exigencies may bring about the repeal. The "settlement" of 1829 is not one whit more sacred.

## O'CONNELL AND THE MINISTRY.

(From the Morning Post.)

"There is not a single Tory in office, and, by the blessing of God, there shall not be a single Tory in place either."

The above is an extract from Mr. O'Connell's last speech to his followers in Ireland; and we have to announce to the public to-day, that, in conformity with the mandate herein issued—

1st. Lord Heytesbury's appointment to India is cancelled.

2ndly. Sir Howard Douglas has been recalled.

3rdly. Lord Amherst's appointment is suspended, preparatory, we believe, to its being finally cancelled also.

Now, we entreat our readers to compare these facts with the announcement made in Mr. O'Connell's speech, "that, by the blessing of God, there shall not be a single Tory in place, either;" and, we ask them, is it possible to believe that this man, however *officially unconnected* with the government, is not in point of fact the *dictator of its measures*—or whether Mr. O'Connell, however disowned as a coadjutor by Lord Melbourne, is not, to all intents and purposes, a *member of his Cabinet, and his colleague in the government*?

We entreat the people of England to compare this, the first act of the new Premier, with the conduct pursued by Sir Robert Peel on similar occasions, on *his* accession to office, and to ask themselves the question, is any, the least, credit to be attached to the declaration so often repeated by the organs of the administration, that "there is no understanding whatever between Mr. O'Connell and the King's government."

We shall not now enter into a lengthened consideration of the question of Lord Heytesbury's recall. We believe we may assert, without fear of contradiction, that there existed on all sides but one opinion as to that nobleman's fitness for the office to which he was nominated by Sir Robert Peel. The appointment was received even by the Whigs themselves as one against which it was almost impossible to find a single objection; and we know that it was viewed in this light by the

Court of Directors, and for that reason was unanimously confirmed by them. Yet here is the appointment of Lord Heytesbury cancelled, on the eve of his departure for his government, and after he had received the usual allowance for his outfit from the East India Company, without the shadow of a complaint either as to his incapacity to discharge the duties confided to him, or the pretext of any single act committed by him to disqualify him for the office for which he was selected by his Sovereign, and by the unanimous approbation of the East India direction.

The same reasoning may be applied to the conduct of the government in their recal of Sir Howard Douglas, and in their suspension of Lord Amherst.

We shall return to the consideration of these measures of the new ministry,—but at this moment we shall confine ourselves merely to the announcement of them, and leave the public to form, from what we have said, some idea of the liberal and enlightened policy they have to expect from Lord Melbourne and his colleagues. It will be necessary, however, we apprehend, that the sign manual should be obtained to the cancelling of Lord Heytesbury's commission, before it can be legally effected; and we have yet the hope left, that the eyes of the Sovereign will be opened to the policy of his new advisers by this act, and that his Majesty will not suffer the public service to be impeded, and the money of his East Indian subjects squandered, in providing another outfit either for some shelved politician, who cannot obtain a seat in parliament, or for some favoured nominee of Mr. O'Connell, whose continued support cannot otherwise be relied on.

#### THE DUKE OF WELLINGTON AND OUR FOREIGN POLICY.

*(From the Morning Chronicle.)*

We are enabled to announce that although the ostensible object of Lord Eliot's mission to the head quarters of the contending armies in the Peninsular is to prevail on both parties to exchange their prisoners, and to acknowledge the ordinary laws of war, yet his real purpose is to declare to Don Carlos that, even should the rebellion be successful, England and France never will acknowledge that Prince as Sovereign of Spain. The Allies feel themselves solemnly pledged to the young Queen, and to the Constitutional order of things in that country by the Quadruple Treaty; and as the mission is the result of an application made to the English and French Governments under that treaty, and has the entire sanction of the Cabinet of France, we have reason to hope that it may be attended with success.

Don Carlos has been further informed that he can entertain no hope of assistance from the members of the Holy Alliance; for even if they were disposed to aid his cause, they would have to conquer France before they could send a single soldier into Spain.

Under these circumstances, we are taught to believe that Don Carlos has expressed his willingness to withdraw from the contest. He is anxious to join the Princess of Beira, who is about to take up her residence in Italy; and measures are in progress for enabling him to *escape* from the hands of the Biscayans and Navarrese, who are resolved, if they can, to detain him amongst them. Should

Don Carlos succeed in making his way out of the Peninsular, as we trust he will do, we may still, however, apprehend that Zumalacarréguy is determined on continuing the contest as long as he can command even a single party of Guerillas.

We must add, that the Spanish question is not the only one upon which the Duke of Wellington, while he was Foreign Secretary, followed up, in a perfectly honest and faithful sense, the foreign policy of his predecessors in office. With respect to the Dutch question, he expressed himself determined to abide by the views of the Whig Government, although it is notorious that he had looked upon the King of Holland as an "injured man." So also with respect to Portugal, he declared that he considered that kingdom as quite settled, and that he would not suffer it to be disturbed by Don Miguel. As to the only other important subject connected with our foreign policy, that of the new relations founded by the secret treaty between Russia and Turkey, the Duke followed it up precisely as Lord Palmerston would have done, in every dispatch which he had occasion to write to Lord Ponsonby. We have thought it fairly due to the Duke of Wellington to give publicity to this statement, which can only tend to confirm the high reputation which he already enjoys for his strict adherence to the letter, and even the spirit of the obligations contracted by this country with Foreign Powers.

At the same time the public will plainly see, in this adhesion of the Duke and his colleagues to the policy of Lord Palmerston, which, before their accession to power, they uniformly denounced as ruinous to the interest of the country, an irrefragable testimony in favour of the grounds upon which, in every instance, that policy proceeded. Had it been calculated, as the Duke and Lord Aberdeen had frequently declared in the House of Lords, to involve the country in war, to bring disgrace upon the very name of England, and to destroy her best commercial resources, they would hardly have ventured, we presume, to enforce Lord Palmerston's views and instructions previously conveyed to our Ministers at all the Courts of Europe.

#### MONEY-RENTS.

*(From the Brighton Herald.)*

It is accurately observed, by Mr. Jones,\* in his "Essay on the Distribution of Wealth," opposed as it is to the Scotch system of rents, that over the greater part of the globe *money-rents* are unknown. "Tenants, yielding plentiful rents in produce, may be quite unable, from the unfrequency of exchanges, to pay even small sums of money; and the owners of land may, and do, form an affluent body, consuming and distributing a large portion of the annual produce of a country, *while it is extremely difficult for them to lay hands upon very insignificant sums in cash.*" "Money rents," he then adds, "are, indeed, rarely required in any country from the *peasant cultivators*, and we may expect to find that the power of discharging them founded on *very peculiar* circumstances. Ireland is, perhaps, the only country in the world where this power exists in the peasantry to any extent. In the case of Ireland, it is the *neighbourhood of England*,

\* Mr. Jones, brother-in-law to Mr. T. Attree, of Brighton; a work that does infinite honour to the author.

and the connexion between the two countries, which supports the system of money-rents by the peasantry. From all parts of Ireland, the access, direct and indirect, to the English market, gives the Irish cultivators means of obtaining cash for a portion of their produce. In some districts, rents are paid in money earned by harvest-work in England.

\* \* \* \* And were this source to fail, the power of paying rents would cease in those districts. Were Ireland placed in a remoter part of the world, surrounded by nations not more advanced than herself—and were her cultivators dependent for their means of getting cash on her internal opportunities of exchange, it seems probable that the landlords would soon be driven, by necessity, to adopt a system of either *labour* (as in Russia) or *produce* (Metayer) rents.

This is really the key to the extraordinary state of Ireland. In all parts of the world—not only throughout Europe, but in most of the new settling lands in America, particularly in Upper Canada—some mode of paying rents *not* in money is established; and arises not out of legislative enactments, but from the nature and adaptation of things. The *rent* in Russia and Holland is a given quantity of labour: the peasant is bound to labour certain days for the lord, the owner of the soil. In Hungary the lord takes a certain portion of the produce. In parts of France, Italy, Germany, and even in Canada, the metayer system obtains; the landlord finds seed, implements, &c.; the tenant the labour; and the landlord takes a certain portion of the produce as rent, as an equivalent for the use of his land. Money-rents are never thought of; and if they were, money is so scarce that it would be impossible for the tenant to comply with such a demand.

In Ireland, on the contrary, though land is let in very small portions, and for very short periods, *money-rent* is always expected and always enforced. The reason is that the cultivators of Ireland have always a market (England), in which they can exchange their produce for cash. This is an immense advantage to the owners of land in that country. Instead of being compelled to take sometimes large and sometimes small quantities of wheat, barley, oats, vegetables, &c., (the difficulty and loss of turning which into cash there falls upon the landlord) in Ireland the landlord demands and obtains *money-rent*.

The evils of this to the tenant are various. As the population (which, under such circumstances, has scarcely any check) increases, the demand for allotments of land (almost the only means of existence) increases also, and thus rents become, through competition, enormously high; and every increase of population brings increasing advantage (at first) to the landlord, as the extreme demand for allotments compels the occupier to pay any demand as money-rent, rather than be without land and a home or a means of existence. Another evil that necessarily arises out of the abuse is, that the peasantry have no kind of protection: nothing to determine the amount of their rent: it is a matter of entire competition; the highest bidder obtains the land.

Another evil is there being no common interest between the tenant and the landlord, which, under either the systems of labour rents or produce rents, there is, because it is the interest of the landlord to show some forbearance and to give occasional assistance, or he himself must suffer; but the moment an Irish tenant becomes unable to pay, he is bundled out, and left to perish in the wide world, whilst another eagerly and instantly supplies his

place in his former allotment. Thus masses of people in Ireland are utterly destitute; and other masses are never more than a day's removal from such a state of utter destitution. Nor do the evils of Ireland end here: it is no uncommon thing for whole districts of miserable tenants to be ejected from their holdings. The landlords have taken into their heads to farm on a large scale, in imitation of Scotland and parts of England, and send forth an edict to "clear their estates."

We shall now glance at some of the effects of all this upon England, and, however abstractedly we may appear to be writing, we shall presently make it palpable that every word has a practicable bearing upon every man more or less in England.

One of the effects, then, of the system that has been pursued in Ireland, is to cause an immense emigration of the Irish into this country, and the effect of so many new hands being thrown into our towns, and agricultural districts, has been to beat down wages, and to add to that mass of pauperism that was already bearing down every thing before it.

Another effect is to introduce into England immense quantities of corn, butter, beef, pork, and every kind of provision. If the people of Ireland were well off, or so circumstanced as to be able to consume, like most other nations, the produce they raise, these provisions would be consumed at home instead of being sent to England. Instead of this, the Irish are half-starved; they live upon offal and the coarsest possible kind of food; and send off every thing they can spare to England for *sale*, and to obtain *money* to pay their *money-rents*; so that the very cause of poverty in Ireland—enormous *money-rents*,—produces similar results in England.

The prices of our corn are beat down—(as are wages by the emigration men)—by the introduction of Irish grain of all kinds. A similar effect is produced upon our butter markets, but more especially upon the price of all kinds of animal food. It is a fact that hogs cannot be reared and fed in Sussex at so low a price as excellent Irish bacon and pork—after every expense of shipment, wharfage, carriage, &c., is paid,—is sold for. Then, again, the necessity that compels the Irish peasant to part with his last pig, and almost his last potato, acts upon England by lowering the price of the agricultural produce of this country.

## THE CONSERVATIVES.

(From the Chronicle.)

There are said to be honest, though timid men, who have joined the Conservative party, because they have been told that the measures proposed by Reformers tend to shake the foundations of property, to destroy the gradations of rank, and even to endanger the Monarchy itself, who nevertheless profess their earnest desire to correct the numberless abuses that disfigure every department of the State. We beseech these men to consider, if they be sincere in their professions, that by attaching themselves to a party which has no other bond of union than the maintenance of abuses, they are contributing to uphold that very system which they wish to destroy. There may be Conservatives who are not enemies of reform, but of this we are sure, that there is no enemy of reform who does not call himself a Conservative. Is there a pluralist in the Church who performs his duty by deputy, and enjoys at a distance from his cure the income which ought to be expended

## ABLE-BODIED PAUPERS.

within his parish, that is not a Conservative? Is there a clergyman who aspires to one of those devoted stalls doomed by Sir Robert Peel himself to destruction, that is not a Conservative? Is there a younger brother who looks forward to a rich bishopric in return for his father's services to the Minister that is not a Conservative? Is there a sinecurist, or a place-man who employs another to discharge the duties of his office, that is not a Conservative? Is there a barrister or attorney who looks with dismay to reforms that may shorten the duration or curtail the expense of legal proceedings, who is not a Conservative? Is there a mayor or Lord Mayor who abuses and brings into contempt the brief authority of his office, that is not a Conservative? Is there a close corporation which wastes the funds of the community entrusted to its care, that is not a Conservative? Is there a noble family that seeks places for sons, and pensions for daughters, which is not a Conservative? Is there a landed proprietor who maintains the Corn Laws, because he cannot afford to lower his rents on account of his mortgages, that is not a Conservative? Is there a veteran contractor who regrets the glorious times of our just and necessary wars, and sighs at the recollection of the profits he then acquired, that is not a Conservative? Is there a monopolist who has suffered from the freedom of trade opening to others the sources of wealth which were formerly shut against all but himself and his partners, that is not a Conservative? Is there a money-lender who has risen to greatness by supplying the powers that were with the means of controlling and trampling on the liberties of mankind, that is not a Conservative? Is there a speculator who laments the quiescent state of the Funds, which renders it impossible to realize a fortune by one lucky hit, that is not a Conservative? Is there a political adventurer checked in his career by the reform of abuses, that is not a Conservative? Is there a renegade from popular principles, who despairs of reconciliation with his old associates, that is not a Conservative? Is there an upstart, suddenly and without any merit of his own, raised above the station in which he was educated, that does not think it genteel to become a Conservative? Is there a broken-down dandy desirous to efface at Court the remembrance of his youthful follies, that does not enlist among the Conservatives?

But if this be the composition of the Conservative army, what correction of abuses can an honest Reformer expect from such associates? Whatever weight his name, his influence, or his purse can lend to his party, will be employed to defeat the objects he has at heart. It will be in vain for him, after the victory is gained, to protest against the abuse that will be made of it. Let the Conservatives but once obtain a majority in the House of Commons, and the Reform Bill will soon be an old almanac. To acquire that majority is the object of all their efforts and intrigues. To determine elections in their favour, they are multiplying and extending their clubs in every direction. These clubs, like the Jacobin clubs of France, fraternize with each other, and corresponding with the parent society in Carlton-terrace, they receive from its leaders instructions and directions how to act. The avowed purpose they pursue is to obtain a majority in the House of Commons—which their leader has described to them as the chief authority of the State—not to repeal the Reform Bill—for that he disclaims—but to modify and amend it—to fitter it away and reduce its efficacy, so that Tories may rise again to the pinnacle of power from which they have been precipitated.

"The practice (says the writer in the *Law Magazine*) usually introduces itself into a parish in the following way. The less substantial occupier, finding the Saturday night payments to his labourers inconvenient at a season when he can best spare their labour, discharges a portion of them *in the full confidence that they will not readily, at that time, find a new service, and that they will not go far a-field in search of it*, inasmuch as the law, in the supremacy of its wisdom, has said to the parish, 'when one of your men is out of work, you shall find him work.' When a man cannot find work for himself, it is not very easy to find it for him, but wages sufficient for his support he must have—out of the poor-rates. The other occupiers of land in the parish feeling, as rate-payers, the injustice of this operation of law, gradually fall into the same practice, as the only mode of being even with those who had preceded them; and when the thing has become general, all the benefit and all the convenience of the shift are lost to each party availing himself of it; for while his own labourers are supported by the general fund, he contributes to making that fund support the labourers of others. In the mean time so much labour (valuable, more or less, at all seasons) has been lost to the land. Nevertheless this ruinous system is perpetuated from year to year by the agency of the pecuniary sufferers themselves: partly through the utter helplessness of the parish as a body managing its own affairs, and partly from the pressure of the prevailing stream of interested motives, of which the most operative is the desire of obtaining labour as cheap as possible, although innumerable petty under-currents are strongly urging in the same direction. In few words, to use an agricultural image, the parish is a straw-yard into which the farmers turn their labourers, precisely as they serve their cattle in the winter months, to subsist on low diet until the season opens when they may take them out again for work.

"The employer of labour, then, has been and continues the prominent and chief actor in this anti-social train of proceedings; the labourer, at first a passive victim of the legislature and the interested views of those who employ him, is at length forced into mischievous energy by the corruption of his personal habits and motives, and ultimately takes the lead in that vicious and unnatural system of looking to the poor-rates for wages, which, ruinous as it is to all parties, is most directly so to him. The latter position will be most clearly made out by enumerating some of the chief circumstances which distinguish a parish thus pauperised from the well-conditioned parish above described; always bearing in mind that the statistics of the two parishes were perfectly parallel with each other, so far as the actual resources for employment are concerned.

"In the first place, the wages of labour, not employed in taskwork, have fallen as low as 7s a-week. Many modifications of causes, all springing from the great root of the evil, parish employment, contribute to produce this miserable effect on the income of the independent labourer. One great ingredient in the contract for wages is the necessity of the labourer to be supported, a necessity which operates on the employer of labour almost as stringently as on the labourer himself; if this necessity is met and satisfied by another and than that of wages, a fall in the ordinary rate must inevitably ensue. Again, the regular farm-servants

being dismissed from their service at certain periods, and being detained on the spot by parish employment, it arises that one man will do for several private services, which in a natural state of things would each require a separate individual,—hence again wages fall. Again, all labour of a public nature, such as the repair of parish roads, is withdrawn from the independent labourer, to meet the demand for pauper employment. A vast amount of private employment is forestalled and appropriated in a similar manner. Ponds are cleared out, woods are stubbed, lands are drained, before the exact time has arrived at which the interest of the proprietor would suggest those operations; in consideration of which circumstance the job is contracted for by the parish at a low rate for the employment of what are called its surplus men. That surplus, which is at first a cheat, a delusion, a mere game of thimble-rig played between the employer of labour and his victim the rate-payer, finally becomes a reality in some cases; hence again that lowering of wages which naturally results from an over-competition for the work.

“But the grand and leading cause of this reduction of wages is the ACTUAL DIMINUTION OF THE INTRINSIC SPECIFIC VALUE OF THE LABOUR, arising from the injurious effects of parish employments on the industry and motives of the men. To the great majority of labourers in any parish, namely, the family-men, it is a matter of indifference, in point of income, whether they receive their wages from the public or the private fund; the only circumstance which is left to bind them to a preference of private employment being *the abstract love of work*. In the case of many of the older labourers, confirmed in habits of industry, this single motive has been found all-sufficient to preserve their energies from corruption; and a bitter sight it is to see men of this stamp, in the possession of full bodily vigour, driven, without a pretext of complaint, from services of long-standing with masters to whom they had become attached; the ground alleged being invariably of this nature—“So-and-so has turned off two of his men: I can't afford to pay their wages and your's too; you must go.”

“On the other hand, the younger class of labourers in the pauperised parish are showing symptoms of rapid degeneracy, equally injurious to themselves and to the capitalist, who, but for the operation of this system, would be finding them in constant employment at fair wages adequate for their support and remunerative to himself. And this, perhaps, is the worst point of the comparison which the pauperised parish presents with the well-conditioned parralel. *A great portion of its rising generation of labourers are growing up wholly unskilled in the different branches of agricultural work*. They cannot hedge, ditch, drain, thatch, thrash, plough, sow, or do any other farm-work in a manner worthy of their hire; and many are wholly unused to any sort of work, but such as requires neither skill nor practice; in fact, the mere removal of earth. This, and this only, they have learnt upon the roads, together with such habits as make them unfit to be trusted about a homestead. The result is, that while the farmer is paying wages for road-work which is not wanted, and therefore not superintended, and therefore not done, he is obliged to go far and near for labourers fit for the better sort of farm-work. *He is thus suffering from surplus labour, and a dearth of hands, at one and the same time.*”

## THE CHURCH.

(From the Times.)

“We refer with deep interest to the report of last night's proceedings in the House of Commons, when Lord Stanley presented a petition from the parishioners of Kirkham, of which the vicar and the *should-be* minister is Dr. Webber, formerly chaplain of the House of Commons, but who at present, besides being non-resident and somewhat exacting, vicar of Kirkham, is also Dean of Ripon, and a prebendary of Westminster. It were needless for us to recapitulate here what is plainly described in the Parliamentary proceedings—a case which combines almost every property of abuse and grievance in the condition of the Church of England—plurality, non-residence, *disregard, as it would seem, of stipulated engagements, and total insufficiency in the discharge of that most precious of all, or rather that sum of all the duties of a Clergyman—the cure of the souls committed to his pastoral guidance*. This is matter for real Church Reform. These are the blots which do disfigure our Church. This is the dry rot which undermines and ruins it.”

## REGISTRATION OF VOTERS.

(From the Morning Post.)

It is highly gratifying to observe that the advice, based upon experience, which but a few months back, we tendered so anxiously to, and enforced so earnestly upon, the Conservative party, namely, to form societies for the purpose of watching the registry, and securing the enrolment of *bonâ fide* electors, has been at length followed with energy and spirit. What, indeed, availed it that the wealth, intelligence, and respectability of a county or borough were arrayed on the side of order and good government? When the struggle really ensued—when the decision was to be made by a majority of registered votes—how worse than ridiculous was the situation of the well-meaning, but idle and careless individuals, whose virtual disfranchisement had been effected through their own neglect.

With the midland counties these admirable associations, for the purpose of purifying the register, originated. The electors of Newark and Leicester, unwilling to be misrepresented, determined to associate for this most constitutional as well as legal purpose, and the elections which took place at the commencement of the year afforded an example of what might have been almost universally effected, had the friends of the constitution in all other been equally zealous and watchful.

Our humble but sincere exhortations have now been reinforced by a most powerful and influential instructor in the person of Sir Robert Peel, who insisted with great force on this interesting topic in his unrivalled speech, on a late important occasion; and the daily announcements which we have the gratification of making yield a satisfactory reply to the appeal of the right hon. baronet.

“Oh, but,” say our opponents, “we will form counter-associations; nay, if need be, we will revive our Political Unions for the purpose of offering that assistance to the honest voter which consists of ‘death’s-heads and well-seasoned bludgeons.’” Be it so, we fear them not. Let but the real substantial elector remain upon the registry, strike off all who have no right to vote, enforce the provisions of the Reform Act strictly, without

favour or affection, and we have no fear whatever for the result.

That such a course will be adopted we have now no doubt. Meanwhile, and until an opportunity for fairly polling the constituent body shall be afforded, let the Conservatives of Great Britain continue to meet, and to unite in a common determination to act with energy and zeal in support of the good cause. Let the rich and the poor, the exalted and the humble, understand that their interests are one, and inseparable—then he plots of wicked and foolish men will be discovered and crushed, and the interests of this mighty empire be again placed upon a secure and immovable foundation.

The state of the registration, the county registration particularly, in various parts of the kingdom sufficiently attests the necessity of associations, to stimulate some individuals to the effort, small as it is, which the Reform Bill requires, as a preliminary to the exercise of their elective rights; and to regulate or counteract the excessive zeal with which others employ themselves in the creation of faggot voters.

### THE TENANT VOTERS.

(From the Courier.)

The first day's polling in Devonshire has not answered our expectations. We presume that we have counted too much on the independence of the farmers. A few days ago we stated that the farmers were living, as it were, on alms. We had observed on several occasions, announcements of landlords having made abatements in their rent, and of the tithe owners having deducted something from their legal claims on the farmers. Even with these deductions, the farmers can scarcely go on; without them, they must have been totally ruined. But neither the landlords nor the tithe owners are under any legal obligations to make these abatements. Of course the farmer cannot demand them, or cannot enforce their demands. They are acts of favour, which, not being granted, the farmers would be undone. Thus, in their present situation, with wheat at forty shillings a quarter, they are completely at the mercy of their landlords and the tithe owners. They must vote as they are bid on pain of destruction. One of the provisions of the Reform Act is, that a man is disqualified to vote who has received parish support; but surely a man who receives parish support is far less dependent than one who must be ruined, unless an individual gives up his legal demands on him. At present, the farmers are generally in this state of pauperism; they are worse than being dependent on the parish, for they are dependent on individuals; and though we do not say that they ought to be disfranchised, we say that many of their votes must only be looked on as the votes of the Dean and Chapter of Exeter, of the Rectors of the various parishes, and of a score or two of landlords. The votes of those farmers whose landlords must abate their rent, and whose tithe owners must abate their tithes, are no more an indication of public opinion than would be the votes of so many paupers led to the hustings by the master of the parish workhouse.

### IMPORTANT DECISION OF THE OXFORD CONVOCATION, WITH THE OPINION OF "THE TIMES" THEREON.

On Wednesday se'night the Convocation assembled in order to take the sense of the University at large, upon a proposal for establishing a certain form of "declaration," in lieu of the present long-established practice of subscription to the thirty-nine articles, on the part of under graduates at the time of matriculation.

It was proposed to substitute at matriculation a subscription to the following declaration, instead of the usual subscription to the 39 articles as heretofore:—

"I, A. B., declare that I do, so far as my knowledge extends, assent to the doctrines of the united church of England and Ireland, as set forth in her 39 articles; that I will conform to her Liturgy and discipline; and that I am ready and willing to be instructed in her articles of religion, as required by the statutes of this University."

Upon a division taking place, the Senior Proctor declared the majority to be adverse to the change. The numbers are reported to have been as follow:—

|            |   |   |   |     |
|------------|---|---|---|-----|
| Placet     | : | : | : | 57  |
| Non-placet | : | : | : | 459 |

In our paper of last Saturday we anticipated a question of great importance, although, as it appeared to us, of extreme simplicity, which was about to come in the course of the present week, before the Convocation of Oxford. Unhappily, we had likewise a just foreboding of the manner in which that question would for the present be disposed of. As it is the furthest thing imaginable from our wish to offer fruitless offence or cause for irritation to the venerable body who deemed it unbefitting their wisdom or their dignity to hear with favour our respectful counsels, we shall now abstain from entering a second time upon the subject.

It remains for us merely to inform our readers, that the proposal to modify the declaration subscribed by youths on matriculating in that University, so as to render it more safe for the consciences of those who have hitherto signed it in the dark, and more consonant to the moral sense and dispassionate judgment of those who look at Oxford from a distance, with no disposition to find fault undoubtedly, but at the same time in no spirit of weak indulgence—it remains for us to say, that the proposal was peremptorily rejected! and by a majority of more than eight to one, or 469 to 57.

This is to us a lamentable issue to an attempt conceived and undertaken with the most upright and provident solicitude for the welfare of the University. It is a proceeding which even Sir ROBERT INGLIS cannot in his heart approve. The resident powers of the University will, we fear, be soon driven to a perception not merely of the embarrassments which they thus entail upon those friends by whom they are in the habit of expecting to see the Church of England and Oxford itself, one great nurse of learning and religion, defended, but of those imminent dangers which a course of mildness and moderation in the heads of our Universities, as well as of liberal and discreet attention to the aspect of the national mind beyond their precincts, might some time ago, perchance, have averted. It is a topic to which we advert not without serious pain.

## HOOTON HALL, CHESHIRE,

(PLATE.)

THE SEAT OF SIR T. S. M. STANLEY, BART.

Hooton Hall, the seat of the worthy baronet whose name appears at the head of this article, and of which a very correct view is given in the engraving, is situated on the peninsula, or rather perhaps tongue of land, which stretches, between the Dee and the Mersey, from Chester to the Irish sea. The elegant mansion stands on the north-western side of the park, which is beautiful and extensive; stretching for a very considerable distance along the banks of the Mersey, the sandy shore of which is hidden from the view of the house by lofty groves; where myriads of the sable feathered tribe, known by the name of rooks, have for ages taken up their nestling abode. The boundary of the park is, for the most part, fringed with wood, in a very interesting and picturesque manner, in which the monarch of the forest predominates, whose russet aspect is, during the winter season, contrasted with the sombre appearance of a variety of the stately pines and other kinds of evergreens.

On the north-eastern side of the mansion the gardens are laid out, while in the opposite direction, at a convenient distance, are situated the stables for the hunters, carriage horses, &c., and to the left of these, at the distance of a quarter of a mile, stand the racing stables with their requisite offices. Considerably to the right are the kennels, sufficiently spacious for the accommodation of both fox-hounds and harriers, a pack of each being kept by Sir T. Stanley.

With two packs of hounds, a kennel of pointers, a complete stud both for the field and the turf, Sir T. Stanley presents an instance of a genuine English gentleman (or, rather, a country prince), enjoying a splendid fortune in the best manner possible, his residence not more remarkable for the beauty of its situation, than for its generous hospitality.

Of the baronet's harriers I have but little to say, though I have had an opportunity of examining them in the kennel, and also of observing their performances in the field: they are light, fleet, pretty little dogs, that, with a good scent, will soon bustle a hare out of her life; a fox-hunter, however, will seldom be found to enter with enthusiasm into the mazes of this department of the chase, of which Sir T. Stanley offers a striking example; he keeps harriers, but rarely, if ever, goes out with them; he is as regular as possible in his attendance on the fox-hounds, and leaves thistle-whipping to others.

His fox-hounds have experienced very great improvement, particularly during the last seven or eight years, and his pack at present contains a number of individual specimens, which would bear an advantageous comparison with any hounds in the kingdom, not excepting the deep-chested beauties of

Mr. Meynell, the deeper-flewed Cottesmore, the Pilot family of Mr. Osbaldeston, the elegant Villagers of Sir H. Mainwaring, or even the Jokers of Mr. Wicksted, whose Carnage, Crafty, Crazy, and Cruel, four sisters of the same litter, out of Countess, by Joker, may be considered as paragons of their kind. Chanticleer and his family were favourite hounds in Sir T. Stanley's pack. The sire, who ceased to go out in 1832, has frequently attracted my attention in the field, by the admirable and masterly style in which I have observed him unravel a knotty point, and hit off the fox: he was an excellent live hunting hound, he would bring along the scent, and he was fleet also. Regent, now five years old (if my memory be correct), is a beautiful specimen of the fox-hound: he is a line hunter, but frequently runs at the head of the pack. It was highly interesting to notice the emulation of this dog, and a light-coloured bitch of the same age, called Brilliant. This bitch\* was the leader of the pack: she would pass Regent, but the moment the scent became doubtful, she leaned to this true-running dog, and depended on him to unravel the labyrinth. Brilliant is a bitch of uncommon speed and extraordinary power, as was clearly indicated by

“her rush-grown tail  
“O'er her broad back bends in an ample arch;  
“On shoulders clean, upright and firm she stands;  
“Her round cat foot, straight hams, and wide-spread thighs,  
“And her low-dropping chest, confess her speed,  
“Her strength, her wind, or on the steepy hill,  
“Or far-extended plain; in every part  
“So well proportion'd.”

Some hills, covered with short heather, on the banks of the Dee, to which foxes, found in the neighbourhood of the village of Upton, would frequently point: at the distance of a quarter of a mile or more, I have frequently noticed Brilliant, conspicuous from the contrast of her light colour to the dark and dingy appearance of the heath, straining away fifteen or twenty yards in advance, without a horseman nearer than myself, the hounds, without the huntsman, running as true as possible. The scent is always good amongst heather, and the consequence was, that on such occasions, Brilliant always became a distinguished leader. I once saw

\* In fox-hounds, bitches are fleetier than dogs; the fleetest pack I ever met with were Mr. Osbaldeston's *Flying Ladies*, which I once saw run completely up to a fox, on the wings of the wind, in a few minutes less than half an hour. The fox was beaten; he began to thread the hedge, the more elderly ladies of the pack, who had hitherto “taken it easy,” sprang to head like bristly boars; the pack caught view as he was going, with tongue black and pendant, by the side of the hedge, in advance forty yards or thereabouts; when a year-old bitch shot out clear ahead of the whole, reached, but durst not seize, him: she, however, tumbled him over, and *whoop-whoop!* followed in a few seconds.

her contrive to get over a wall nine feet high. The hounds run a fox up to Hooton Park, and renard contrived to scramble over the wall in question; but on the pack reaching the place, it proved a bar to their progress, with the exception of the bitch in question: she got over, after several unsuccessful efforts, but none of the rest could surmount the obstacle.

Sampson and Rockwood are fine hounds, excellent finders; whenever they speak, their word may be taken—"a fox for a hundred," as the 'Squire (Osbaldeston) would say.

If, however, the hounds of Sir T. Stanley are what they should be, the same remark cannot be extended to his country, which is the worst I ever crossed, not excepting Naseby Field, or the deepest part of the Vale of Belvoir. That part of Sir Thomas's country nearest to the good old city of Chester, is evidently the best part of it; and yet good runs seldom occur here. There is one consolation however, in meeting these hounds—a blank day never occurs—the country is better stocked with foxes than any other in England; and that, too, in defiance of the exertions of two or three whining vulpicides, who, a few years back, resorted to the most disgraceful expedients for the destruction of foxes.

To a casual observer, riding on the main road from Birkenhead to Chester, the country would appear neither difficult nor heavy; and a similar remark may be extended to the superficial view along the Parkgate-road; but it assumes a very different character on near inspection: many of the fences, which at a distance seem to be such as a horse would take in his stride, when approached, will be found, for the most part, to consist of a rotten hedge, placed on a still more rotten bank, with a yawning ditch—to use the impressive words of my worthy friend, Major Jones—"as wide as a canal!" There are many very deep, very heavy, and very awkward lanes, which intersect the country in all directions; some of which are narrow and sunken, so that they are only discernable at a very near approach; the descent into them is very uncouth, the opposite ascent equally so; while they are altogether impracticable as a flying jump. The neighbourhood of Stanley Gorse (a sure find) is any thing but inviting; and a similar remark is equally applicable to a number of other covers; but, of all places within the circle of fox-hunting, they sink into nothingness compared to Pooton Wood! I have seen some miry deep woods in the Earl of Lonsdale's country, as well as in other parts of Leicestershire, Staffordshire, Cheshire, Yorkshire, &c., &c., but nothing like Pooton Wood, the roads to it (if roads they can be called), and its immediate vicinity. It is formed by almost impenetrable brushwood, stunted oaks, and other trees, which very thickly fringe the very abrupt sides of opposite hills for about a mile or perhaps more, the sinuosities of which, far from being allied to the picturesque, are cramp, sudden, and ill defined. A brook runs the whole length of the cover, in the valley between the abrupt hills just mentioned, which, as its course is necessarily directed by the semi-serpentine form of its banks (already noticed), its winding becomes equally crooked, even to zig-zag. It is not remarkable for width; but almost impracticable from the difficulty of approach, from the very soft and miry nature of the ground. I never saw any person who could get over this brook cleverly (though I have frequently witnessed its conversion into a cold bath), but Joe, Sir T. Stanley's late whipper-in; and a better first whip never attended a pack of hounds—active, quiet, good-tempered, an excellent horseman;—unsteady conduct, frequent intoxi-

cation, drove him from a good master and a comfortable home, to the office of cab-driver in Liverpool.

Pooton Wood contains several extensive earths; and as the owner, Mr. Green, is very friendly to fox-hunting, though no sportsman himself, and resides close to the cover in question, it always holds plenty of foxes. It is the strong-hold of these animals, from which they will not be driven, and to which they generally fly if found at any reasonable distance. They hang to this place in defiance of the exertions of hounds, huntsman, and whips; it is true I have seen them forced from it a hundred times—only to enter it again in the course of a few minutes or seconds, for which its sinuous or zig-zag form renders it peculiarly convenient. Once only have I known a fox to leave it fairly; and he was found in Sea Rough, a fine gorse cover, close to Hooton Park. On going away he pointed directly for Pooton Wood, taking Eastham Wood in his way; on approaching the former I slackened my pace, never for a moment supposing he would leave this impregnable fortress, and Mr. W. Stanley, eldest son of the baronet, entertaining the same opinion, we proceeded very leisurely down a very deep tenacious lane towards the place in question, intending to station ourselves on the bridge leading to the residence of Mr. Green, while the hounds rattled him in the wood. On reaching this spot, however, to our surprise we found there was no rule without an exception, and that our fox (contrary to custom), disdaining the protection of the strong cover in question, had passed directly through the wood, and gone gallantly away for Stourton. The hounds had got considerably ahead: but, by dint of hard riding, we reached them, being very much favoured by an indifferent scent. Renard continued his course, leaving Stourton covers on the left, and making for Upton. He passed the village of Upton on the right, and at length climbed the summit of Bidston-hill, passed round the Lighthouse, and, turning to the right, got to earth in Price's Wood, after a lingering business of three hours and some minutes. The pace was good till the fox reached Pooton Wood, when it sunk so much that the hounds could never get on good terms with him afterwards; he was therefore enabled to regulate his pace, to keep at what distance he thought proper from his pursuers, and ultimately to enter the seldom-failing protection of the earth as comfortably as possible.

Sir Thomas's country abounds with drains, which frequently afford an asylum for a hard pressed fox. When discovered in a drain, or similar situation, they are not suffered to remain unmolested, since it would not be using the hounds well, in so difficult a country for them, and where, too, foxes are very numerous: they are, therefore, bolted; and I have seen the very worthy baronet patiently watch the progress of digging to them for hours. A fox which had been frequently found at one of the Upton covers, uniformly made for Stourton, and was as uniformly lost a short distance before he reached that place, at the village of Thornton. The hounds threw up in the middle of a field adjoining the village, and it was generally supposed that the fox headed back, and baffled his enemies in some unknown retreat in or about the buildings of the village. However, unfortunately for renard, he was compelled to stand up before his staunch pursuers when the aspects were against him—his evil star had become lord of the ascendant; for honest farmer Johnson happened to view him into the field before mentioned; and what was more, he happened to observe him disappear at the spot which he knew to be the outlet of a small drain. In consequence, when the thunders of the chase reached the village, this hitherto secure

retreat, was made known, he was bolted; and, being compelled to quit the asylum where he had hitherto experienced protection, his courage failed him, he soon sunk, surrendered his life, and died without complaint.

Although there are few very extensive covers in the country hunted by Sir T. Stanley (a great part of which is his own property), small roughs almost everlastingly present themselves; and, in consequence, of all countries I ever crossed, I never met with one half so difficult for hounds; foxes hang to these sheltering places with obstinate perseverance; and, therefore, a circumstance very unusual with fox-hounds is of frequent occurrence, namely *casting back* the moment the hounds came to a check, instead of casting forward. Ned Davies, the huntsman, the favourite and confidential servant of his excellent master, in whose service he has grown gray, is well aware of the necessity of this unusual manœuvre, and thus, by his superior knowledge of casting the hounds, contrives to kill many more foxes than his predecessor in office, Tom Jones. I have frequently noticed Davies's sagacity, but never with more surprise than on the following occasion. A fox being found in a cover called Plymiard (in the month of January, 1830, if my memory serves me correctly), testified much reluctance to leave it; he showed himself repeatedly, and a noble old dog he was; his brush was furnished and finished with one of the finest tags I ever saw, with a flourish of which he several times headed back into cover; at length the welcome tidings rung in the breeze—*gone away! hark forward!* I was not well pleased for a start; but observing that thorough-good sportsman, Mr. Peel (cousin to Sir Robert), at some distance, I knew I could have no better pilot, and contrived to keep my eye upon him till I got up, or reached the main body. The country was uncommonly deep and heavy, and I had not crossed three fields before I observed a couple of nags, without riders, and W. Davis of Birkenhead, comfortably placed on his back in a soft miry ditch—no harm done. I could observe, stretching away in front, Mr. Humble on Jerry,\* accompanied by Mr. Cockerill on his accomplished bay mare (a more complete or better hunter was never ridden to hounds), Mr. Peel on his powerful grey, Mr. McDougal on the Baker, followed by Messrs. Senior, Poole, and three other gentlemen; then came those steady workmen, Messrs. Newton, John Aspinall, and Mr. Haigh; Mr. C. Stanley, the brother of the master of the hounds, was placed, but not as usual, in the front, owing, I believe, to indisposition; then followed, at a very respectful distance, the tailers, and of these the number was considerable; for the pace being brilliant, and the country very spewy, many were completely left behind in the first ten minutes: therefore, casting a retrospective glance, a long string of tailers might be distinctly observed, struggling along, however, and calculating on a check to let them in.

For three-quarters of an hour we went best pace, without a check, when, owing to the intervention of a succession of covers, some time was lost; yet we reached the village of Burton, on the banks

of the Dee in an hour and fifteen minutes, the fox unquestionably dead beat. Renard, leaving the village a trifle to the right, endeavoured to shelter himself in Mr. Congreve's plantations, where I saw him surrounded by the hounds: yet he contrived to extricate himself; he scrambled over the wall; and, as if anxious for the benefit of clergy, he sought the protection of the churchyard, where he would have died, had not the village been in commotion, uniformly the case under similar circumstances, so interesting is hunting to the human feelings:—

“The hunter's shout,  
 “The clanging horns swell their sweet-winding notes,  
 “The pack wide opening load the trembling air  
 “With various melody: from tree to tree  
 “The propagated cry redoubling bounds,  
 “And winged zephyrs waft the floating joy  
 “Thro' all the regions near: afflictive birch  
 “No more the schoolboy dreads; his prison broke,  
 “Scampering he flies, nor heeds his master's call:  
 “The weary traveller forgets his road,  
 “The ploughman leaves th' unfinished furrow;  
 “Nor his bleating flocks are now the shepherd's joy!  
 “Men, boys, and girls,” &c. &c.

The motley crowd impeded the progress of the hounds; and, although I distinctly saw a bare-headed cobbler make an attempt to cover the fox with his leathern apron, yet Renard extricated himself, and made away, pointing for a favourite cover (the name of which I do not at this moment recollect), at no great distance; and, in consequence of the village confusion, the hounds flying wildly in all directions, several minutes elapsed before order could be restored, and the hounds got again upon the line of him. They picked a cold scent for a short time, and threw up. Davies, in opposition to the opinion of the field, cast them back to the right; and, after some time, recovered the scent. I was so fully persuaded that it was not the hunted fox, that I pulled up, aware, after the run which had taken place, neither hounds nor horses were a match for a fresh fox. Davies persevered, however, accompanied by a few of the more mercurial spirits, and after a slow, tedious thing, killed his fox about two miles from Chester, after a run of more than three hours, forty minutes of which was very pretty—I have seldom, indeed, seen it surpassed. Renard had, it seems, as a last resource, swam across a large pit, and crawling about a yard up its opposite bank, seated himself on a large stone, where he suffered the approach of his merciless pursuers without being able to move farther.

Yet, notwithstanding the quality of Sir Thomas's country, it is not destitute of charms; to say nothing of the hospitality of Hooton Hall, as well as of the satisfactory anticipation of always finding, it occasionally produces highly interesting runs.

On the 20th of December, 1829, I met these hounds at the favourite fixture of Upton (where Mr. Webster, like Mr. Green, at Pooton Wood, though no sportsman himself, is assiduously careful to preserve the foxes), where we very soon found; and the fox, after a very pretty little ring of ten minutes, brought us to the very spot where he had been found: it was a plantation, covering the space of two or three acres, and the hounds run him well up to it; but sly Renard having very cunningly laid himself down at its edge, the hounds overrun him and became mute. They threaded the cover in every form, fifteen minutes elapsed, and I, as well as the rest of the field, thought he had given us the slip, when the deep tones of Chanticleer announced the glad tidings of recovery. Renard broke away in the face of the whole field (a circumstance unusual), and he appeared to me as if he meant to run. At first he made

\* This horse was thorough-bred, rather leggy, but was very wiry and very fleet. In a steeple chase, he cleared the extraordinary distance of nine yards nine inches at a single jump. Jerry finished his career about eighteen months ago. The steeple chase just mentioned, took place, February 24, 1832, in Sir Thomas's country, from Little Sutton to Backford Cross, three miles, and was completed in twelve minutes and a half—Jerry was the winner.

for the higher grounds, pointing for the best part of the country ; but he altered his course in a few minutes, and, bending to the right, took to the Mains (if I am correct in the name), going for Bidston. However, he left Bidston to the right, crossing the Mains in the opposite direction for some distance ; and as the place just mentioned is neither more or less than a spewy swamp, it became distressing beyond measure to the horses. The pace was good, but not brilliant, nor could the pace be brilliant over such a country. In about twenty minutes we came to a wide brook, called the Fender ; and, although a convenient bridge presented itself, at the distance of fifty yards, (over which the greater part of the field passed), Messrs. Errington, Peel, Humble, Cockerill, the brothers Horridge, and four others, were determined to ride straight. The young Horridge was the first to charge it, and the little thorough-bred chestnut mare which he rode (belonging to Mr. R. Aspinall) cleared it very cleverly, to my surprise : the rest (eight in number) were not so fortunate—they converted the said Fender into a cold bath ! Joe Howard, the first whip, proved too cunning for himself : he endeavoured to ride through it—he rode in—his horse stuck—he was forced to dismount—and waded back up to his breast in water !

At length the business brought us to the village of Wallasey, in the thickly-covered gardens of which renard endeavoured to shelter himself. I viewed him repeatedly as he threaded the gooseberry-bushes ; and when he found the gardens no longer tenable, he came undauntedly into the village, made his way amongst the legs of the horses, and entered the opposite farm-yard. He appeared dead-beat, but such was not the case ; for, making his way by the back of the cottages, he appeared on the common, and reached a rabbit-warren situate on the sea shore, where he brought the hounds to a check. Some minutes elapsed before he was again hit off, when the hounds picked the scent in the direction for Poulton village : the scent improved, the hounds began to carry a head, when the writer met with a tumble which prevented his witnessing the finish. Some minutes elapsed before I caught my horse (which was stopped for me), and when I reached him, I was unable to mount, owing to the fracture of my left collar-bone, which ultimately became a painful barometer, which at this moment indicates bad weather. The fox was evidently an *old stager* ; he knew the country well ; and being hitherto unsuccessful in baffling his enemies, he was determined to make his last point good ; he passed close to the village of Wallasey, swam the upper part of that extensive sheet of water called Wallasey Pool, and at length reached Price's Wood, where the hounds were stopped, the earth being open, and fresh foxes likely to go away before beaten hounds and beaten horses.

Stanney Wood, though not a general favourite, was particularly so with me. Gorse covers are preferred to woodlands, because the fox can seldom leave them without being viewed away ; nevertheless, I like to witness the find in a wood, particularly on account of the music ; and the greatest gratification of this sort I ever experienced was in Skelton Springs, near York, some few years ago, where the York and Ainsty hounds found a fox. Stanney Wood generally holds a fox, and I have several times experienced pretty runs from it.

Hooton must be a favourite fixture for those who wish to witness the sport without incurring much fatigue ; and there is something very interesting and very pretty in the scene which is presented on such occasions. The hounds are brought in front of the mansion, where they receive the caresses of the ele-

gant and highly accomplished Lady Stanley, and her female friends : it is amusing to observe the expressions of delight manifested by the canine assemblage, when receiving these attentions from the loveliest part of creation :

“ See here with countenance blithe,  
“ And with a courtly grin, the fawning hound  
“ Salutes thee cowering : his wide opening nose  
“ Upwards he turns, and his large sloe-black eyes  
“ Melt in soft blandishments and humble joy !”

After a few minutes spent in this way, the word is given : and as the covers which fringe the park are seldom without foxes, these are tried : the foxes very rarely go completely away from them ; on the contrary, they cross the park (several times perhaps) from one part to another, and thus afford the ladies an opportunity of witnessing the business in the most pleasant manner possible. On such occasions Lady Stanley and her friends do not remain in the house for the purpose of becoming stationary spectators, but, like kindred goddesses, issue from the mansion to preside over the sports of the day.\*

If, however, Hooton Park seldom afford a good run, though well stocked with foxes, the case is different with the covers in its vicinity, as the following will show.—On Tuesday, March, 16, 1833, I met Sir T. Stanley's hounds at the village of Whitby, two miles on the southern side of Hooton, and a short distance from Stanley Wood, into which the hounds were thrown, and spoke to their game almost immediately. The fox broke cover, run short, and returned—it was a vixen, heavy, and the hounds were stopped.

We drew towards Hooton, and nothing worth notice occurred till the hounds proceeded to draw a fine gorse in the township of Eastham. Perceiving the master of the hounds ride round and place himself at the eastern corner of the cover, and aware that the worthy baronet not only knows his country well, but possesses also a sort of prescience of the movements and workings of the foxes with which it is so well stocked, I followed, and took my station within a few yards of him. Not many seconds elapsed ere the sonorous note of Sampson reached my eager ear ; I knew it was good—I knew Sampson was no babbler—and his deep tones on this occasion formed the knell of as gallant a fox as ever stood up before hounds. In a few seconds I observed renard leave the lower end of the cover, look round, and make off—as if he meant to run. I must here observe, that when the baronet took his station, he contrived to have an impassable barrier in the form of a lofty unopenable gate, between himself and the rest of the field (myself excepted) in order to prevent that crowding and pressure upon the hounds when the fox goes away, which is so common and so highly injurious to diversion. The gentlemen, therefore, became very impatient when the fox broke, though not a single hound had left the cover ; but they did not lose much time in debate, at least, the highflyers amongst them : Captain Dunn,† Messrs. Cockeril, Leigh, Humble, Peel, Owens, Johnson, Cook, John Davis, Congreve, Scholes, G. Aspinall, Hetherington, Solomon, &c.,

\* The ladies generally appear in a double phaeton, drawn by two beautiful stout grey ponies.

† I have often felt a high degree of interest in observing the anxiety testified by this accomplished gentleman and gallant soldier to ride straight. He infuses his military ardour into the spirit of the chase, and faces the fences after a fox with the same invincible courage, as he would encounter the enemies of his country.

turned to the right, and after describing an ill-defined semicircle of two thirds of the cover, got well placed as the hounds settled to the scent.

When the fox broke cover, there was something in his manner and appearance at variance with the usual characteristics. He was large and ragged, very dark coloured and destitute of a brush: he left the gorse hurriedly, and went away as wildly as possible, pointing north-westerly, the dark lowering hills of Flintshire bounding the view. Forward and fearlessly rode the gallant Captains Dunn and Stanley (son of Sir Thomas,) accompanied by Messrs. Humble and the élite. The master of the hounds went uncommonly well on his Maximilian mare, while the elder Congreve manifested much more than his wonted vivacity. Mr. Bateman, from Frankfort on the Maine, seemed very much to relish this genuine English sport. The hounds carried a good head; and I begin to make up my mind for a visit to the Principality; when renard, disliking, I suppose, the expanse of the river (the Dee in this neighbourhood is several miles wide,) leaned to the left in the direction of Willaston; but he left this place on the right, and I concluded he was making for Stanney wood; the hounds had gone well away with him, and hitherto without a check, had continued on very good terms; therefore, finding himself hard pressed, he despaired of reaching the cover just mentioned, but turned directly for Hooton, where he had previously saved himself, not exactly in the usual manner, as will be noticed hereafter. He scaled the nine feet wall, at the back of the mansion, and directed his course down the plantations, not being able to make his way into the gardens.

The run had continued up to this period, one hour and a few minutes, at a rattling pace, many parts of which had been very pretty; when renard by this semi-retrograde movement, gained a decided advantage, amidst the dead and decaying leaves of the plantations, the hounds were brought to cool hunting, and continued to pick a cold scent till they reached the fine gorse cover, called Sea Rough. They became silent, though they eagerly threaded the cover; I began to think we had "done with him," when, having accidentally observed that truth-telling and gallant hound Regent, feather, my hopes brightened, and in a few seconds every lingering doubt was dispelled by a most melodious and most animating chorus. Renard left the cover, and I was fortunate enough to view him away a second time: he looked a little "worse for wear," but was still the same brushless, wild-looking animal as before. He had unquestionably lain down in the cover and rested himself during the time the hounds were picking a cold scent up to to it. The scent had evidently become worse—from some alteration in the atmosphere, beyond all question, though the change was not perceptible to the organs of vision or the human feelings; and no sooner had the hounds began to carry it, than a Chester stable-keeper and his rough-looking companion rode before them and brought them to a check. Ned Davies instantly lifted his eager family, and very cleverly recovered the scent. The hounds went well away in the direction of Burton or Denhall, for several miles, when they became mute. They made their own cast in admirable style; they were then cast by the huntsman; but it would not do. Several of the horses appeared to be quite satisfied with what they had done, and, amongst the rest, that prime little nag Tam O'Shanter (Mr. Collier's); he left the field, accompanied by Messrs. Poole, Horridge, Jones, &c. At this period Mr. Corbet, one of the sons of Sir Andrew Corbet, left the field. This gentleman has been blind

from his birth, but is, nevertheless, a very keen sportsman; he is generally well mounted; a servant rides immediately before him; Mr. Corbet's horse follows the horse ridden by his servant, and thus this gentleman gets over the fences and the country. Incapable of viewing the exertions of the hounds, it would appear that his superior auditory power compensates in a great degree his want of sight, as he eagerly enters into the spirit of the chase, rides fearlessly, and is uniformly very cheerful. A few years back the horse ridden by his servant fell at one of the fences, when this gentleman, horse and all, came upon him. Mr. Corbet escaped unhurt, but the servant was carried from the field—a little stunned, and much frightened—the man was out again in a few days.

In a cramp country, abounding with small covers, a cast back will as frequently recover a fox as a cast forward, as I have already observed. Davies made a cast back for a very considerable distance, and fortunately recovered his fox. The hounds settled well to the scent, crossing the main road on the Chester side of the village of Sutton, pointing for the banks of the Mersey, which we reached, after a run of several miles, and were brought to a check; nor should we have recovered our fox had not the hounds been lifted to a distant halloo. We reached the borders of Hooton Park, where renard began to dodge—where he began, in fact, to manifest those symptoms of distress which generally precede relentless dissolution; yet, strange as it may appear, he gave us a pretty little burst across Hooton Park, for a mile at least. He passed the racing stables, again took to dodging, and at length broke away over the open country; but very soon perceiving he could not thus maintain the contest, he turned to the left. The hounds now showed those indications which are well known to fox-hunters, and too intelligible to be mistaken; they knew they were near their game—"Their bristles are up, Sir, they're hard at him now." Renard made shift to crawl into the small village, called Poole, quite exhausted, so much so, indeed, that Mr. Congreve, jun., took him up, and held him for some seconds. Yet did the persevering animal contrive to get upon a pig-stye, and thence ascended to the roof of the adjoining cottage,—the hounds flying about, rather seeking their victim with their eyes than their noses, well aware that they were very near him, and that he he was dead beat. "A fair field and no favour;" the wily rogue was compelled to descend from his exalted situation, but was not forced into the mouth of the hounds. He crawled across a couple of enclosures to a small rough, where he resigned himself to the fate which inevitably awaited him.

From the length and duration of the run, it might have been supposed that we had changed foxes; but such was not the case; it proved the same brushless animal which I saw go away so wildly when found, which I afterwards viewed from Sea Rough, and what is more, he proved an old acquaintance.

One day during the previous season these hounds had run a very fine dark-coloured fox for some time, and lost him; they lost him, in fact, unaccountably, after going best pace for upwards of an hour. They found the same fox some time afterwards, and ran him, as before, up to Hooton Park; again he had stood up gallantly for more than an hour, and baffled his pursuers, they knew not how. In the course of the same afternoon he was accidentally discovered in an extraordinary retreat in the garden; having crept into one of the flues belonging to the hot-house. Having been deprived of a part of one of his ears, in or-

der that his identity might be placed beyond a doubt, he was set free.

After the extraordinary run just described, distinguished for uncommon gallantry, and almost unparalleled cunning on the one part, and invincible perseverance on the other, death became a very satisfactory conclusion. From first to last, the business occupied four hours; he was truly a game fox; yet had he not been favoured by the alterations of scent, he could not have stood before the hounds half that time. On examination, the separated portion of the ear was wanting; further, it would appear as if he had been afflicted with surfeit, arising most likely from the severe runs which he had experienced the previous season; and, in consequence, though the bone of his rear extremity remained, it was destitute of hair; there were other indications of the effect of surfeit, but the virulence of the disease had very evidently long ago subsided, as he was in vigorous health, and was larger than foxes are usually found.

I have often been surprised at the manner in which Ned Davies gets over the country; he is an excellent horseman, certainly; but being blind of one eye, and possessing very imperfect\* vision in the other, it might have been supposed that he laboured under insurmountable disadvantages. Sir Thomas Stanley's servants are well mounted, and there is a great degree of elegant taste displayed in his turn-out. The baronet comes to the fixture in a phaeton and pair, unless when he has company, when he drives up in a more capacious vehicle, capable of accomodating a score of his friends.

He who may visit the hounds of Sir T. Stanley, would wish to hunt pleasantly, and enjoy the cream of the run, cannot do better than make the worthy baronet his pilot, in which case he will very rarely be wrong: if he wishes to go with the *élite*, he must accompany Captain Dunn, Messrs. Humble, Cockrell, the baronet's brother Charles, Senior, &c., &c.

The last time I went through Sir T. Stanley's stables was on the 4th of January, 1833; the severity of the frost having rendered hunting impossible. On entering the hunting stable, I met Sir H. Mainwaring, master of the Cheshire splendid pack, who, like myself, had come to take a peep at the studs. Passing through that part of the building occupied by the horses ridden by the whips, we came to the stall containing the baronet's favourite his black Maximillian mare; a better tempered creature, and a more perfect hunter was never seen. By the side of this mare stood his favourite in the second degree, a very neat bay gelding that can go the pace. In the large stable I easily recognised the large powerful chestnut horse, so very clever at stone walls, or, indeed, at any kind of fence. There were two fine greys, one evidently from the Emerald Isle, the best horse in the stable, according to my judgment.

Many of the best horses which have appeared in Sir Thomas Stanley's hunt have come from Ireland, being brought across the Channel, by Mr. Thomas Hewitt, of Liverpool, the dealer. Superior horses cannot be obtained but in return for a superior price; nor does Hewitt, even as a dealer, hesitate to go to three hundred guineas for a prime piece of horse flesh. He is accounted a first-rate judge of the noble animal under consideration, and what is infinitely

more extraordinary in his profession, his character is unimpeachable.

We proceeded to view the racers. In the first roomy box were two promising foals, both chestnuts, one by Velocipede, dam Henry Masterton's dam; a strong good-looking animal, older by two months than its fellow, but decidedly inferior to it in form, and those principles of animal organization essential to the successful racer; the smaller is by Sir T. Stanley's splendid horse Battledore, dam by Phantom, out of Breeze. This well-favoured foal, at this moment, was seen under every disadvantage, being a little amiss, yet its superior form was scarcely the less discernible on that account.

The two-year-olds were next brought under review. A chestnut colt by Waxy Pope, out of Henry Masterton's dam, appeared very promising; it showed great length of sweep behind, with a handsome corresponding formation before; yet its performances have fallen very short indeed of what might have been reasonably enough anticipated from its appearance. In the adjoining stall stood a bay colt by Filho, dam Herbert Lacey's dam; one of the best Filho's I ever saw,—it did not present the leggy characteristic of the family. A bay filly by Lottery, out of General Mina's dam, did not show those points or indications of power and speed for which the sire\* is eminently conspicuous,—transcendantly superior to his cotemporaries, Mr. Batson's Plenipotentiary alone excepted. In the next stall, however, I was pleased with a bay filly by Battledore, dam by Grand Duke, out of Hooton's dam. I thought her a splendid animal: she showed immense power, was nearly sixteen hands high, but perhaps, after all, more calculated for following hounds than for successful competition on the turf. Les Graces, another two-years old, by Battledore, dam Maid of Milan, had already made an unsuccessful début.

In the next stable stood Eugene Aram, Caractacus,† Laurie Todd, Miss Lytham, a yearling, and a brother to Les Graces.

They all looked well, as far as grooming and management was concerned: but the success of their owner on the turf, for years eminently conspicuous, has of late been eclipsed. There must be a fatality in the operations of the turf, as in all other sublimary affairs, or Mr. Gully would never have represented Pontefract in Parliament, and occupied the mansion at Ackworth

\* Lottery, always ill-tempered from early life, when three years old, threw the lad who rode him in his exercise, galloped off, and was not secured again without difficulty; when he became so viciously unmanageable that his running was never afterwards to be depended on. Considered as a racer, for the development of the principles of power and speed, I regarded him as the finest horse that was ever placed before me till I saw Plenipo. Lottery was bred by R. Watt, Esq., of Bishop Burton, Yorkshire; by whom he was sold to Mr. Whittaker, of Doncaster, when, some years afterwards, he became the property of Louis Philippe of France for fifteen hundred guineas, in whose possession he still remains.

† I never saw a horse look better than Caractacus: he appeared remarkably blooming; but I must honestly confess I do not like his colour: I have an objection to a black coat upon a thorough-bred horse, it is a proof that, though the blood may have been completely purified, the wrong colour is still retained—the emblem of the original black mare. I never saw, or ever heard of, a black Arabian.

\* This excellent servant rides in spectacles fixed in the rim of his hat, and as his horses know the country, if their rider is unable to see it, he goes along fearlessly.

Park, Mr. Ridsdale lolled in a stately carriage, or Mr. Crockford have accumulated a princely fortune; but for this fatality, Sir T. Stanley must have continued his triumphant success, since, in addition to access to the best blood in the kingdom, he possesses good training ground in his own park, as well as every possible facility and advantage immediately under his own inspection.

From the beautiful and delightfully situated oval room, in what I call the south or south-eastern front of Hooton Hall, the Baronet can observe his racers take their exercise on good turf, and on a course of very considerable extent, which also affords that undulated surface which trainers deem essentially necessary to the perfection of their art; but in which I feel well convinced they are completely mistaken.

Sir T. Stanley was the owner of General Mina, Tarragon, and many other superior horses; but perhaps his two most successful, at least of modern date, were Grenadier and Dr. Faustus; and at the sale of Sir Watkin W. Wynne's racing stud, he became the purchaser of Mayfly, a very beautiful horse; but being compact and powerful, he impressed upon the mind of the spectator the idea of a hunter rather than a racer. He appeared to little advantage on the turf till he came into the hands of Sir T. Stanley, when, by the superior management of Horsley (Sir Thomas's trainer) he was eminently successful for some time. I have frequently seen Mayfly run, but I never recollect observing him attempt to bolt, though the sinister expression of the animal's eye strongly indicated bad temper. Upon inquiry I learned from Horsley, that though he might be manageable on the course, he was in the stable one of the most vicious and dangerous brutes imaginable. A bad tempered and vicious horse is never to be depended on in any capacity, either as a hack, a hunter, or a racer. Of the truth of this assertion Laurie Todd was a striking instance: he possessed superior speed and power of endurance, but no reliance could be placed upon the honesty of his exertions, owing to his bad temper. I am not aware that he was ever a winner; but I am well aware, on several occasions when I saw him, that he ought to have won, particularly over the Liverpool Aintree course, when, at three years old, he came in contact with that afterwards jade, Moss Rose, by whom he was beaten:—he swerved; and, if he would not use his utmost exertions honestly, he spared no pains to bolt. Nor, when he was afterwards reduced to the neuter gender, did it appear to neutralize his vicious disposition.

Grenadier, a large powerful chesnut horse, was a successful racer, though his action was lofty, if not lumbering: he was not the light, elastic, close-going daisy-cutter; and therefore his speed was the result of the powerful impulsion of superior strength. This horse won several races after he had become a confirmed roarer (called by our Trans-Atlantic horseracing brethren a *bull*.) I saw him win the All-aged plate at the Liverpool Spring Meeting about four years ago, when labouring under the disease just mentioned. It was a well contested race, and won by the judicious jockeyship of Simeon Templeman; who, from having ridden the horse many times, understood his disposition and mode of going, and thus contrived to pop his nose\* home before that of his antagonist reached the fortunate destination.

Dr. Faustus exhibited the genuine form of the racer and was a superior horse in every respect to Grenadier: I regarded Dr. Faustus as the best horse in what may be called the Chester district for some time; till, in fact, he met with a superior competitor in the late Mr. Clifton's Flyde\*, who bore away the Chester Cup from him, in defiance of his most strenuous exertions, accompanied with the energetically-anxious stimulation of his busy little jockey.

Yet did the Doctor acquit himself most worthily at the first Liverpool Aintree meeting:—I saw him distinctly win the glittering prize, the gold cup, though it was given against him—it proved a Yorkshire concern.

However, twenty-nine splendid gold cups, the incontrovertible demonstrations of the Baronet's triumphant turf career, ornament the sideboard at Hooton Hall.

Residing within a short distance of the city of Chester (8 miles) Sir Thomas is the most conspicuous, and the most influential, supporter of the races which take place annually under the walls of this ancient and highly interesting semi-metropolis, on the charmingly situated Roodee. For some years the Baronet was as remarkable for his success, as for the elegance of his equipage, and the beauty of the hack upon which he appeared on the ground; and if the first has somewhat deserted him, the latter characteristics still continue. It is not, therefore a matter of surprise that Sir T. Stanley should appear well in the opinion of the citizens. He served the office of High Sheriff two years ago: and when he made his public entry into Chester, he was met some distance on the road, by a very highly respectable, and by far the most numerous cavalcade that had ever appeared on a similar occasion; a striking proof of the estimation in which he is held by the inhabitants, honourable alike to the disposition of one party and the feelings of the other.

The mansion at Hooton contains a number of beautiful pictures, in some of which it is easy to recognize the towering and unequalled genius of the old masters. There are two portraits which demand attention, as well for the fidelity of the likenesses as well for their masterly pencilling; they are by Sir W. Beechey: one of Sir Thomas, when a young man; and the other of his Lady, when in the fascinating bloom of feminine beauty.

Having given a sketch of Sir T. Stanley's hunting establishment, and his racing stud; having noticed his fox-hounds and his harriers; I come consecutively enough to his pointers, which are kept in a kennel at a short distance from the house. I do not recollect observing a setter in his collection of dogs for the gun; but his pointers are of a very good description, uniting, in a great degree, the acute sense of smell for which the slow heavy Spaniard is remarkable, with activity and strength: in numbers too he is by no means deficient. He has a large extent of country, abundantly stocked with partridges and pheasants; a proof that foxes are by no means so destructive to

\* Flyde was sixteen hands high, bony and powerful; and, notwithstanding his uncommon size, his action was light, pony-like, and pretty. He was successful on the turf, and would have been very valuable as a stallion; yet was he suffered to leave this country, being purchased at the sale of the late Mr. Clifton, for the United States of America, where he must prove a very important acquisition. Flyde is the best horse ever seen on the other side of the Atlantic.

\* In the phraseology of the Turf, he *won by a nose*; that is, by the length of his nose.

these birds as the enemies of fox-hunting are anxious to have it thought. No country can be better stocked with foxes than the one under consideration; yet I have frequently seen the hounds, on entering a cover, spring a great number of pheasants, and afterwards find several foxes.

Cocks visit this part of Cheshire in considerable numbers on the approach of winter, and, consequently, good diversion may be obtained with these interesting feathered erratics. But I am uncertain in what manner Sir Thomas pursues them, whether with the small spaniel or otherwise: often as I have visited Hooton, I do not recollect having observed a springer.

The Baronet is in possession of several stout powerful shooting ponies; one of which is remarkable, not merely for its docility, but also for a degree of sagacity very unusual in animals of its kind: not only will it stand fire as steadily as possible, but, on observing the dogs come to a steady point, placing its fore feet in advance, it absolutely stops of its own accord.

Coursing may also be numbered amongst the pastimes of Sir T. Stanley: but rather perhaps as a sort of make-weight or completion to his sporting establishment, than for any deep or peculiar interest which he feels in witnessing the exertions of the long dogs. Plenty of hares are to be found in the neighbourhood of Hooton.

The country being divided from the populous town of Liverpool only by the river Mersey, Sir T. Stanley has often been annoyed by poachers, to whose depredations he is rendered more than ever liable by the operation of that crude, clumsy, and unjust jumble of legal machinery, the late Game Act. The river Mersey, by means of its multifarious navigable craft, as well as its situation, washing as it does the country in question from one end to the other, affords the utmost facilities to the views of the nocturnal depredator.

Archdeacon Clark, so regularly an attendant at the cover side, has abandoned hunting for several years; and I much regret the circumstance; nor could I for some time, reconcile myself to the hiatus caused by his non-appearance. He was a cheerful companion; and his attachment to the innocent and invigorating sports of the field, far from being inimical to his sacred profession, could not fail to elevate his character in the estimation of every person of common sense and unprejudiced reflection.

The Baronet of Hooton:—with a complete establishment for the chase in all its varieties, with a handsome racing stud, the means of gratifying every desire, an amplitude of fortune far beyond that of men of rank and distinction in general, the Prince of his country, he can scarcely fail to enjoy the perfection of human happiness: therefore, in taking my leave of him, with sentiments of unreserved and unqualified esteem, in the words of my friend, Mr. J. Aspinall, I wish him "long life," and will finish the chapter with the pithy expression of the Greek philosopher—"Thou can'st not be a god!"

---

**CULTIVATION OF CABBAGE, BY SLIPS.**—Slip off the sprouts from the cabbage stalks, let them lie a few hours to stop the bleeding, then plant them. After cutting the cabbages the sprout again affords a supply of slips for plants, and thus a regular succession of cabbages is secured throughout the year: preserving the quality of the parent stock unchanged, and doing away with the necessity of raising plants from seed.—*Gardener's Magazine.*

## SUGGESTIONS FOR IMPROVING THE MORAL CHARACTER OF THE AGRICULTURAL LABOURERS, &c.

The present state and condition of the agricultural labourers, their ale-house habits,—the depravity which so unhappily pervades that portion of society, and especially, when we reflect, that from the nature of their occupation, they should be more free from vice than any other class of labourers, their amendment cannot fail to be matter of anxious solicitude in the breast of every individual, who desires to see industry and contentment again go hand in hand through this once happy country. Although considerable good has been derived from the letting of small parcels of ground to the cottagers, yet the great bulk of that class still remain without any evident improvement; neither does it appear that any general plan has discovered itself, whereby any lasting and extensive benefits may be looked for.

And, moreover, if some considerable change for the better should not be effected, it must be feared that every succeeding year will only bring its still heavier load of evils, distress, misery, and discontent.

The writer of these suggestions has, for a length of time, been of opinion, and time has brought conviction with it, that nothing, in the nature of substantial amendment amongst this class of the community is likely to be accomplished by any other means than through the landowners; and he is unwilling to believe that objections to his suggestions, on the part of the farmers, will be numerous; on the contrary, that they will generally be found ready to unite with their landlords, under proper and reasonable arrangements, in bringing about the renewal of a custom which cannot fail to prove again beneficial to both,

The revival of a custom desirable upon every principle of moral and Christian duty; and if perseveringly pursued, under the present climax of all vice and disorder, would irresistibly cement together, and restore that esteem and respect between Landlord and Tenant, that was the characteristic of happier by-gone days. It would to the Labourer, also, prove the solicitude entertained for his welfare, and would at once strike at the evil, which is devouring by rapid inroads, every moral principle in the youthful mind.

But in order to find a remedy for the disease, the cause and the nature of it must be well understood.

That the great cause, if not the sole cause, of this deplorable state of the agricultural districts, is to be attributed to the system of the Farmers discontinuing to board and lodge their men in their houses, no one it is believed, will venture to doubt: to that change may be ascribed their rapid increase of numbers, the crowded workhouses, and their demoralized state. The men then, unfortunately, become exposed if not thrown into every vice; and a great portion of the young people, now found standing about the villages and streets, are the fruits of early connection, and improvident marriages.

But when the greater portion of the evils of the present times are attributed to this system, the Farmer who adopted it, at the period of his great prosperity, may readily be excused on the principle, that it is natural for every person to carry on his business with as much ease and comfort to himself as he can. The consequences—nay the lamentable consequences, are now visible to every eye.

The plan has worked badly.

If these views are correct, the remedy, about to be suggested, cannot fail to produce the most beneficial

and the most happy effects throughout the country ; and surely in this state of society, it behoves every one who loves his country to do his utmost to get back, if possible, this portion of the community into its natural channel.

The plan suggested is simply this,—that not only instead of reducing rents, but, in all cases, where the farmer would accept it, to give a yearly premium or bonus, for each hired Labourer, man and boy, he would board and lodge in his house.

Where a Farmer was found to decline this offer, and thereby withholds his aid in promoting the welfare of those with whom he is so immediately connected, and still prefers paying weekly wages, instead of feeding his men upon the corn raised upon his land, and the pork bred upon his farm, he surely can have no just grounds for expecting all relief, and all sacrifices, to be made by his Landlord.

In adopting this plan, it may be said, that some considerable difficulties will present themselves.

1st,—That the annual premiums or bonuses proposed to be paid, will diminish the Landlord's income.

In answer to that, the introduction of economy into the Farmer's management of his business is the best security for the payment of rent, and, consequently, must prove of equal benefit to the owner of the land. In truth, as regards the landlord, it resolves itself, into the plain question, whether the present state of the Agriculturist, combined with his future prospects, does or does not pronounce it to be a measure of self preservation, and imperatively called for.

2ndly,—The Farmer, in some cases, may require additional buildings, either a living room, or a roomy lodging room, or, perhaps, both. To this the urgency of the case must be the justification, for no farm house can be complete without such accommodation.

3rdly—The number of Labourers to be constantly employed upon the land, should be equitably and justly regulated, according to the size of the farm and the nature of the soil.—[For this the labourers Employment Act was calculated by Sir Charles Burrell and by the Duke of Richmond.]

4thly—As single men, and boys, can only be taken into the house, it must follow, as a matter of necessity, in most parishes, that on a Farm, for example, requiring eight men and boys, that, perhaps, two or three of that number must be married men, the remainder, only, of course, can be lodged, and boarded : and so on, as the case may be, to any given number.

And further, as an additional system of economy and benefit, let the married men be accommodated (as they are in Scotland,) with cottages upon the Farm.

In returning to the system of boarding and lodging the men in the house, is it not obvious, that three or four men who are to seek for separate lodgings, and who generally board separately, must take more money weekly from the Farmer than it would cost him to feed and lodge them under his own roof ; for instance, the man, who boards himself, must give eightpence for a loaf of bread, when on the farm, it might be provided at little more than five pence.

It is equally certain, that the labour of eight men may, by returning to the old system, be obtained at the cost of six, when paid weekly wages to board themselves ; a circumstance, so important to the prosperity of the occupier of the land, that it should, of itself, be a sufficient inducement for its adoption ; at the same time, it does not follow, that the Master, or the Mistress, is required to take their meals with their labourers.

A watchful eye, to see that the men are reasonably supplied with clean and wholesome food, and that good order and economy be kept, is not more than honest industry demands.

By this change, we should once more behold the happy Farmer's boy, inexperienced in vice, the picture of health and contentment ; instead of finding him, as we unhappily now do, the inmate of the beer house, listening to language often the most baneful and disgusting, and often encouraged, instructed, and led on to ruin, and to the total destruction of all peace and reputation, and becoming, even in infancy, a pest to society.

In pursuing the subject, and contemplating the vast importance of improving, in the most legitimate manner, the condition of this portion of the community ; seeing, also, how difficult it is for the Legislature to interfere in such arrangements—the salvation of the country, in a great degree, appears within the power of the great and opulent landed proprietors ; and from the high and exalted station in which many of them are placed, and from the unceasing efforts of many to improve the condition of the labouring class, it is earnestly to be hoped, that if these suggestions should be thought impracticable, or unworthy their adoption, that some more efficient plan will be applied to prevent so great a portion of the population from continuing in such a course as may bring irrecoverable ruin on the country.

The statistical accounts will show, how many may thus be drawn out of the haunts of depravity, trained to better habits, and led to a place of worship on the Sunday, instead of being left to wander to the ale house. Whatever line of policy may be adopted by the Legislature, with respect to the Agriculturist, this system must ever be the safest and most advantageous ; and may the great Landed Proprietors have the proud satisfaction of commencing, and of setting the example in this work of national necessity, of restoring thousands, and tens of thousands, to a comparative state of happiness and contentment, is the earnest wish of the writer.

For the removal of the demoralizing plan, now extensively practised, viz.—That of hiring farming servants for a less period than twelve months ; would it not be desirable, that the Law of Settlement, by servitude, should be extended to three years ; this surely would be acceptable to the farmer and would remove objections that might be raised on that head, to the re-adoption of the system of boarding and lodging Labourers.

CUSTOMS AT WHITSUNTIDE.—The customs which once distinguished the festival of Whitsuntide, are rapidly sinking into decay. Even the Whitsun-ales are now scarcely known, except in some obscure parts of the country. These formerly consisted of public diversions and entertainments, accompanied by pageants, games of sport, and other displays of festivity. In the Catholic times, and for a considerable time afterwards, every parish, more or less, took a part in these amusements, to defray the expenses of which collections were regularly made, and most of them, as at Easter and other great festivals, kept or provided dresses, and other paraphernalia, for the representation of different characters, in order to give to the celebration of these rites a more showy and dramatic effect. It was then customary for the churchwardens of every parish to provide twenty quarters of malt, which were made into very strong ale or beer, and then sold at a cheap rate in some place fixed for the purpose.

## OBSERVATIONS AND EXPERIMENTS PROVING THE PARR OR BRAND- LING TO BE THE YOUNG OF A VARIETY OF THE SALMON.

By MR. JOHN S. MILTON, SURGEON.

Communicated by Dr. KNOX.

(From the Quarterly Journal of Agriculture.)

After the numerous interesting papers which have been communicated to learned societies on a subject apparently involved in such hopeless obscurity as the natural history of the salmon, I must, in excuse for venturing to enter upon this subject, assure my readers that I shall not venture to occupy their time by adducing any theories or particular views, but simply by endeavouring to submit to their consideration the conclusive results of some experiments which demonstrably prove the *parr* or *brandling*, to be the young of a variety of the salmon.

Individuals acquainted with the rivers of this country, have long been aware that many varieties of the salmon exist in these waters, such as the *Salmo salar*, or common salmon of the market; the *grilse*, the *sea-trout*;—and, about their mouths, the *whiting*, and the *yellow fin*,—some of which are presumed to be the fry in an advanced state of growth, as the *yellow fin* and *grilse*; and others, as the *sea-trout* and *whiting*, are known to be found with milt and roe, in a condition for spawning, and supposed to be distinct varieties of the genus.

Of the young or fry of all these, we know little farther than that, at a certain period, and for a short time, vast numbers of small fish, of similar aspect, and passing under the designation of *smelt* or *smolt*, are found in the streams where the various species of salmon have spawned, and under those names are protected from destruction by the authority of the legislature. But in consequence of scientific persons having been unable to prove that the shoals of small fish called *brandlings* or *parrs*, are the spawn of the salmon genus, no protection is provided for them in our act, and millions are annually destroyed by the anglers alone in their sport.

The consequence is, a yearly decrease in the supply of salmon, naturally induced many persons connected with the fisheries, to attribute the failures to the destruction of the spawn; and Mr. Peat, the farmer of the Earl of Lonsdale's fisheries, on the Derwent, instituted some experiments on the *parr*, which are now offered to public consideration, under the assurance that, if the members of our learned societies consider them of the importance they seem to possess, they will give the subject their deliberation, as to the readiest means of remedying the evil of the destruction of the spawn of a fish, which was once the food of the peasant, and can now scarcely be purchased in many places by the rich.

Mr. Peat had long been in the habit of performing a number of experiments, something similar to those made by Mr. Hogg, on the part of the Yarrow, and had invariably arrived at the conclusions that this little fish became larger, descended to the sea, and returned, in process of time, of considerable weight, size, and of excellent flavour, when it was sold as a salmon in the markets he supplied.

A gentleman residing at Workington, who derided these assertions, captured some *parr*, and deposited them in a pond in Mr. Saheld's yard. Nearly twelve months passed over, and these fish,

when taken out, were found to be entirely altered, having attained a considerable size, assumed the scaly appearance of the smelt, and bearing the evident marks of growing, though diseased fish. Not satisfied, however, with the result of this experiment, which he conceived might not have been properly superintended, he repeated it; and, in the presence of witnesses, with the same conclusion,—these *parrs* showing the appearances, from their great length, narrow shoulders, and large eyes, of creatures during the process of their growth. Of course, nothing is easier than to raise objections to the results of this inquiry, by doubting the individual's knowledge of the characteristic and distinguishing marks of the fish he confined; but although it must be acknowledged that many of the trials have been inconclusive, from the ignorance of the persons superintending them; yet I am fully satisfied, from the unwearying researches I made through Cumberland, that I have not one iota of speculation to advance, or one circumstance to relate, that cannot be substantiated by persons of undoubted veracity, and men who have fished the waters during a long life.

Instigated by the happy result of this trial of his friends, Mr. Peat, in conjunction with William and Joseph Dickinson, Esquires, surgeons, of Workington, placed a number of the impregnated ova of the salmon in tumbler-glasses, and succeeded in bringing to life three different breeds in different temperatures. Two were lost from incautious treatment, but the other breed, consisting of three fœtal fishes, lived during nearly three weeks attached to the ova by the umbilical cords, on the separation of which they expired, for want of their natural food. One of these animals attained the length of an inch, displayed the characteristic marks of the *parr*, and sported and played in his element with astonishing vigour and strength.

The relation of these circumstances to me by Mr. Peat, induced me not only to make them known to the public, but also to collect a considerable mass of corroborative evidence from other sources, and to pursue some anatomical inquiries on the *brandling* or *parr*, which were all equally conclusive of its growing to be a salmon of a species which I shall endeavour presently to point out.

A curious and interesting accidental occurrence furnished a gentleman, Mr. Harris, of the Goat, near Cockermouth, with an opportunity of placing it beyond dispute, that the *brandling* or *parr* is hatched from the ovum of the salmon. On digging into some sand-beds in the Derwent, during the latter part of a dry summer, that gentleman found, near the surface, innumerable *parr* lying dead, and varying in size from two to three or four inches. On proceeding farther down, he discovered to his surprise the *parr* of smaller size attached to such large ova as must have belonged to a salmon or large salt water fish alive, although in gravel only just moist. The deeper he dug the less the fish became; and, at the depth of a yard, he found thousands of the impregnated ova, in all stages of progression towards the fœtus, being hatched. In some only the eyes were visible; in others the eyes and the spinal column, coiled up in the egg; and, in many, the diminutive creature attached to it by the cord.

Some of the largest of these attached to the ova, and some of those separated from it, Mr. Harris collected, placed in a washing-tub, and kept alive for several weeks. They presented to the most careless observer, the lateral bars or *finger-marks*

of the *parr*; and, out of the many persons who resorted to see them, no one ever pretended to dispute that they were the fish so abundant in that river, under the name of *brandling*, and so plentiful in the salmon rivers of Scotland as the *parr*.

As these sand-beds have always been a celebrated resort of the salmon for spawning during the winter months, when they are covered with water, Mr. Harris was induced to repeat his researches; and, singular to relate, discovered precisely the same results; and I hesitate not to say, that, with the sanction of any of the learned societies, specimens can next summer be forwarded of the fish in all their different stages of growth, from the ova deposited at the bottom of the spawning grounds of the salmon, to the brandlings lying dead during a dry summer on the surface. With the first autumnal flood, those which have not been destroyed free themselves from the ova; and I myself have caught the *parr* during November in this river, little more than one inch in length. Of course, a circumstance of this kind, supported as it can be by incontrovertible evidence, is sufficient to determine that the *parr* is the young of a large fish, of the *salmo* genus; and I should not consider it necessary to advance any further evidence, but that the following circumstance may, in some measure, show how slowly a fish in confinement, and deprived of its liberty to migrate and feed according to its natural laws, must necessarily grow.

Mr. Peel of Stanger, a gentleman well acquainted with every description of fresh-water fish, had some years ago an excellent opportunity afforded him of remarking the changing of the *parr* to the salmon. Having prepared a number of *parr* out of the river Cocker, in the month of June, long after the smelts had descended to the sea, and being prevented from using them for pike baits, as he had intended, he placed them in a gutter of one of his fields, in a situation from which they could not escape, where for a long time they were entirely forgotten. At the expiry of two years and one month, while engaged in his fields, Mr. Peel was attracted to this gutter by a splashing sound—remembered his *parr*—and to his astonishment discovered that they had grown to be long, lean, scaly fish, much of the appearance of the *parrs* as described above, and most of them suffering under disease of the gills. Mr. Peel had always maintained the common prejudice of his countrymen, that a *parr* or brandling was born a brandling, lived a brandling, and died a brandling; and of course was considerably astonished at seeing all his views so completely upset, being so thoroughly satisfied that the brandling increased in size, and became a large fish, although of what precise variety of the salmon unable to determine.

Mr. Bowman of Carlisle, and Mr. Bird, the proprietor of the Kirkoswald Fisheries, performed experiments on the *parr*, which led to exactly similar results; and the Rev. Mr. Wybergh of Isell Vicarage, who had always maintained very opposite views, had lately reason to acknowledge the certainty of the change occurring in the *parr* to a larger fish, by observing it on some which were accidentally washed into his fish-pond, and retained there for a considerable time.

I could advance many more instances of a similar kind, where individuals have had the truth forced upon their notice by accidents and circumstances, the importance of which it was impossible to deny. But as I feel assured I have simply related a few facts proving the *parr* to be the young of a larger fish, which cannot be denied, I shall

endeavour to show that it is the young of a variety of the salmon frequenting our streams.

In the first place, negative evidence acquaints us with the curious facts, that *parr* are never to be found in rivers unfrequented by salmon; and, although Dr. Knox has proved that they do not now exist in the Whitadder, where some species of salmon abound, they yet always may be discovered in the waters inhabited by all our varieties of the salmon.

An excellent example of this occurs in the Derwent and the Ellen, two rivers of Cumberland, both discharging their waters into the Solway, within five miles of each other. In the Derwent, every variety of the *salmo* abounds; and there the *parr* is found in innumerable shoals. But in the Ellen, where only the square-tailed fish, commonly called the sea trout, locates, no individual ever beheld a *parr*, although, in the spring, the smelt of this sea-trout is plentifully caught.

I am aware that it has been asserted in a note in this Journal, on Mr. Hogg's paper\*, that, somewhere in the Western Isles, *parr* are found, and not salmon; yet I beg to submit to consideration, that these streams may have been very partially examined, and that they may assimilate to some of the small rivers which I have fished in Yorkshire; where, owing to the minuteness of the stream, the salmon frequently only make their way a short distance up from the coast, deposit their roe, and disappear immediately; and in these streams, at a great distance up towards their insignificant sources, I have caught abundance of *parr* †.

From attentive consideration to these points, and from all the information I could ever collect on the subject, I am disposed to believe that, wherever all the varieties of the *salmo* genus abound in any one river, we shall there certainly have the *parr*; and I hesitate not to challenge a refutation of this assertion, by clearly defined and substantiated proofs. If this be admitted, then we arrive at the conclusion, that the *parr* is, in some measure, connected with the salmon, and, as I have proved, the young of one of its varieties; and it only remains to determine to which species it belongs.

In the second place, the positive evidence of most of the experiments which have hitherto been performed upon the *parr*, prove that it becomes a larger fish, descends to the sea, and returns, after a certain period, of various sizes and appearances.

Mr. Hogg, it will be remembered, in the paper alluded to above, marked a number of small fish, which, at the moment of taking them, he considered *parr*, and informs us that many of them were subsequently caught in the Tweed and Yarrow, some as sea-trout, and others as salmon. This inconclusive evidence, however, is by no means original with that gentleman.

The grandfather of the present proprietor of the Derwent Fisheries, so long ago as the memorable year 1745, commenced marking the brandlings and smelts occasionally caught about his fisheries; and ever since that period, first his son and then his grandson, continued to mark them, by removing the dead fin, back-halving and fore-halving the tail, and invariably succeeded in having some of them, at subsequent periods, for sale on their fish-stalls, when arrived at a considerable size, and weighing about 20 lb.

\* Vol. iii. p. 449.

† I never thought that *parr* had been observed near the sources of rivers.—Dr. Knox.

Such results, however, led to very little knowledge of the disputed points; for I must observe, that, while Mr. Hogg and others call the fork-tailed fish the salmon of the Tweed, Mr. Peat declares the square-tailed fish to be the real salmon of the Derwent, and showed me a drawing of one upwards of 70lb weight. The gilse or grilse of Cumberland is fork-tailed—the *sea-trout* square-tailed, but seldom reaching a weight of 12lb; whereas I myself lately forwarded to Dr. Knox the vertebral column of a salmon of 25lb weight, in which the tail was as square as if formed by a rule.

While such differences of opinion as these exist, I cannot pretend to offer an assertion as to the name of the exact species of salmon which the *parr* becomes: nor, as long as the experiments on the fish continue to be performed in such an unsatisfactory manner as removing the dead fin, or back-halving the tail, can anything be defined of the period of the growth and the habits of the fish; for while one person is marking a fish for scientific researches, perhaps another is wantonly inflicting the same memento on two or three dozen varieties of spawn; which I have done during many a summer day, and which I have heard old fishermen remark they have been in the habit of doing on the Derwent for upwards of fifty years. There is a circumstance related, with all the gravity of truth, in the *Encyclopædia Londinensis*, which has only to be read to convince the most credulous how ridiculous it is to rely implicitly, without examination, on whatever is advanced. A Frenchman is there stated to have placed rings of gold or silver wire through the tails of smelts, which proved so accommodating as to return at the exact times for enabling the enthusiastic Frenchman to determine that the smelt required six years to become a salmon, during which term he inflicted on the young fish such names as *morts* and *sprods*, *yellow-fins* and *whittings*,—not at all aware that, in many parts of England, the *morts* and *sprods* mean, and had meant for ages, *yellow-fins* and *whittings* themselves!

Under all these difficulties, I resorted to dissections of the fishes, with the impression that the deep anatomy could certainly furnish me with some conclusive results; and I have had the proud satisfaction to discover that my surmises were not altogether incorrect.

It is certainly true, that naturalists have already presented us with an anatomy of the salmon; and have very minutely described the various organs of the fish. But, I think, when we remember that in the *Encyclopædia Londinensis*, which contains a pretty faithful summary of the conclusions of the principal naturalists who have written on this fish, it is there asserted that the *Salmo salar*, or common salmon, has only thirty-six vertebrae in his back bone, and when Dr. Knox and others, who, as comparative anatomists, will bear me out in the assertion, that there are sixty vertebrae, instead of thirty-six, in the back bone of all the varieties of the salmon, we cannot place any very implicit confidence in the assertions hazarded by these persons, who, after all, merely pretend to give a detail of parts as they appear, and not to draw any conclusions or classifications from the structure of the fish, which we are certainly generally accustomed to regard as the principal value of the comparative anatomist's research.

The number of rays in the fins, considered by these naturalists likewise of so much importance, I do not myself attach the slightest regard to, as some of them are so cartilaginous and indistinct, that I am not sure if any two persons can number

the same; and in the infant fish, of course, it is impossible to count them; and even when we can, there appears nothing, structural or numerical, to characterize them from those of many other fish, and all the varieties of their own kind.

Accordingly, I looked to the feeding of the animals, and the structure of their generative organs, to afford me some clue; and on proceeding with my examination, I was astonished to find, that while the stomachs of the square and fork-tailed salmon, called in Cumberland, salmon and gilse, were invariably apparently empty, the stomach of the sea-trout was just as constantly stuffed with flies, worms, and other particles of common and gross food, which induced me to set it aside as a coarse feeding variety. But the remarkable similarity of habit, in the feeding of the others, led me to examine minutely the structure of the fork-tailed salmon (the gilse), and of the square-tailed or common salmon, expecting to find their deep anatomy precisely the same, although the superficial anatomy displayed the broad difference of the fork and square tail; but, to my great astonishment, I found a marked and perfect distinction in the generative organs, where I looked for them agreeing in every respect.

In the square-tailed salmon I found two beds of roe of *unequal length* lying *one below another*, and containing ova of *unequal magnitude*, the short bed being only one-half the length of the long one, but containing an egg of double the size. On inquiring of Mr. Peat, who had been accustomed to open thousands of fish, he told me that the beds of roe *invariably* differed in size, and lay one below the other in the salmon, but that at a certain period of gestation, the ova became *more nearly equal in their bulk*.

In the generative organs of the fork-tailed salmon, precisely the reverse of this order is displayed. There two beds of roe are found of *equal length*, and *lying parallel to each other*.

Of course, I immediately procured and dissected a number of *parr*, and there I found exactly what I expected, that this little fish, which in its superficial anatomy precisely resembles the fork-tailed salmon, resembled it as closely in the structure of its generative organs, having the two roes lying in equal and parallel beds. The roe is rudimentary, and the ova must be seen through a magnifying lens at certain seasons; but during the autumnal months, the beds have arrived at such a growth, that the ova may most distinctly be seen and counted with the unaided eye, and in this advanced condition I presented some to Dr. Knox a short time ago.

These, I think, it must be allowed, are essential and marked features in the anatomy of an animal, which are too momentous to be lightly thrown aside. I consider that every known circumstance of the habits of the *parr* proves it to be the young of a migratory fish like the salmon; and I see in the anatomy the most pointed dissimilarity from every fish in the river but one, and to that I find it approximate so closely, or rather resemble so precisely, that I must now venture to pronounce it to be the young of a variety of the salmon, a fish that, in the rivers of Cumberland, attains a great weight and fine flavour; and which, when taken out of the Tweed, is, I understand, sold in Edinburgh Market, under the general designation of salmon, and considered the finest description of fish.

If, then, these curious facts cannot be disproved, it will no longer be considered extraordinary that the supply of salmon should have decreased from

rivers, in the neighbourhood of which no adequate increase of population accounts for the difference. On the Derwent, there cannot now be taken a tithe of the fish formerly caught. But it is an ascertained fact, that the brandling or *parr* is, as the salmon decreased, not only more closely sought after by the angler, but more fearfully devastated by the poacher with his nets.

If, however, this fish were preserved by the authority of the Legislature, and the privileges of the angler in a compensatory degree enlarged, the results would in every probability be satisfactory in the extreme. Learned societies can, either by a recognition of the truth of these statements, determine the *parr* to be the young of a variety of the salmon, and by so doing, show the importance of the inquiry to the Legislature of this country; or by instituting a series of experiments, which I can assure them may be performed at a very trifling expense, possess the means of placing the matter for ever beyond dispute.

### TO THE EDITOR OF THE "FARMER'S MAGAZINE."

"Now he (Lord John Russell) sympathised with the farmer most sincerely, and he could not but think that a reduction of rent would be the most effectual of all relief which could be administered to him."—*From Lord John Russell's Speech in the House of Commons, on Monday, May 21, 1835, in reply to the motion of the Marquis of Chandos "for an Address to his Majesty for a removal of some portion of those burdens to which the land is subject through the pressure of general and local taxation."*

Sir,—Since the day on which Lord John Russell made his speech in reply to the Marquis of Chandos, and from which speech the above extract is taken, the agricultural interest has experienced a two-fold defeat in the House of Commons; namely, on the above occasion, and also on Mr. Cayley's motion "for a Select Committee (based on the Parliamentary report of agricultural distress), to enquire if there be not effectual means within the reach of Parliament to afford substantial relief to the agriculture of the United Kingdom, and especially to recommend to such Committee the subject of a silver or conjoined standard of silver and gold." First, in regard to the motion of the Marquis of Chandos, I do not think that any very material benefit would have accrued to the landed interest from the success of the measure, although undoubtedly it would have been an acknowledgment on the part of the Legislature of the existence of such severe distress on that particular interest of society that required not only peculiar attention for the future but also immediate assistance.

But I am sorry to say, it does not appear to me that either the Government or the House of Commons, as a whole, seem disposed to view matters in this light, but are rather inclined to leave this vital interest of the community pretty much to its own fate, and that, too, under circumstances the most difficult and oppressive that can be imagined to bear down on any particular interest.

Let us now consider the practicability of Lord John Russell's recommendation of a reduction of rent as the "most effectual relief" which can be afforded to the farmer. When his lordship speaks of relief to the farmer, he of course means it to apply generally, and not to any one description or class of farmers;—in fact, if it means any thing at all it must, in its application, extend, in

the relief it contemplates, to *all owners and occupiers of land*, who would be relieved "by the removal of those burdens to which the land is subject, through the pressure of general and local taxation," and if his Lordship did not intend his observation to convey so extensive a signification, then it was no answer to the Marquis of Chandos, for he spoke of the depression on land generally, and consequently his words fairly imply an allusion to the difficulties experienced in common by the landlord, tenant, and labourer, and are in no degree confined to the occupying tenant. However, let us pass by the circumstance, that his Lordship prescribed a specific for the tenant only, and that, too, to be derived from the pocket of the Landlord, who is a suffering party in an equal degree with the tenant, and proceed to enquire if his Lordship's remedy would not, on the whole, be found to be miserably deficient in affording assistance to the great body of persons whose distress is immediately connected with "the burdens to which the land is subject." First, the owner and occupier, a yeoman, who purchased his estate during the operation of the Bank Restriction Act of 1797, when wheat was about twelve shillings a bushel. How, I would ask his Lordship, is this farmer who feels "the pressure on land" of which the Marquis of Chandos spoke in an especial degree, to be relieved by a reduction of rent? I know many such instances:—here, the rent—and a high rent, too—is paid in the shape of interest to the mortgagee, who advanced a sum at the time of purchase, equal to the *half value* of the property, but which now, from some strange turn in affairs, is become somewhat beyond the full value of the estate. It is idle to say men so situated can be relieved by a reduction of rent.

We will now take the occupier of a poor, heavy, and wet wheat soil, where the rent, even if it was paid, forms but a small part of the outgoings of the tenant. I will instance a farm in the Weald of this county of about 200 acres, which was taken on lease when wheat was about fourteen pounds a load, at a rental of 80*l.* per annum, and which farm will produce from twenty to twenty-five loads of wheat yearly. Now, this land, as I have before said, was taken at the rate of 14*l.* a load for wheat, and at the present time the price of wheat is from 9*l.* to 10*l.* per load, consequently the rent is at once sacrificed, and, in truth, no rent will be paid this year, but still the tenant will be a loser by his occupation, *although he will not pay one farthing of rent.* Oh! how I should like to hear the landlord of this farm read Lord John Russell's speech (in answer to the Marquis of Chandos) to his tenant! and more particularly I should like to watch the countenances of the two men when they came to the paragraph which is copied off at the beginning of this letter. How would they—smarting under the lash, as they are—contain their indignation and insulted feelings at such a puerile suggestion coming from a high officer of State! I am sure it would require all the authority of the Squire—and I doubt if even his authority would be sufficient—to prevent his tenant applying a certain monosyllabic epithet to the author of such trash, very unbecoming the dignity of a Cabinet Minister; indeed, such would be the feelings of the tenant of every poor farm in the kingdom, because he knows that his rent forms so inconsiderable a portion of his yearly expenses that it would be impossible to give him adequate relief from that source, even if his landlord relinquished all claim to rent.

We have now to speak of the tenants of good

land, whose rent forms a great proportion—perhaps a third—of their aggregate expenses, and these are the description of farmers who alone can be essentially relieved by a reduction of rent. Instead of paying a rent of 80*l.* per annum for two hundred acres of land, here from 200*l.* to 400*l.* will be paid, and, under such circumstances, it is of course obvious that the landlord, if he be in a situation to afford it, may materially assist his tenant. Then, again, it will be rarely found to occur that the landlord can afford to reduce his rent to any extent. The landowner has his difficulties to contend with, equal generally to, and very often far beyond, even the difficulties of his tenant. Now, his Lordship appears to me entirely to overlook this fact, and speaks of agricultural distress as if it was confined to the occupier of the soil only, when it is proverbial that all owners of land whose estates were purchased during the fifteen or twenty years immediately following 1797, are oppressed beyond measure by existing state of things, and all men so situated, from the duke to the yeoman, with the tenants of poor land included, will, I am sure, agree with me, in the conviction I feel, if his Majesty's Government cannot devise other means of relief to the agricultural community than that to be derived from a *reduction of rent*, into the gutter that class of persons must be tumbled, leaving the "wall-side" to money-dealers and Jews, who are recognised in the debates of the House of Commons as the "moneyed interest."

The principle of Mr. Cayley's motion appears to me to be the only practicable, legitimate, and sufficient source of relief to be adopted; viz., an increase of the circulating medium of the country. This, too, has been rejected by the House of Commons, and denounced by Sir Robert Peel as a breach of faith towards the public creditor, which sentiment of the Honourable Baronet's was of course highly approved of by the "moneyed interest." *Disinterested men!* Yes, if they keep the national faith according to their own, and to Sir Robert Peel's acceptance of the term—only let them succeed in this object—and then 'faith' they (the "moneyed interest") will soon get possession of the estates of the present landed gentry and the House of Commons 'to boot.' On the other hand, if the national faith be kept by paying the public creditor the interest of his claim in the same currency in which it was advanced as a loan to the Government, then, indeed, the agricultural interest may fairly expect to derive that relief which will be looked for in vain so long as the interest of our immense debt is paid in an enhanced currency. Our sober, enterprising, and industrious national character, together with the elasticity of our resources so much depended on by the "moneyed interest," and blue-stocking politicians, to work a cure for all our difficulties, if but left to themselves, is somewhat like muzzling a bull dog and leaving him to the fury of his cornigerous antagonist, with a full dependence on his former proved courage and sagacity in combat, to vanquish his formidable enemy, although deprived of all means of defence. I am, sir, your obedient and very humble servant,

Sussex, June 15, 1835.

AGRICULTOR.

### ON REDWATER IN CATTLE.

BY MR. J. D. HARRISON, V. S., LANCASTER.

(From the *Veterinarian*.)

The season when redwater becomes prevalent, at least in this neighbourhood, drawing nigh, I

have ventured to trespass upon the pages of *The Veterinarian*, and, perhaps, a little upon the patience of its readers, whilst offering to their consideration some facts connected with that disease. They may operate as a stimulus to the minds of other practitioners in the prosecution of further and more accurate research about this matter; and whereby we may hope ultimately to arrive at the much-to-be desired object, of a perfect development of the true seat of this complaint. There are, and, I trust, always will be found, a few veterinary surgeons who do not confine their inquiries to the diseases of horses alone, but are anxious to extend the benefits of science, and may I not likewise add humanity, to all domesticated animals. In the foremost rank of these, in point of public wealth and utility, stand horned cattle; than whom, when labouring under disease, no class of animals have been so grossly neglected, and their sufferings so much increased, as well from the cupidity and bigotted prejudices of their owners, and the ignorant, self-taught, and self-elected cow doctor.

In *The Veterinarian* for May, 1833, I hazarded an opinion as to indigestion being the cause of redwater, and the digestive apparatus its probable seat. I did it then, as I now do, under the heartfelt wish of eliciting inquiry, but not controversy, in order to arrive at the truth; for, at that time, not having what I conceived to be any undeniable solid foundation, and from the absence of many facts which I now possess, I was deterred from persisting in the defence of that theory, determining, however, at some future period, to return to the subject.

That redwater was not primarily an affection of the kidneys, I had long suspected; and I had observed either the non-effect or the mischievous effect of the diuretics and astringents generally resorted to and used by cattle doctors. This observation gradually led me to look to other and more important organs for an elucidation of the matter; and the digestive organs, as partaking of a greater and peculiar complexity of character presented themselves to my mind; and in connexion with them the disease, throughout its various stages, was narrowly watched: it soon became sufficiently evident, that to them alone the disease is entirely referable.

Diarrhœa, I do not hesitate to say, is invariably the premonitory symptom. Neither before nor during its continuance is the urinary discharge altered; and the administration of a mild purgative during this stage will, in the generality of cases, prevent all unpleasant consequences. From this fact alone, if others were wanting, we might justly conclude that the digestive organs were disordered, and look upon the diarrhœa as one of Nature's resources and curative indications. It is, however, too frequently the case, that the diarrhœa is not seen, or if seen is disregarded, and this favourable opportunity is allowed to escape; and then constipation, so universally known and as universally feared, ensues: the urine becomes tinged, and, as the constipation becomes more confirmed, gradually acquires a darker hue—nay, I have even seen the milk itself partake in the discolouration, when the stimulus of medicine has failed in alleviating the obstinacy of the bowels.

On these grounds I infer, that from an undue and vitiated secretion of bile redwater is produced, and that purgation, at the onset, is consequent on this vitiated secretion. That the bile becomes absorbed and taken into the circulation, is likewise evident from the obstinate, and in too

many instances fatal, constipated state of the intestines, and the yellow tinge of the tunica conjunctiva; and still more strongly from the fact, that the very milk (when any is secreted) as well as the urine, are saturated with bile. This latter circumstance I have clearly and satisfactorily proved by analysis; an ounce of urine being found to contain rather more than one-fourth part of bile. It is likewise demonstrable, but in a less satisfactory manner, from the action of purgatives; for I have personally witnessed several cases, in which the water has become clear after the administration of physic, and two or three hours prior to the commencement of the purging; and this, I have generally regarded as a favourable omen.

### RUPTURE OF THE PERICARDIUM, WITH EXTENSIVE DISEASE OF THE LUNGS, PLEURA, &c. IN A HEIFER.—CHRONIC DISEASE OF THE HEART IN A COW.

BY MR. E. A. FRIEND, V. S., WALSALL.

(From the Veterinarian.)

On the 16th March, 1834, I was sent for by Mr. Wright, of Stonnall, near Lichfield, to examine a heifer that he had purchased about a fortnight previously. I found her much emaciated, the hide tight, and the coat staring; the eye sunken, with total loss of appetite, and the fæces of a dysenteric kind, together with a considerable affection of the thorax, but of such a nature that I could not ascertain its precise character.

He requested my opinion as to her soundness at the time he had purchased her, he having had her (with others bought at the same time) warranted sound. I told him at once that I had not the slightest doubt of her having been decidedly unsound long before the time of purchase, and advised him instantly to write to the party from whom he had her.

I grounded my opinion at that time partly on the general appearance of the animal; partly on the nature of the fæces, which, when discharged, were covered with small gaseous globules, strongly indicating chronic disease of the mucous membrane of the intestines; and partly from the affection of the chest, which, though of a mixed indefinite character, yet appeared to me to be chronic: but more particularly I was led to this consideration from the appearance of the hide and coat. There is a peculiar sympathy in the skin with chronic disease of the thoracic and abdominal viscera; and in this case the hide was tight to the feel, and the hair bore the same resemblance to the bloom of healthy hair, that old thatch would do to reed newly cut. I sent some medicines for her, with directions for their exhibition; and on the 28th instant I received a note from him stating that, during the time the heifer had been taking the medicines, she had been very much relieved, but that she had relapsed again. As soon as they were finished I then sent him some more, with further directions.

I saw Mr. Wright again on the 9th April, and he then told me that the cow was better in her body, and that her appetite had improved very much, but yet that he thought her otherwise no better.

I saw her again myself on the 14th, and there was an improved appearance in the coat, a brighter eye, a much better appetite, and the fæces such as would be voided by a cow living on the same food, in a state of perfect health: but the affection of the thorax was decidedly much worse; there was considerable œdematous swelling on the dewlap and the integuments under the jaw, and I immediately detected effusion into the cavity of the chest. I told Mr. Wright of this, and the immediate danger to life consequent upon it. The event justified the prediction; I went again on the 16th, and found her dead.—The following were the appearances that presented themselves at the post-mortem examination: The first three stomachs were healthy, with a due portion of food in them; the fourth stomach was slightly inflamed, with a quantity of dirt, and several small pieces of coal or cinders in it; there was also a nail, a pin, and a small piece of wire in the first stomach. The intestines had recovered their healthy aspect in a great measure, but there was a small quantity of serous fluid in the cavity of the abdomen. Upon opening into the thorax, about two gallons of purulent fluid escaped. The lungs were in a state of complete collapse, and not more than half their natural size, and were completely attached to the ribs by a diseased secretion from the plura. The most extraordinary appearance, however, was exhibited by the pericardium: a portion of it was found closely adhering to the left side of the heart; on the right side there was a rupture of it, forming a foramen of an inch and a half in diameter, and it appeared as if the edges of this opening on one side had receded upon the surrounding parts. Adhesive inflammation had taken place, and there was a complete duplicature of the pericardium, which was altogether thickened and indurated to such an extent, as to present the appearance of tanned leather.

Here, then, at any rate, I had firm ground for my original opinion of long-existing chronic disease. The pericardium did not exhibit that intense vascularity that one stage of acute inflammation would produce; nor was there that tendency to decomposition that would be the effect of a still greater extension of the same kind of inflammatory action, but there was, instead, a firm indurated half-organized substance, of fifty or sixty times its original thickness. Now, in the first instance, when this comparatively delicate membrane (from the disease consequent upon its rupture) had lost its healthy secreting action, a diseased one would be set up in its stead, and a deposition upon the whole of its internal surface must have taken place. A partial organization of this must have followed; and this deposition, covering the original secreting surface, must have itself become the secreting surface. A fresh deposition must then have taken place, and a fresh organization have followed, and so layer after layer were added, till it became the hardened indurated mass which were exhibited on dissection; this I considered, and I was confirmed in my opinion of its long duration.

I gave Mr. Wright a written detail of the case, and my opinion upon it, of which the following is a copy: "that the primary disease in this case was of the pericardium; and that so extraordinary was the extent of disorganization which had taken place, that it was matter of absolute certainty that it could not possibly have been effected, except under a disease of several months' continuance: that the disease of the abdominal viscera

(but which yielding to the power of medicine) was a consequence of this excessive derangement; and that the immediate cause of death was from suffocation, produced by the enormous quantity of purulent fluid latterly secreted.

I advised Mr. Wright to send a copy of this case, and opinion, together with the hide of the animal, after putting his brand-mark upon it, to a friend of his that lived in the neighbourhood of Mr. Thomas, the cattle dealer of whom he had bought the heifer, and to desire him to deliver the hide, and to allow Mr. Thomas's veterinary surgeon (if he employed one), or if not, the family surgeon, to peruse the case, and I thought that he would not find much difficulty in getting the matter settled. He did so, and Mr. Thomas honourably paid him for the heifer, and expences; but having had her in his possession only three or four days prior to selling her to Mr. Wright, he naturally turned to the party of whom he had purchased her for repayment likewise: this was refused, and the matter went into a court of law, and I received a subpoena to attend the Shrewsbury assizes, in March, to give my evidence. This in a few days was countermanded, and I have since learned that the defendant had agreed to pay all the debt and costs.

I send you this case for various reasons: in the first place, I consider that even a simple record of extraordinary cases that occur in veterinary practice (though they should be given without note or comment) is extremely valuable. For who, when he is standing by a suffering patient, that cannot inform him of the nature of the pain that is tormenting him, when every eye is turned upon him, and every one looks to him for the expected explanation or prognosis, when, perhaps, the symptoms are such as to set all ordinary calculation or explanation at defiance, and the whole of his previous practice furnishes him with no parallel case; I say who, at such a time, would not be glad to cast back the eye of his mind over the many valuable records that he remembers to have read in the pages of *The Veterinarian* for instance, if haply amongst them he may find something in the practice or experience of others to help him out? And though he may not be able to save the patient, yet the very knowledge of this circumstance, coupled with the fact of his being aware of the chances of disorganization in certain parts of the animal frame, will give him a deserved consequence with his employers, and entitle him to such a share of their confidence as he might find it difficult otherwise to obtain.

In the second place, it is one which was likely to have occupied the attention of a court of justice; and, as I should in that case have been obliged to state my opinion publicly, I do it now without hesitation, for it may possibly serve some of the profession at a future time, who may be employed in a litigated case, connected with cattle practice, as something to refer to, by way of precedent; and I will not do your readers the injustice to suppose that they will be inclined to slight the end on such an occasion, because the means were humble.

In the next place, I do it for the purpose of introducing a medicine which I gave in this case, and which I never remember to have seen or heard recommended for the purposes for which I give it, but which I have found the most efficacious of any that the whole range of the *materia medica* has afforded me, for stimulating the digestive system generally, increasing the appetite, and restoring the very important function of suspended rumina-

tion. It is *pulv. cantharidis*, in doses of fifteen to twenty grains, combined with carbonate ammon. from one to two drachms: these, with ginger and gentian (medicines commonly used for the purpose), will be found on trial so valuable, that I feel sure that I do not arrogate to myself more than those who have the opportunity of giving it a fair trial will willingly award me, when I say that I anticipate in some little degree the thanks of that part of the profession who are engaged in cattle practice for its public introduction.

In the last place, I do it to substantiate a fact in the pathology of cattle that I have frequently noticed, viz. that so powerful is the digestive system in them, and so capable, in a state of health, of supplying waste, and repair that disorganization, even in the most vital parts, may go on to an astonishing extent without affecting life, and even sometimes without interfering materially with the actual improvement in the condition of the animal. I have seen large abscesses in the liver of a *fat cow* killed by the butcher, and other affections of the same kind that could not co-exist in the horse with the necessity for that active exertion that is generally required of him. Further to illustrate this, I subjoin the following case of

#### EXTENSIVE CHRONIC DISEASE OF THE HEART.

About a year and a half ago I was sent for to a cow, belonging to Mrs. Swift, of Aldridge, about four miles from hence; I found her down in exceedingly great pain, with a most alarmingly quick and strong pulse, a wild and haggard eye, and the head turned back on the side, indicating pain in the region of the abdomen. I bled her, and the blood flowed copiously: after I had abstracted as much as I had judged proper, and the pressure was removed from the lower part of the vein, I had the greatest possible difficulty in stopping the bleeding, for it was forced out in jets, several feet distant from the animal, and she died in less than five minutes.

I am sorry that I had not the opportunity of minutely examining her, as I am persuaded that it was a case accompanied by indigestion, but the heart was saved for me. It was very large, and the whole of the outer walls presented the appearance of a honeycomb; the holes were more than an inch deep; such a case of chronic disease of that viscus as I have never seen any thing else at all to compare with: and yet this cow was in as good condition as you could possibly desire to see a store beast; and, they informed me, had milked extremely well, and had shown no symptoms of illness that they could perceive, until a short time previously to my being sent for.

The little necessity for exertion that there is at times in these cases, adds materially to the power of the digestive organs, as antagonists to disease; and it is truly astonishing how the purposes of life are carried on under such circumstances as these in consideration: and yet, let the digestive organs themselves be once sensibly diseased whilst such affections exist in other parts, and it is then equally astonishing with what a rapid flow the two conjointly hurry life to its last ebb. The impression on my mind at the time this case occurred was, that the functions of the heart, which had gradually been accommodating themselves to the alteration in its structure, had not been able to stand against the rapid derangement such a case of acute indigestion had produced, and that death was the consequence.

## DEVON AGRICULTURAL SOCIETY.

The seventh exhibition for the Premiums given by this Society, took place on Tuesday, May 19, in the Castle Yard, Exeter. The exhibition being confined to Horses, Sheep, and Pigs, was not large, but generally, and particularly of Sheep, of an exceedingly fine description.

*Horses.*—The Horses were—a light bay, a fine colt, not two years old until the 16th of June next, got by Mr. Tremlett's horse, of Crediton, and the property of Mr. John Dymond, of Alphington. "Young Nimrod," also a light bay, sixteen hands one and a half inches in height, six years old, got by "Bristol Brutus," the property of Mr. George Radmore, Easton Farm, Thorverton. A grey speckled cart stallion, a most splendid horse, five years old, got by "Farmer's Darling," the property of Mr. Henry Ellis, of Sampford Peverel. A cart stallion, seven years old, a fine animal, the property of Mr. John Gregory, of Crediton; and the celebrated cart stallion, the property of Mr. A. Ware, of Broadcliff. The Society's horse, "Elephant," was also shown in the Castle Yard.

*Mares and Foal.*—These consisted of a mare and foal, the property of Mr. Norris of Broadcliff; sire, Tinker, Mr. Ware's horse, of Westwood, in the same parish; a mare and foal, the property of Mr. Richard Salter, Westcott, in Cullompton—sire, Tinker; a hackney mare and foal, the property of Mr. James Tremlett, Cadbury—sire, the Society's horse Elephant; a hackney mare and foal, property of John Adney, Esq., Lympstone—sire, Elephant; a hackney mare and foal, property of Mr. Edward Trood, Exminster—sire, Elephant; a hackney mare and foal, property of Mr. William Trot, Honiton's Clyst—sire, Elephant. There was also in this part of the yard, a thorough bred mare, which is to be offered for sale on Friday next, at the Bazaar.

*The Kewewich Premium.*—This is a premium of a piece of Plate, valued 5*l.*, offered by Samuel Trehawke Kewewich, Esq., of Peamore, in this county, for the best colt or filly, of any age, by the Society's horse, Elephant; and the animals competing for it became a great point of attraction. These consisted of—a dark bay horse, a beautiful colt, two years old, the property of Sir Humphry Davie; a light bay, also an exceedingly fine colt, two years old, the property of Mr. Christopher Flood, jun., Honiton; a dark bay, out of the same mare as the former, twelve months old, the property of Sir Humphry Davie, admired by every one; a light bay, twelve months, property of John H. Ley, Esq., Trehill; a bay, out of a grey mare, twelve months, property of Lord Rolle; a dark colt, two years old; and ditto, one year, property of H. F. Bidgood, Esq., Rockbeare. These colts have not had a mouthful of dry food, and therefore were among the best evidence of the excellence of their stock. The next drew general attention; indeed, was the pet of the morning—it was a dark two-year old racer, out of Miss Bags, thorough bred; a perfect and most beautiful animal; the property of the Hon. Newton Fellowes. To this succeeded a dark bay two-year old, property of Mr. William Land, St. Sidwell, Exeter; a two-year old bay, property of William Courtenay, Esq.; cart mare and foal, property of Mr. Randle, Kenton; and a light bay, coming two years, property of the Rev. George Ceely Prior, Ploughhill. Indeed, the whole exhibition for the Kewewich premium must have been highly encouraging to the patrons of the society, and particularly to those

who were so actively instrumental in getting the horse Elephant here.

*Sheep.*—On the display here our farmers are indeed entitled to pride themselves, to speak of it as a whole, if it was not the most numerous that might have been seen, it was one that no Devonshire man need to have felt fear, much less shame, in competing with it, with all England.

*Old Rams.*—These were most remarkable animals, nor must any of our agricultural friends feel offended if, in the enumeration of those whose property they are, names of owners should be omitted. As we gathered our information, they were from the celebrated flocks of Mr. Thomas Reynolds, sen., Thorverton; Mr. John Wippell, Exminster; Mr. Samuel Drew, Exminster; Mr. James Thomas, Thorverton; Mr. Samuel Kingdon, Lynch Farm, Thorverton, and others. One of those, however, the property of Mr. John Wippell, cannot pass without particular mention, its living weight being 420 lbs.

*Hog Rams.*—The show here was of a precisely similar character we have just stated, six of them being from the fine flock of that excellent judge, Mr. Thomas Reynolds, jun., Crediton; four of them from that of Mr. John Wippell: four, also, from the flock of Mr. William Reynolds, Thorverton; three, Mr. George Gater, Cadbury; two, Mr. Samuel Drew; two, Mr. Philip Francis, Crediton; two, Mr. Thomas Reynolds, sen.; two, Mr. George Radmore, Thorverton; two, Mr. John Bodley, Stockleigh Pomeroy; two, Mr. John Upham, Sandford; one, Mr. James Turner, Colebrook, &c., &c., &c.

*Ewes and Lambs.*—These were shown in half-scores, in their wool, and were couples such will be very rarely seen again: two of the pens were the property of Mr. Thomas Reynold, jun., and one of them (No. 9) were all double couples: Nos. 1, 2, and 3, were the property of Mr. Samuel Drew; No. 4, of Mr. Philip Francis; No. 5, of Mr. John Wippell.

*Ewe Hogs.*—These were also in their wool, but it was a condition that they should have been shorn as lambs; and, as all the rest of the sheep, they were in a great state of perfection. The pen, No. 1, was the property of Mr. Philip Francis; No. 2, Mr. Samuel Kingdon; No. 3, Mr. John Wippell.

*Pigs.*—These were placed on the left as you entered, at the upper part of the yard. The boars were fine animals, among which were noticed those from the farms of Mr. John Beare, Kenton; Mr. Thomas Beedell, Upton Pyne; Mr. George Tancock, Newton, St. Cyres; Mr. Thomas Payne, Bradninch, John Adney, Esq., Lympstone; Mr. George Radmore, Thorverton; H. F. Bidgood, Esq., Rockbeare; Mr. John Thomas, Roseash, &c., &c.

*Sows.*—Here were several families; and a sow, the property of Mr. Wm. Cleeve, Haven Banks, attracted much notice—it is twelve months old, direct from the stock of Lord Western, and of the improved Neapolitan breed. Others, also, of which mention should be made, were the property of Mr. Philip Francis; Mr. John Beare; Mr. John Moon, Lapford; Mr. John Wippell, Charles Gifford, Esq., Exmouth; John Adney, Esq.; — Bailey, Esq., Comb Satchfield; Mr. Wm. French, Exwick; Mr. Wm. Martin, Bradninch, &c., &c.

The Judges were, for *Horses*,—Mr. Josias Rogers, Exeter; Mr. Robert Rookes, Topsham Road; Mr. Thomas Selwood, Membury.

*For Sheep.*—Mr. Edward Trood, Exmister; Mr. James Hellings, Holcombe Rogus; Mr. John Wills, South Petherwin, Launceston.

*For Pigs.*—Mr. John Drew, St. Thomas, Exeter; Mr. James Quartley, Molland; Mr. Charles Sanders, Honiton.

*For the Sheep Shearing.*—Mr. John Pyle, Tallaton; Mr. John Beare, Kenton; Mr. Thomas Yelverton, Ven Ottery.

*For Agricultural Implements.*—Capt. Thomas L. Lewis, R.E., Exeter; H. F. Bidgood, Esq., Rockbeare.

The exhibition was opened to the public at eleven o'clock, and closed at three in the afternoon, when the subscribers, friends, and visitors, repaired to the

### DINNER,

Which took place in the large room at Cockram's New London Inn, where Lewis William Buck, Esq., presided, supported on his right by Major Fulford, and on his left by John Stevenson, Esq., of Alphonington. At the table, on the left of the Chairman, sat Samuel Trehawke Kekewich, Esq., supported on his right by Captain Thomas Locker Lewis, R.E., and on his left by Edward Woolmer, Esq. At the table, on the right of the Chairman, sat John Henry Ley, jun., Esq., supported by James Samuel Pitman, Esq. The Vice-President was Abraham Smith, jun., Esq., Tralesbeare; and about 147 sat down to a well served dinner.

The cloth having been removed, *Non Nobis Domine* was sung by Messrs. Risdon, Wood, Ware, and Burch, who also, in the course of the afternoon, sang several glees.

The CHAIRMAN, as the first toast, would give them one which, by Englishmen, would always be drank with pleasure. (*Hear.*) He would give them "The King,"—drank with three times three.

The CHAIRMAN next gave "The Queen and Royal Family," which was similarly honoured.

Mr. BUCK now rose, and said, "Gentlemen, it falls on me now to propose the health of a noble person, which I am sure will meet the cordial concurrence of every one present,—I mean, as you no doubt have anticipated me, the health of the Noble and excellent President of the Society, Earl Fortescue." This was drank with three times three cheers, and one cheer more.

Mr. BUCK now rose and said, "Mr. Vice-President and Gentlemen, I rise now to propose a toast very nearly connected with the cause of our present meeting: it is that of Prosperity to the Devon Agricultural Society. (*Cheers.*) And in doing this, I have to ask for your indulgence in not having more early, in the way that I have always felt that I ought, attended to its concerns. This has not arisen from a want of good feeling towards, or a want of a high opinion of the purposes this and similar societies are calculated to fulfil, but from accidental circumstances that, at the time of your exhibitions, has found me far hence, and put it out of my power to attend. Though, from this cause, but too frequently absent, however, yet do I trust to have credit with this company when I say, there is not an individual in this room who feels more deeply interested in, or more desires the success of this Society than myself, and if its views were even more extended than they are, the members would find me ready to accompany them in such extension. (*Hear, hear.*) Gentlemen, when I look around, and find that land-owners and agriculturists are the only capitalists in the country that, for their common good, are not united, I cannot but entertain feelings bordering very nearly, if not

quite, approaching to astonishment. (*Hear, hear.*) I do see certainly that a proper feeling of what is due to themselves, and the capital they have embarked in the several lines into which they have entered, is sufficient to unite the merchant and the manufacturer in one common bond of interest, nor can I conceive why it is that agriculturists have been so slow in following the example. (*Hear.*) I do conceive that it is a duty they owe to themselves to unite themselves together for one common interest. (*Hear.*) I have no wish to go farther into this subject at present; indeed, what I have said, I mean rather as hints, which I throw out in the hope that they may make an impression upon others, and that in the end, the agricultural interest may reap all those advantages which would be likely to arise to them from a unity of purpose and of action which is unknown to that interest at present. (*Cries of "Hear."*) To quit this subject, however, permit me to congratulate you on the splendid exhibition we have seen to-day, nor, in doing this, can I, nor ought I, to be ungrateful of the past services of those individuals with whom I may with much truth say, this Society emanated. (*Cheers.*) The patriotic object of these persons was not only that by means like these agriculture should be benefited, but the industrious classes also. (*Great cheering.*) Purposes like these, however, can only be effected, and the ends of such societies as that of which we are members, answered, by the cordial co-operation of that enlightened class of men, the practical yeomen. (*Hear, hear.*) I do hope, then, whilst we have so much to thank them for, that they will be stimulated to still further exertion, for I hesitate not to say, that on this class of persons the well-being, or otherwise, of this Society rests. (*Hear, hear.*) It has, gentlemen, been to me, desiring, as I do, the success of this and all similar societies, a source of the most heartfelt pleasure, that already, at our exhibitions, has the competition been so great, and the merit so deserving, that the Judges have great difficulty in deciding as to which the prizes should be given, and sensibly feel and regret that much that has the most decided merit must of necessity be turned away. (*"Hear, and great cheering."*) With evidence, then, before me what the Society has done; with a perfect conviction of what, if properly conducted, it is capable of doing, I have the greatest pleasure in proposing, and from the bottom of my heart, with you to drink, in a bumper, and with three times three, Prosperity to the Devon Agricultural Society.

Mr. BUCK rose, and said, that with permission of the meeting, he would propose the healths of the gentlemen who had undertaken the office of Judges that day.

Mr. EDWARD TROOD returned thanks.

Mr. BUCK proposed the health of Mr. Kekewich and the thanks of the Society to him for his liberal donation, which had been the cause of adding so much to the exhibition that day, and the means also of obtaining the best evidence that the exertions of the Society to improve the breed of horses in this county had not been without success. (*Tremendous cheering.*) This toast was drank and cheered in the most enthusiastic manner, and silence being at length restored,

Mr. KEKEWICH rose and addressed himself to the President and Gentlemen. He could assure them that if at any time the cordial reception of a toast such as this could have afforded him high gratification, and he was not so insensible as to affect to say it would not, it was now heightened in a very great degree, by having spontaneously

proceeded from a gentleman in his own immediate neighbourhood; one who had the best means of knowing him well—one who had the means of knowing the estimation in which he was held in his district;—and had been as it were seconded by an old and valued friend, who had an opportunity of knowing and judging of him in other situations. He did then receive this compliment as one of the most gratifying favours that could have been bestowed upon him. (*Hear, hear.*) He trusted they did not conceive that he attributed this to the circumstance of having placed a paltry premium at the disposal of the society for the colts of the horse Elephant. No, he was willing to attribute, and receive it as proceeding from a source far more gratifying to him than this: he was willing to receive it as a proof of good feeling entertained towards him by his neighbours and friends, among whom it was one of the greatest objects of his ambition ever in amity and friendship to live. (*Tremendous cheering.*) His desire, however, he would add, to place this premium at the disposal of the society, had not been so much to bring together a large number of horses, in order that the judges might have to determine which was entitled to the prize, as to show the great zeal he had for the success of the society, and his desire that its course might be prospering, as also that as it went on, he might in all usefulness increase. (*Great cheering.*) He had early desired to lend his support to agriculture through this society, and trusted that as long as he lived he should never witness any thing but prosperity attending it. (*Cheers.*) He had been asked many times whether he thought the society had answered the ends he and others anticipated in the formation of it, but his answer had been that societies like this were not to be judged of hastily; they were of slow growth, and must not be looked at as to their results year by year, but by taking a retrospective view of the whole of their proceedings and looking back through a series of years, when, though they had worked silently, yet would it be more clearly and convincingly seen of what great importance they were and what good they had done, and looking at this society in this fair way, he would ask any unprejudiced person, or any one who would make use of the powers of his mind, if this society could by any means in the first year of its formation have had such an exhibition as they had witnessed that day. (*Great cheering.*) If it could not then, and he was sure that would be the honest answer, then had the society not been without its use. (*Cheers.*) But there was still another advantage that would be likely, and, indeed, he hoped had arisen from it, and that was that it would draw still closer the bond which it was most desirable should, and he hoped ever would exist between the landlord and tenant, and between the tenant and labourer who tilled the soil. (*Great cheering.*) He hoped he should never see the time when this great bond of union would be dissolved, as then, indeed, he should have fears which he never had yet, for his country. (*Hear, hear.*) Perhaps they would allow him then, having thus spoken of its uses, to say a few words also on the future prospects of the society. (*Hear, hear.*) All societies of this description must exist by competition, and he was perfectly aware that even in high and honourable minds, after great exertions had been made to secure a successful result, circumstances might arise occasioning a sense of soreness, and giving birth to an unpleasant feeling, but he would warn all to be most careful not to allow this to lead them into any thing like jealousy;

—(*cries of hear*)—all could not be best,—somebody must win, and somebody be the loser, but he believed he could say, that from the first, the Judges had been selected with the greatest care, and he believed also that the judgments they had passed, had been always fair and honourable. (*Cheers.*) After warning them against party and politics, he said, as to the future prospects of the society then, he would say, that he for one would stand by it. (*Cheers.*) He was not one of those who would put his hand to the plough and look back. (*Cheers.*) He had lent his fostering hand to the society in its infancy; he had already seen it in its state of manhood, and if he should live to see in it signs of decrepitude and old age, he would double and would quadruple that support in order to sustain it;—(*tremendous cheering.*)—and he would do this because he wished to see his native county as celebrated for all its products, as it was for the fertility of its soil; for the beauty of its scenery; and for the independence of its yeomanry. (*Hear, hear.*) He would do this because he believed that by societies like this our national industry would receive new directions and go on in the way of improvement; he would do this because he believed that by societies like this our national wealth would be increased. (*Great cheering.*) For the kindness then expressed towards him he begged most sincerely to thank them, and before he sat down would use the privilege which it had been just suggested belonged to him, of proposing a toast. (*Hear.*) He would give them then the health of their honourable Chairman and his worthy friend Mr. Buck, nine times nine hearty cheers followed the drinking of this toast, and silence at length succeeding

Mr. BUCK rose and addressed himself to the Vice President and Gentlemen. He returned them thanks for the honour they had conferred upon him; desiring them to believe it was at all times most gratifying to him to have his name identified with the agricultural interest; and this not from selfish views, but believing it was on the well being of that interest that the prosperity of society depends. (*Great cheering.*) He congratulated them on the display of farming stock they had seen in the Castle Yard that day, and gave the most perfect credence to what Mr. Trood had said, that the merit of all was so great, that the judges had had no little difficulty in coming to a conclusion upon it. (*Hear, hear.*) Any encomiums of his would fall far short of what the farmers in this district deserved for what he had seen that day, and it had been most gratifying to him to witness the proofs of such perfection, not only as showing the progress that agricultural knowledge was making in this country, but as displaying a spirit of perseverance under circumstances of depression such as was almost sufficient to turn the most resolute from their purpose. (*Loud cries of hear.*) He hoped, however, that they might look to better times, and should ever feel most happy if any exertions of his could conduce to the support of agriculture, or to the furtherance of the purposes of that society. (*Great cheering.*)

#### PRIZES FOR HORSES.

Mr. ROBERT DYMOND, the secretary, now read the prizes for horses, as follows:—

- Best Cart Stallion, 10l, to lot 2, the property of Mr. John Gregory, of Crediton.
- Second best ditto, 5l, to lot 1, the property of Mr. A. Ware, Broadclist.
- Best Brood Cart Mare and Foal, 5l, to lot 3, the property of Mr. Randle, of Kenton.

The Premium for the best Brood Hackney Mare, capable of carrying 14 stone, and Foal, was not awarded, being considered incapable of carrying the weight.

The best Colt or Filly of any age, by the Society's Horse, Elephant, a Piece of Plate value 5*l*, (the Premium offered by S. T. Kekewich, Esq.,) to lot 4, two-years-old, the property of Sir H. P. Davie, Bart, of Creedy.

The CHAIRMAN gave the successful candidates for horses, with three-times-three, which was drunk and complied with accordingly.

Mr. KEKEWICH desired to express the pleasure he felt at the small premium he had placed at their disposal having been adjudged to Sir Humphrey Davie, one of the best friends and one of the earliest supporters of the society (*cheers*), but whom he regretted to inform them was at that time lying on a bed of sickness, and which alone kept him from being there. (*Cries of "hear."*) He trusted that what had that day occurred would tend to cheer the hon. baronet, and that he would yet be spared many years to lend his support to agriculture, and assist the objects and aid the purposes of that society. (*Cheers.*)

Mr. BUCK would next give them "The Fleece," and would take leave to couple with it the name of an excellent farmer, and a most worthy man, who was associated in his mind with the improvement of the breed of sheep, from his earliest recollections. (*Hear, hear.*) They must have already anticipated that he spoke of Mr. Reynolds. (*Cheers.*) He would accordingly give them "The Fleece," and the health of Mr. Thomas Reynolds, as the father of the fleece in this county.

Mr. REYNOLDS briefly returned thanks.

#### PRIZES FOR SHEEP.

Mr. DYMOND now read the prizes for sheep, as follows:—

Best Old Ram, 7*l*, to lot 9, the property of Mr. Thomas Reynolds.

Second best ditto, 5*l*, to lot 6, the property of Mr. John Wippell.

Third best ditto, 3*l*, to lot 1, the property of Mr. Samuel Kingdon.

Best Hog Ram, 7*l*, to lot 2, the property of Mr. P. Francis, Crediton.

Second best ditto, 5*l*, to lot 27, the property of Mr. J. Bodley, Stockleigh.

Third best ditto, 3*l*, to lot 23, the property of Mr. John Upham, Sandford.

Best Pen of not less than 10 Ewes and Lambs, in their wool, 4*l*, to lot 4, the property of Mr. Philip Francis, Crediton.

Second best ditto, ditto, 3*l*, to lot 1, the property of Mr. Samuel Drew, Exminster.

Third best ditto, ditto, 2*l*, to lot 5, the property of Mr. John Wippell, Exminster.

Best Pen of 10 Ewe Hogs in their wool, but to have been shorn as lambs, 4*l*, to lot 1, the property of Mr. Philip Francis, Crediton.

Second best ditto, ditto, 3*l*, to lot 3, the property of Mr. John Wippell, Exminster.

Third best ditto, ditto, 2*l*, to lot 2, the property of Mr. Samuel Kingdon, Thorverton.

The CHAIRMAN gave the healths of the successful candidates for sheep, which was drunk with three times-three.

Mr. PHILIP FRANCIS returned thanks.

The CHAIRMAN next appropriately introduced and gave "Liberal Landlords and good Tenants;" drank amidst loud cheering.

#### PRIZES FOR PIGS.

These were now read by Mr. DYMOND, as under:

Best Boar, 3*l*, to No. 7, the property of Mr. Geo. Radmore, Thorverton.

[This pig was purchased by Mr. Robert Spark, of Martin's-lane, in this city; it is of the Essex breed, and, on account of the primeness of the stock, will be kept by Mr. Spark, at Alphinton, near this city. Second best Boar, 2*l* to No. 10, the property of Mr. John Thomas, Rose Ash.

Third best ditto, 1*l*, to No. 5, the property of Mr. Thomas Payne, Bradninch.

Best Sow, 3*l*, to No. 14, the property of Mr. Wm. Cleeve, Haven Banks.

Second best ditto, 2*l*, to No. 5, the property of Mr. John Wippell, Exminster.

Third best ditto, 1*l*, to No. 4, the property of Mr. John Moor, Lapford.

The CHAIRMAN gave the successful candidates for pigs.

Mr. WM. CLEEVE returned thanks.

MAJOR FULFORD spoke of the very great merit there had been in the whole of the stock shown that day, and the difficulties which had consequently stood in the way of the judges in making their adjudication. Where every thing then called for praise, although all could not be successful, he hoped they would join with him in a toast the chairman had permitted him to give, of the healths of the unsuccessful candidates.

Mr. JAMES HELLINGS desired to bear testimony to the great merit of the sheep which had been produced, and the difficulty the judges had had in deciding upon them.

Mr. JOHN BEARE, (Kenton,) as an unsuccessful candidate, observed that he thought he did not stand in that situation because the society was falling to the ground, but because it was rising in eminence. (*Hear, hear.*) The depressed state of agriculture had been alluded to by the chairman, and it was but too well known to them all that it was a great interest that was indeed depressed. There were great evils existing, and no time could be more proper for making these known than in the presence of their landlords, met too on an occasion for which a business of that kind seemed most fit. (*Cries of "hear."*) He would say at once then, that the three great evils that now so severely pressed upon agriculture, were RENT, TITHES, and THE MAINTENANCE OF THE POOR. (*Loud cries of "hear."*) He hoped then that every landlord present would be inclined to go heart and hand with their tenantry in effecting an immediate abatement in rent. (*Hear, hear.*) He hoped that every clergyman, in times when five shillings and sixpence a bushel was the utmost that could be obtained for the best wheat, would also be ready to come forward, and say he was prepared to meet the nature of the times and the altered state of things, by making a very large reduction in the amount which he had hitherto been demanding for tithes. (*Great cheering.*) He hoped also that the new legislative enactment relative to the poor, would be so put into operation as to relieve the farmer from a great portion of the burden under that head, which had so long and so grievously pressed upon him,—so that the farmer, as in fairness he ought, might by industry and economy be enabled to live. (*Great cheering.*)

The CHAIRMAN gave "Success to Agriculture, Manufactures, and Commerce;" drank with three times-three.—And next, "The Ladies of the

County of Devon," which was drank with nine-times-nine, and "once more for the ladies."

#### PRIZES FOR SHEEP-SHEARERS.

Mr. DYMOND now read the prizes for sheep-shearers, as follows:—

Best Sheep Shearer, 2*l*, to John Palmer, shearer to Mr. John Bodley.

Second best ditto, 1*l*, to G. Elworthy, shearer to Mr. George Gater.

Third best ditto, 10*s*, to Robert Gillard, shearer to Mr. John Wippell.

Fourth best ditto, 5*s*, to William Wills, servant to Mr. Richard Brown, Duncombe, Crediton, and shearer to Mr. Philip Francis.

The Judges also recommended J. Jackson to the notice of the meeting, who is excluded from a prize by his having won the first premium at a former meeting.

Mr. Dymond having concluded,

The CHAIRMAN gave, "An Honest Peasantry;" drank with three-times-three.

Mr. KEKEWICH trusted they would bear with him a few moments while he proposed the health of their excellent Secretary. (*Cheers.*) His services had been of an exceedingly valuable description, and having himself attended all the early meetings of the society, he would say, that he scarcely knew how they could have progressed without the help of Mr. Dymond. He had therefore great pleasure in proposing the health of that gentleman, which he was sure towards one who had served them so faithfully and so zealously they would honour with three-times-three.

Mr. ROBERT DYMOND rose and said he was not in the habit of making speeches, which was perhaps rather a singularity in the present day, when the ambition of so many appeared to be that of being considered speech-makers. (*Laughter.*) He however desired them to believe he had a proper sense of, and to thank them for the compliment they had paid him; as also that he was gratified thus to learn that his services were deemed to have been useful to the society. While thus addressing them, also, he would take an opportunity to mention a circumstance which had occurred connected with his office. (*Hear.*) There had been dropped that day in the Castle yard a sum of money, (*hear, hear,*) he did not know whether it was the intention of the person who had dropped it to leave the amount for the benefit of the society, which was in want of assistance of that kind, and he, therefore, now mentioned the matter, in order, if that was the case, that the design of the donor might be communicated to him afterwards. (*Loud laughter.*)

#### PRIZES FOR AGRICULTURAL IMPLEMENTS.

Mr. DYMOND now read the prizes for agricultural implements, as follows:—

"The Judges of agricultural implements beg to report that they have inspected the specimens sent, and recommend that the sum of 20*s* be given to William Hogg, of Upton Pyne, for his Turnip Drill; 15*s* to Wm. Ellis, of Cadbury, for his Scuffle; and 10*s* to Samuel Williams, of Shobrook, for his Scuffle; and 10*s* to Samuel Pyle, for his Plough Share.

(Signed) "Thos. Locke Lewis.

"H. F. Bidgood.

The CHAIRMAN gave the healths of the Vice-Presidents, Mr. Smith, Mr. Kekewich, and Mr. Ley,—drank with three-times-three, and Mr.

SMITH and Mr. LEY acknowledged the compliment.

The CHAIRMAN then in a very happy manner alluded to the connection which had many years existed between himself and the city of Exeter, and spoke of the good wishes he should ever entertain towards it, concluding by giving Prosperity to the city of Exeter, and many thanks to those of its inhabitants who have advanced the interests of this society; which was drank with nine-times-nine and one cheer more.

Mr. W. H. LANGWORTHY, on the part of the inhabitants, returned thanks.

The CHAIRMAN next proposed the health of Mr. Fulford, which was received with great enthusiasm and drank with three-times-three.

Mr. FULFORD returned thanks.

The CHAIRMAN gave the gentlemen of other counties, who had that day honoured the meeting with their presence. Which was drank with three-times-three.

Mr. KEKEWICH, as being connected with Cornwall and Somerset, as well as Devon, spoke of the advantages likely to arise to agriculture, from this increase of intercourse between the persons connected with it in the three counties; and alluded to the establishment of agricultural societies in them, mentioning particularly East Cornwall, set on foot at Callington; as also another which had existed some time at Launceston; and Mr. Buck added that of Stratton.

Mr. WILLS, as a member of the Callington and Launceston societies, also gave an account of the progress, and again eulogised the exhibition he had seen that day.

The CHAIRMAN gave "The Committee of Management, with thanks to them for their services;" drank with three-times-three.—The toast was acknowledged by Mr. John Drew and John Yarde, Esq.

Mr. JOHN UNDERHAY, Heavitree, desired to give the health of Sir Thomas Acland, which proposition was received with the most electrifying cheers, and also drank amidst continued cheering.

Mr. THOMAS HUSSEY desired to give the health of one of the firmest supporters of the society, and one of the best landlords in the county, who had been prevented being present with them that day, Sir Lawrence Palk. (*Great cheering.*) This toast was drank, and followed by nine-times-nine hearty cheers.

The CHAIRMAN said, time was wearing, and he would therefore give them "Our next merry meeting." Which having been drank, and followed by cheering, Mr. Buck and many gentlemen, at half-past seven o'clock, rose, and amidst loud applause, quitted the room.

JOHN HENRY LEY, jun. Esq., was then called to the chair.

#### BRISTOL AGRICULTURAL SOCIETY.

The annual exhibition of sheep shearing, under the patronage of this society, took place on Tuesday, June 2nd, at the New Cattle Market, Temple-street. The company, which were select, but not numerous, were highly pleased with the performance of the different shearers. The following prizes were awarded:

FIRST PRIZE.—*Society's Coat and Buttons.*—Henry Prosser.

SECOND PRIZE.—*One Pound.*—Charles Gould.

THIRD PRIZE.—*Ten Shillings.*—John Churley.

The following bounties were also given :

*Ten Shillings.*—William Towals.

*Seven Shillings and Sixpence.*—Samuel Ford.

*Seven Shillings.*—Joseph Porter.

*Six Shillings and Sixpence.*—John Stidfall.

*Six Shillings.*—Charles Ball.

*Two Shillings.*—Jonah Caple, Joseph Parsley, James Edbrook, Joseph Kingston, James Scriven, Thomas Stidfall, Daniel Stidfall, Joseph Jordan, John Young, and Charles Thatcher.

### JUNGLE FOWL.

The bird known by this name among the English in India, is the " Wild Cock " of Sonnerat, who was the first to describe it in his ' Voyage aux Indes Orientales.' This naturalist maintained with considerable zeal that this bird formed the stock whence most of our races of domestic fowl have proceeded. He concurred in the opinion of Buffon, that most of our varieties of domestic fowl have proceeded from a single type, and that the differences which we perceive among them have resulted from accidents of climate, domestication, and crossings of varieties. Sonnerat, who did not or would not know of any other species of wild cock than this—for he speaks slightly of the authority of Dampier, who mentions that he saw wild cocks in the Indian Archipelago—naturally enough concluded that in this jungle-fowl he had found the primitive stock. Subsequent inquiries have, however, confirmed the statements of Dampier, not only as to the existence of species of wild fowl in the Indian Archipelago; but it is also admitted that the *Bankiva* species in Java, and the *Jago* species in Sumatra, more nearly approximate to our common fowl than that now under consideration, and to which Sonnerat's statements refer. Upon the whole, it seems that our varieties of domestic fowl proceed from mixtures of original species. Practical observers arrive at much the same conclusions on this point with scientific naturalists. It is thus, for instance, considered in India that our game cock originated from a mixture of the jungle cock with wild species in Malaya and Chittagong. Altogether, however, it must be admitted that, on this disputed point, very little is actually known; and the domestication of the bird ascends to such remote antiquity, that it seems hopeless to determine the era, and still more hopeless to ascertain the original species with precision. It is proper to add that the jungle fowl, which we now proceed to describe, are quite distinct in India from the domestic races reared by the natives, which do not in any respect differ from the domesticated varieties in all parts of the world.

The jungle cock is about one-third less in bulk than our common village cock. Its length from the point of the bill to the extremity of the lowered and extended tail, is about two feet four inches; and its height from the level of the feet to the top of the head, without including the crest, is fourteen inches and a half.

The head is furnished with an indented comb, and the wattles resemble those of the domestic cock, but the naked space around the eyes and on the throat is larger than in that bird. The feathers of the head and neck grow longer as they approach the body; and in their form and substance are different from those which cover the same parts in other cocks, whether wild or domestic. The quill is thick and flattened, forming a white stripe; the whole length of the feather, as far as the extremity where it ends in a dilated cartilaginous substance, is of a rounded form, thin,

highly polished, and white. The feathers of the back and those of the tail coverts, are long and narrow, and are of a dusky brown colour, varied with spots of a brighter hue, the whole having a white stripe down their shafts. The breast, the belly, the sides, the thighs, and the abdomen are dusky, tinged with green. The greater quill feathers are dull black, and the middle and secondaries are black, with green reflections. The lesser and middle wing-coverts have the shafts of their feathers flattened, and their tips furnished with a thick and solid cartilaginous plate, of the same general appearance with those on the neck, but of a deep red colour. The colour of the tail-coverts is deep violet; they are lengthened out and arched over the two vertical planes of the tail, which is composed of fourteen feathers, separated into two portions inclined towards each other, and forming an acute angle. The two middle feathers are longer than the others, and form an arc, the convexity of which is turned from the body of the bird. The feathers of the tail are of a black hue, with green reflections. The feet are of a grey colour; the beak horn-coloured; the fleshy appendices of the head are red, more or less deep.

The female of this species is much less than the male and has scarcely any comb or wattles. The throat is covered with feathers, and this forms a remarkable distinction from the domestic hen, which has that part nearly naked. The circumference around the eye is naked and reddish. The whole of the plumage of the lower parts of the body resembles that of the male, except that the colours are less brilliant. The feathers of the neck are but slightly lengthened, and, as well as those of the wings, are destitute of the singular cartilaginous tips with which those of the male are furnished. The whole of the upper part of the body is grey, more or less dusky, with the shaft of each feather white. It deserves to be remarked, that in this, as well as in the other Indian wild species, the females do not differ among themselves in the colour of their plumage, like our domestic hens. The females also of those primitive species resemble each other individually, which, as is well known, is by no means the case with our domestic hens, the differences between the individuals of which sometimes extend to characteristic attributes, such as the absence of crest, of gills, great difference of size, &c. This is a strong fact against the opinion of Buffon, who considered that a white plumage must be the attribute of the primitive race, and imagined that hens originally white, became varied from white to black, assuming all the intermediate colours in succession. But our acquaintance with wild species which were unknown in Buffon's time enables us to conceive it more probable that the primitive hens are brown, red, or grey indifferently, and that white and black colours are among the consequences of domestication, for all the wild hens which have hitherto been observed have the intermediate colours.

The cry of the jungle fowl is in some measure different from that of the domestic species; but there is much resemblance in their habits and dispositions. The following lively statement on this subject is from 'Excursions in India,' by Captain Thomas Skinner, published in 1832.

" In some parts of the forest we saw several jungle fowl; they have exactly the same habits as the domestic poultry. The cock struts at the head of his hens, and keeps a strict watch over their safety. Whenever they were disturbed by our attempts upon them, he flew to the highest branch of some tree beyond our reach,

and crowed with all his might, while his dames ran into holes and corners to escape our attacks: they are so cunning, that we found it impossible to get within shot of them with all the caution we could use. While intent upon capturing at least one, as we were creeping after them upon our breasts, lying occasionally like riflemen under cover of the unevenness of the ground to catch them *en passant*, we came suddenly upon an ambuscade that very soon put an end to our sport.

"We were about midway up the face of a hill that was thickly covered by trees, and much clogged by shrubs and creepers that wound in all directions. On reaching the foot of the enemy's position, still advancing upon our breasts, and bending a keen eye upon the birds strutting before us, up rose, with a growl that denoted an offended spirit (for we had literally touched his tail), a large black bear; and turned round, looked us in the face with the most undisguised astonishment. It was the most unsought, as well as most unpromising introduction I had ever met with. There was no time for parley, and getting upon our legs, we at once stood upon the defensive. This sudden metamorphosis completed his surprise, and, yelling louder than before, he set off as fast as he could shuffle from the extraordinary animals that had so unaccountably sprung up before him. We determined that discretion was the better part of valour, and began to retrace our steps, leaving the jungle fowl to benefit by the interruption."

The following is the process which the Shecarries—or natives of low-caste in India, who gain a livelihood by catching birds and animals—employ for the purpose of taking the jungle fowl:—"Two or three of these men go for this purpose together, and proceed in this manner. A line of thirty or forty yards long is fastened to the ground with wooden pegs at each extremity, and is then elevated by props to the height of about eighteen inches. To this prop nooses of horse-hair are fastened at distances of about two feet from each other, and when the birds attempt to pass under the line, they are caught in the nooses by their necks. Sometimes a similar line is fastened to the ground, and left lying there with all the nooses spread, and as the birds pass over them they are caught by the legs. These lines are never spread where there is much juggle. When the line or lines are ready, the men go off to a considerable distance, and beat the bushes in a direction towards them,\*"

AGRICULTURE.—The West Devon and East Cornwall Agricultural Society held their Show for Stock, on the 4th of June, at Launceston. There was a fine selection of horses, bulls, cows and heifers, sheep, and pigs, and a large number of celebrated breeders and agriculturists attended, who were highly gratified with the excellence of the various descriptions of stock. The umpires for horses and bullocks were Mr. Threhervey, Probus; Mr. Gatley, Probus; and Mr. Reynolds, Crediton.—For pigs, sheep, and sheepshearers, Mr. Hendall, Probus; Mr. Gater, Cadbury; and Mr. Quartley, Molland.—The list of premiums awarded to the successful competitors reached us too late for insertion. The arrangements were highly creditable to the able and active Secretary, Mr. W. R. Bray.

## PAROCHIAL SETTLEMENTS AN OBSTRUCTION TO POOR-LAW REFORM.

BY JOHN MEADOWS WHITE, Esq.

London: Fellowes.

This is an able pamphlet, by a gentleman peculiarly well acquainted with the subject to which it relates. He observes that—

"During the long and laborious discussions on the Poor-Law Amendment Act, the system of parochial settlements seems scarcely to have met with the consideration which its importance deserves. The Commissioners of Inquiry, it is true, in their very able Report, detailed the origin, and many of the evils produced by this system; but their inquiry was confined to its effect on the poor rate, and to suggestions for its alteration, with reference alone to the pecuniary burthens which its unequal operation imposed upon different parishes. Yet even these suggestions were not considered worthy of entire adoption. One of the worst kind of settlements, that by apprenticeship, was retained, although the House of Commons had passed a clause for its abolition, and although its evils, and the fraud to which it led, had been so strongly stated by the commissioners. Parochial settlements, however, not only form one of the greatest obstructions to poor-law reform, but are mixed up with, if they do not directly tend to, results of a still more extensive nature. Originally, birth, or dwelling for a certain period in a place, seem to have been considered the grounds for declaring a man settled there. But the 43d Elizabeth, which established a permanent fund for the relief of the poor, had the effect of conferring parochial rights of no little importance on the class for whom that fund was provided. Before that statute, the object of the legislature was to restrain paupers from begging beyond certain limits. And so early as 12 Rich. II. c. 7, (1388)—the first act cited by the Commissioners,—labourers were restrained from going beyond the hundred, rape, wapentake, city, or borough, where they were dwelling, without a testimonial of justices shewing reasonable cause for their going; and impotent persons were to remain in the towns where they were dwelling when the act was passed; or if the inhabitants were unwilling or unable to support them, to withdraw to other towns within the hundred, rape, or wapentake, or the towns where they were born, and there abide during their lives. This was in effect, a district settlement; but subsequent statutes in the reigns of Henry VII. and Henry VIII. restrained beggars to their place of birth, or where they last abode for three years.

"Originally, therefore, settlements were restrictions on the liberty of those to whom these statutes were intended to apply, and those who transgressed the limits within which they were confined, were punished like run-away slaves,—a name given them in the statute 1 E. VI. c. 3.

"After the 43d Elizabeth, with a view to check the poor from flocking to the parishes which, in compliance with the provisions of the act, provided the best stock, powers were given to justices, on the complaint of parochial officers, to remove paupers under certain circumstances, to the places where they were last legally settled as natives, householders, sojourners, apprentices, or servants, for forty days.

"This power of removal (which the Commis-

sioners observe it was the object of subsequent statutes to limit, until the 35 Geo. III. c. 101, which prevents a person being removed until actually chargeable) was evidently intended as a protection to the funds, or poor-rates of the removing parish, and the battle thus begun between parishes and paupers has continued without intermission to the present day."

After this statement of the law, Mr. White proceeds to make several remarks on its effect both on landlords and labourers, and to point out the sort of remedy afforded by the late statute:

"In the Poor-Law Amendment Act there is a power which would assist in reconciling the difficulties, and provide a remedy as far as the nature of the case will admit. This is to be found in the 33d clause, giving the power of making a district settlement. By this plan, a certain average of past expense for settled poor being ascertained and fixed, the amount is taken as the future invariable proportion of contribution of each parish to a common fund, the management of which is entrusted to guardians, chosen from the landlords and occupiers of the union. And the three following clauses carry this principle still further, by enabling such a union to have a common valuation and rate.

"This plan, as it is laid down in the Poor-Law Amendment Act, can only be adopted *voluntarily* by the parishes of any union; and it is to be hoped that its adoption is not far distant. In Bristol, under the Local Act, it is already in force as between the several parishes of the city; though as between them and foreign parishes, the distinction of separate parochial settlements is kept up."

Our business is rather to notice amendments in the law which affect the administration of justice in our superior courts, than the policy of laws in general; but the following observations of Mr. White, on the subject of making the Poor-Law burthens *national*, are worthy of the attention of those members of the profession who are engaged in advising on and conducting the legal part of parochial affairs.

"The statistics of pauperism, as affected by parochial settlements, and the unequal, and hence unjust, taxation which they impose on different parts of the country, will furnish ample support to the arguments of those, who say the state should bear this burthen. And they furnish no less strength to those who argue that the poor laws should be brought within their natural limits, and no longer be allowed to tax industry for the support of idleness; to call on the hard-working man to maintain those who do not work; or those who can find work for themselves, to impart its fruit to others who cannot find it; or those who give work to a fair number of labourers, to pay for labourers they do not want, and whom others, with occupations requiring them will not employ, except at wages paid from the parish purse. At present, a man may say, "I am willing to work; you confine me to this spot, and therefore you must find work, or maintain me and mine without it." True policy would answer,—"If you cannot find it here, go and seek it elsewhere; if this parish is too small, go to the next; search through the

kingdom; and if still work be wanting, facilities shall be given for finding it abroad." Government, to protect its subjects in the enjoyment of their earnings, must take care to secure for all the means of finding food by work, without intrenching on their neighbours; and all have a right to claim protection in seeking for these means at home, before they have recourse to another country. In the present state of the poor laws this is not done. Not only do they deny this right to the poor man, but upon those who are more favoured, or more fortunate in finding scope for industry, and in accumulating its fruits, they impose what amounts to an agrarian law; and that portion of the territory which is nearest the seat of government, is in a course of unjust division, whilst the colonies at a distance are either peopled with convicts, or lie waste for want of hands to till them. Let the poor rate be made a substitute for the private charity of those who cannot or will not give voluntary alms, but let it not remain a heavy clog on industry. And to effect this, begin, as an encouragement to industry, by giving it room for free circulation at home, and the exorcism of pauperizing honest labourers, able to work, but unable to find it; *willing to seek for it, but restricted from seeking; treated almost as criminals if they remain idle at home, and as vagabonds if they are found abroad; will cease.* \* \*

"Meanwhile, it may be suggested, whether great good would not even now be effected by an extended adoption, under the direction of the commissioners, of the system already alluded to, of parishes giving certificates, acknowledging paupers to have settlements with them. By such means, labourers would have a wider range in seeking work, and the masters a better choice of workmen. Such a course would also lay the foundation of a further extension of the system, by giving labourers a right to claim this certificate. Settlements by residence in a district for a certain number of years might then be introduced with advantage, making a distinction between those who have resided under a certificate of settlement from another parish, and those who have not; and imposing on all a condition, that no recourse should have been had to the poor rate of any parish, during the prescribed term of residence. A prohibition against granting relief, except to paupers resident in the parish or union where the rate is raised and the relief given, would also be required; and this would be an important stage in reference to the final abolition of the law of settlement. There would then remain but few steps to a county or national rate for maintaining the poor;—a plan which, under an altered management, would be free from most of the objections now raised against it.

"One of the greatest difficulties of a national rate is the improvidence caused by a public fund, to which all may have recourse, without a sufficient check on the demand for its aid. This objection is one of detail, rather than of principle. If the principle be right, there would not be much difficulty in finding out a safe mode of application.—A maximum of demand; a minimum of assessment; an obligation to relieve, so as to protect the poor applicants; a proportion to be paid by the relieving districts or parishes, so as to keep up local interest and promote economy; a discouragement to rely on the rate, but a certain claim on it in cases of destitution, free from fraud, idleness, or improvidence; are points essential to be attended to, but mere postulates in good legislation."

ON THE DANGER AND INADEQUACY  
OF THE WORKHOUSE SYSTEM.

(FROM A CORRESPONDENT.)

The main principles of the Poor Law Bill are to put an end to fraudulent applications for relief, and to make every man earn his own subsistence. These grand ends are to be effected by refusing relief (for to this it must come, or nothing is done) to the able-bodied, except by employment in a workhouse. Now it should seem that however right the principle, the *modus operandi*—the method of effecting the object—is alike dangerous and inadequate. First, for its danger: a fine, athletic young fellow, with a family of two or three children, applies for relief—or, if the instance be thought better, a single man. He is offered the workhouse. No, he says, he will try any thing else rather, for such is the universal feeling of the labourer, particularly before he has become utterly reckless through idleness and privation, and he keeps his word. He tries to get employment, fails, and turns to poaching or theft. We have seen this in more than one instance. Not long since a youth was observed on a Sunday by a gentleman in a state nearly of nakedness, in passing through his village, containing a population of twelve hundred. He asked the lad if that was his best garb. It was his only one. "Come to me to-morrow morning," said the gentleman. The lad came, and on being questioned, said "He had sought work for three weeks without obtaining a day's employment; all he had in the world was gone; the overseer refused relief, and he had lingered on in hopes till he was reduced to that miserable pass; he would do any thing rather than go into the house. The gentleman gave him some clothes and some advice, and the next week he was committed to gaol for fowl-stealing. The same person questioned a very industrious, honest, most peaceably-disposed and intelligent labourer in his own employ, as to what would be his conduct where he deprived of his place and reduced to go to the workhouse. "I would go, Sir," said the man, "and help to pull it down the moment I got there, if others would join me." And this is the feeling which must be engendered, when we know that the men are willing to work but can find no employment.

Now let us take it in another point of view. In the parish where this is written, there are upon the roads or in the gravel-pit twenty-eight able-bodied labourers during the period of winter. If these men and their families were transferred to the house, not fewer than 100 men, women, and children would have to travel to that abode of wretchedness, discontent, and *force*, (for nothing else would restrain them,) some fine morning. And when they are so placed, there are about 400 children hourly growing up to increase the redundancy, beside the continual additions from new births. Is it not obvious, if you will not enlarge the field of employment by the reclamation of lands not under cultivation, must you not enlarge the area of the workhouses in equal proportion to the increase? Can any thing be so palpable?

And what is the gain? The paupers are maintained at nearly the same expence (we think at greater) in than out of the workhouse. What matters it to the country! They add nothing to production—nothing to the fund created by labour for the support of the labourer, or so little as to be almost out of the calculation. What they do produce is generally sold at a price below the

actual cost of manufacture, and thus operates to the injury of the regular trader in the article. But the demoralizing effect is dreadful; it goes to what we have described—to drive the poor man to crime in order to avoid the house; and where he cannot evade it, to the utter extinction of hope and energy. And after all, is it right? Does it belong to the rightful power of the State to punish undeserved poverty? Let us not deceive ourselves. To take a man from his home, however homely, to pen up himself, his wife, and children, in a crowded lazaretto, consorted with the vilest in character as well as the most wretched in condition—to take from him all superintendence and direction over them, and to place them under the most absolute authority of a task-master (however mildly exercised), is a degree of punishment second only to the discipline of a prison. Is this a right inherent over mere involuntary poverty in any government? leaving out of our sight for the moment the almost certain issue of driving the man to previous crime.

What constitutes the difference between America and England? what confers so much of comfort upon the inhabitants of the former country beyond what the industrious classes enjoy in the latter! Neither more nor less than the single, simple fact, that land may be had in America for little or nothing. And has England then, no land?—is her area fully peopled? The astounding answer is, "England possesses, at this minute, fifteen millions of uncultivated but cultivable acres; millions of capital, for which it is difficult to find employment at the low rate of three per cent. per annum; a redundancy of industrious, hardy, willing, and skilful people, driven to privation and crime by want of employment, (whilst the nation bitterly complains of burdens, and the competition thus brought upon them,) together with a perfect knowledge of the fact, that wealth, individual and national, results from the combination of soil, capital, and labour.

But, say these same economists, "We must do nothing that may at any period, however remote, increase an evil. There may, nay, there must, come a time when all the land in England will be over peopled; if, by making the industrious man comfortable—if, by removing the pressure of numbers against subsistence, we diminish privation, misery, and death, the great 'preventive checks' to increasing population." Such is the nonsense of over-cautious, over-calculating science. Millions are in a state of positive wretchedness—the whole community is borne down with the burden of their maintenance and their competition—life, property, and our social existence itself, are in hourly danger; but all this must be endured, lest the State should incur the same peril some centuries hence, and that, too, under the impossible supposition that knowledge, experiment, and experience will effect nothing for the better arrangement of social relations, and the disposition of that power of production, which we already know to be more than equal to the wants and luxuries of all, by the labours of comparatively few. *O curas hominum! O quantum est in rebus inane!*

Extract of a letter received from Swan River on the subject of Australian wool, dated 27th September, 1834:—"Wool growing is now the all-absorbing subject of conversation in our colony; many settlers who had embarked their little capital, and sacrificed their time in pursuits which could yield them little or no profit, have at last found their mis-

take, and are turning their whole attention to the propagation of sheep, and production of wool. It is evident that those who have made it their study have had the advantage of the little traders, shop-keepers, and clerks under Government. I will give you one instance; at Mr. Latour's sale an industrious man purchased sixteen sheep, which he took with him over the hills, where there is excellent land; he has now one hundred and seventy. It was in the beginning of the year 1831. I can assure you hundreds of persons are leaving their concerns, such as shopkeepers and little traders, and are embarking the little they have left in the purchase of sheep; if such had been their pursuit when they first arrived in this colony, we might by this time have had an extensive export of wool, instead of at all times sending our capital home, and draining our colony of every thing that should have been left amongst us. The road is now open. We know from experience of others what can be done, and have lived long enough in the colony to be sufficiently acquainted with its capabilities; we only want more capitalists and labourers—that once accomplished we should soon bid fair to rival our neighbouring colony, notwithstanding all the prejudice we have had to encounter. Independently of that, we have had too many young men sent out by their friends, because they could do nothing with them in England; their character and habits are such they will do well no where, and certainly are the last class of men that should have been sent to this colony. The men we want are small capitalists, industrious mechanics and labourers; they will be sure to do well. The Governor, Sir James Stirling, was well received on his return, and all things are going on as well as we can expect."

### PROJECTED EXPERIMENTAL FARM.

We have just been favoured with a perusal of a statement, about to be submitted to the Highland and Agricultural Society of Scotland, "On the advantages which would result from the Establishment of an Experimental Farm."

The author, who shows that his signature of "A Scotch Farmer" is not a fictitious one, after detailing the many inconveniences and disappointments arising from the present system of individual exertion being cramped and limited, from having no standard nor repository to refer for facts—clearly shows that of one great advantage to be derived from an experimental farm, under the superintendence and fostering care of the Highland Society, would be the exemplification of many of those sound theories in agriculture which are often lost from want of perseverance and attention.

The other benefits, resulting from such an establishment, would be the improvement of the different kinds of live stock; and, although private exertion may have done much to bring to perfection the breed of cattle, yet such an establishment as the one under review would be a never-failing trust to bring to maturity such schemes as private individuals might originate. And, with regard to that branch of agriculture which comprehends the seed and roots, in general use in this country, it would be of immense advantage in assisting to fill up that deficiency in agriculture, when contrasted with horticulture. The farmer, having only three varieties of peas, whilst the gardener has from twenty to thirty; and whilst the former has only about half-a-dozen of varieties of wheat, oats and barley, the latter has at least one thousand varieties of apples and pears &c. The advancements made in horticulture being in great measure, attributable to the

experimental gardens, it is equally probable that similar advantages would accrue to agriculture from a similar establishment.

Accident may, in some cases, introduce a new seed; but this seed is often much deteriorated from not knowing what soil is most suitable to its growth. This tends to show the advantages which such a farm could afford to those using such a seed.

The farmer also experiences great difficulty in procuring pure seeds and roots; and, even should he succeed in obtaining them, they are purchased at a high rate. Both of these disadvantages would be obviated by the existence of an experimental farm; and, from the sacrifices made by farmers to obtain good seed and roots, it is presumed they would heartily co-operate with the exertions made by the superintendent of such a farm.

After suggesting a few details as regards the economy of the farm, the Scotch Farmer remarks, in order to obviate any objections that might be made as to the insufficiency of one farm, that in each county a committee might be formed who would regularly report anything worthy of remark; and thus all the different soils and climates of Scotland would be included in the farm register. And, having thus established a common point of discussion, in so far as regarded circumstances in connexion with the farm, it would greatly tend to do away with such contradictory reports as are common with those who write on rural economy, and thus, instead of vague and uncertain hypothesis, every one could find in the manager's public register a ready test as to practical results, sufficient to guide him in his pursuits and experiments.

The author has thought it proper to lay his remarks before his brother agriculturists, previous to presenting them to the Highland Society, in order that they, by exhibiting their names, may show the value and importance they attach to such a farm as is proposed—and we are confident they will gladly avail themselves of the opportunity thus afforded them.

### POOR LAWS IN IRELAND.

TO THE EDITOR OF THE SUSSEX ADVERTISER.

Sir,—It is an undoubted fact, that Mr. O'Connell possesses in a very large degree the confidence of almost the whole people of Ireland. It is therefore with no small degree of pleasure that I learn he has at length become a convert to the necessity of the introduction of Poor Laws in Ireland. Most of your readers will, doubtless, recollect the dreadful sufferings and misery which the Irish poor were more particularly subjected to in the year 1822, arising, partly from the failure of the potatoe crop, and partly from other causes, which here it is unnecessary to mention. They will also recollect that the proprietors of Irish land deemed it requisite to convene a meeting for the purpose of devising the most efficient means of relieving their starving tenantry; which meeting took place—not in Dublin, Cork, or Belfast—but at the Thatched House Tavern, in St. James's-street, London! in order to give the immaculate frequenters of certain houses in that pure neighbourhood the opportunity of attending without interruption to their regular and useful avocations. The proposition of these landowners was, that the Endowments of the Established Church in Ireland should be confiscated for the benefit of their impoverished and racked tenantry!! Of the impudence of this proposition I shall at present say nothing. The amount

actually contributed by these absentee proprietors, to alleviate in some measure the distresses of their peasantry, was trifling to a degree which, without incontrovertible evidence, could not command credit. From one district in the neighbourhood of Tralee, a body of proprietors, all absentees, drew, at that time, in income little short of £90,000 per annum; but the aggregate amount of their joint contributions towards the relief of their distressed countrymen did not, in that emergency, exceed £83. The bare recital of such a fact will go a greater way than any reasoning in proving the necessity of introducing some system of laws which may compel such a class of persons to perform duties which they have never shown the remotest disposition voluntarily to discharge.

Some years back the landowners of Ireland, to serve political and party purposes, acted upon a system of splitting their estates into fragments to be occupied by a race of pauper tenantry. The disfranchisement of the forty-shilling freeholders put an end to this political jobbing, and the landlords have ever since universally exerted themselves to clear their estates of the wretched cottiers whom they had encouraged to settle and multiply upon their property. The evils resulting from the system of clearing Irish estates of their superabundant population are so enormous and urgent, and affect England so closely, that I am greatly surprised so much listlessness and apathy should be shown by our agriculturists. Those wretched creatures, who being no longer of use to support the political influence of their landlords, to help them to get pensions or places, are told they "have no business where they are;" and they are driven from their homes and handed over to the punishment of nature—to hunger, slow-wasting disease, and death.

It should be recollected that the landowners of Ireland are, with few exceptions, absentees from the country whence their revenues are derived, which is a circumstance rendering the depopulating system much more dangerous than if it were carried on under the personal superintendence of the proprietor. But whatever moderation may be expected to mark the proceedings of a resident proprietor, similar forbearance cannot be anticipated on the part of an absentee who has no opportunity of personally witnessing the distress inflicted upon the outcast occupiers.

On these grounds it appears perfectly clear that some check ought to be imposed upon the conduct of Irish landlords while engaged in thinning the population of their estates. The principles of humanity, were there no other reasons, render it the imperative duty of parliament to throw some legislative protection around the unfortunate peasantry of Ireland. This has, however, become a branch of national policy which very deeply involves the interests and welfare of the landlords and labouring classes throughout the whole of England. The Irish peasants, dispossessed of their tenements by their unfeeling landlords, find their way into every town and hamlet of this country, where the supply of labourers, already, by far exceeds the demand for labour. This causes an excessive depreciation in the wages of the working classes, and makes a heavy addition to the burden now so heavily pressing upon those who are legally bound to contribute towards the maintenance of the poor. As a mere question of equity, therefore, between the owners of Irish estates and the proprietors of English land, this is an insufferable grievance which calls aloud for redress;—setting aside, for the moment, all considerations of humanity towards the Irish poor, forcibly expelled from their

cabins, justice towards the people of England requires that a check should be imposed upon a practice which throws upon them the support of that migrating horde, which their landlords send forth as outcasts. The amount which the maintenance of his ejected tenantry would abstract from the income of an Irish proprietor, is of little concern. It were better that ten shillings an acre should be deducted from his rent, if such a sacrifice should become necessary, than that a penny an acre should be levied for that purpose on the land of this country upon the produce of which they cannot have the slightest claim. The sums expended either upon the maintenance of the Irish poor, or in passing them to their own country, whence they speedily find their way back again, form no inconsiderable item in the aggregate amount of the English poor-rates.

I fear I must close this long letter thus abruptly, or it will soon assume a shape which will render it inadmissible to your columns. Should you, however, give this a place in your next paper, I may be induced, although incompetent (in consequence of the silence of those who are qualified) to return to the subject—(a subject which I cannot help again expressing my surprise should have been looked at with so much indifference and unconcern)—in the following week.

I am, Sir,

Your obedient servant,  
JUSTITIA.

Lewes,  
20th May, 1835.

#### CULTIVATION OF HOPS.

The following is from a Parliamentary return of the total number of acres of land in Great Britain under the cultivation of hops, in the year 1834, distinguishing the number of acres in each collection:—

| Collections.     | No. of Acres.      | Collections.     | No. of Acres.       |

Excise-Office, London, May 16, 1835. G. A. COTTRELL, First General Accountant.

TO THE FARMERS OF MIDDLESEX.

TO THE EDITOR OF "THE MARK LANE EXPRESS."

Sir,—I do not think agriculture was ever in a worse state than it is now ; prices are so low, tithes and rent so high, wages so high, and sheep and cows so low, and horses so high. I do not know what the farmer must do soon. I see no prospect of agricultural times getting any better, quite the contrary. There is a rail-road going to be made to Bristol, which will bring things from Ireland so cheap that none of the English farmers' things will be bought only at the same price, which I do not think he could sell them for unless he sold them for less than either he gave for them, and less than it has cost him to keep and feed them. When the rail-road is finished, if a chicken was killed there and put in the basket, you might have it in London almost before it got cold—and then again so cheap. I venture to say you will have eggs 3d a piece, and fowl 1s and 1s 6d each, pork 4d per lb., and everything so cheap that certainly it will be better for us, but what the farmers are to do I do not know. Something must be done for them, or they must go to the workhouse, or they must starve ; and I am

sure that many farmers would sooner starve than go to the workhouse, if it was not for their families. If it does come to that, I think many a man will die of a broken heart. It will cause many a tear to be shed. I have been thinking how to better the times with the poor farmers. I have thought that if they were to sell a great many of their cart horses, only just to keep one or two, and buy light horses instead, and have waggons made lighter, and to have a man to drive as they do coaches, &c., that to send things to London and other places it would pay better. First, small horses could not eat so much, and second save so much time. Now it could be impossible for a great many farmers to try this, but possible for some. Let one who can try it, and then write a letter to the editor of the "Mark Lane Express," (who, I doubt not will be kind enough to publish it), and tell the other farmers how it answers. I have no doubt it will answer very well. That is one thing I have thought of for the benefit of farmers. Another is for the farmers to join and not give so much wages. Bread and eggs are so cheap now that they do not want such high wages. I think if you try these two things it will benefit a great deal. I hope, Mr. Editor, you will be kind enough to

publish this letter in your next paper for the benefit of the "Middlesex Farmers."—I remain, Sir, your obedient servant,  
June, 1835.

AMICUS COLONO.

### AGRICULTURAL INTERESTS.

ON THE MEANS OF EFFECTUALLY RELIEVING THE LANDED AND FARMING INTERESTS FROM THE DISTRESSES WHICH THEY NOW EXPERIENCE, BY ISSUING EXCHEQUER BILLS, EXCLUSIVELY APPLICABLE TO THEIR RELIEF. BY THE RIGHT HON. SIR JOHN SINCLAIR, BART.

Exchequer Bills were first created in the year 1696-7, on the suggestion of Lord Halifax, then Chancellor of the Exchequer. They were issued for five and ten pounds, as a substitution for money, and they have since been found, on other occasions, a most effectual mode of restoring confidence, and relieving public distress.

A similar scarcity of public credit having taken place in 1793 (an account of which is given in the History of the Revenue, vol. ii. p. 295), Sir John Sinclair was induced to recommend the same plan to Mr. Pitt's attention. That able minister immediately saw the utility of the measure, and lost no time in carrying the plan into effect. A report in its favour was presented to the house on the 29th of April, and with such celerity was the business conducted, that an act, sanctioning the plan (33 Geo. III. c. 29), quickly passed both houses, and received the royal assent on the 8th of May following.

The success of the measure exceeded the most sanguine expectations of those who proposed and supported it. There is not, indeed, in history, an instance when such essential benefit was rendered to the commerce and manufactures of a country, in a manner so sudden and so easy in its execution, and from which indeed the public derived some pecuniary advantage, instead of its being productive of expense.

The government has at the present time nothing to do but to adopt the same measure, in order to restore at once the agricultural prosperity of the country. Let an able intelligent committee be appointed without a moment's delay, and let an act be passed for the issue of Exchequer Bills for the relief of the landed and farming interests, and consequences equally beneficial will be the result. And surely the agricultural interests are as well entitled to the attention and support of government as those of manufactures and commerce, however important they may be.

In order that some idea may be formed of the deplorable state to which the landed and farming interests are reduced at the present crisis, the following statement of the gradual depreciation in the value of wheat, from the commencement of this century to the present period, is submitted to the reader's consideration.

Annual average price of Wheat per quarter in England and Wales:—

| Years.         | Years.        | Years.        |
|----------------|---------------|---------------|
| 1800 .. 110 5  | 1812 .. 122 8 | 1824 .. 62 0  |
| 1801 .. 115 11 | 1813 .. 106 6 | 1825 .. 66 6  |
| 1802 .. 67 9   | 1814 .. 72 1  | 1826 .. 56 11 |
| 1803 .. 57 1   | 1815 .. 63 8  | 1827 .. 56 9  |
| 1804 .. 60 5   | 1816 .. 76 2  | 1828 .. 60 5  |
| 1805 .. 87 1   | 1817 .. 94 0  | 1829 .. 66 3  |
| 1806 .. 76 9   | 1818 .. 83 8  | 1830 .. 64 3  |
| 1807 .. 73 1   | 1819 .. 72 3  | 1831 .. 66 4  |
| 1808 .. 78 11  | 1820 .. 65 10 | 1832 .. 58 8  |
| 1809 .. 94 5   | 1821 .. 54 5  | 1833 .. 53 5  |
| 1810 .. 103 3  | 1822 .. 43 3  | 1834 .. 44 8  |
| 1811 .. 92 5   | 1823 .. 51 9  |               |

Since the 1st of January, 1835, the price has gradually receded from 2*l.* 1*s.* 5*d.* to 1*l.* 18*s.* 6*d.* per quarter, on an average of all England and Wales; and in the Berwick market it has been as low as 1*l.* 15*s.* 10*d.*

Is it then to be wondered at, that the farmers should be brought to ruin, when the value of their principal crop has been reduced, since the commencement of the present century, from six pounds two shillings and eight-pence, to one pound fifteen shillings and ten-pence per quarter?

It cannot be justly contended, that there is a sufficiency of circulating medium, when the most valuable article produced by the soil is so materially depreciated in its value; and the agricultural classes can never be restored to their former prosperous state, until there is a sufficient amount of capital in general circulation to revive confidence, and to give that remunerating price to the farmer, to which he is so justly entitled, by which means alone the agriculturists can possibly sustain the heavy burdens under which they are now labouring.

It is impossible to suppose that a British parliament, who voted twenty millions sterling for the relief of the planters in our West India settlements, should hesitate a moment by a similar grant, to relieve the distresses of the proprietors and farmers of Great Britain and Ireland, who have still stronger claims upon their friendly exertions, and without which their utter ruin seems to be inevitable.

### THE WANDERER'S RETURN.

BY A YORKSHIREMAN.

He came to the place from whence he sprung,

Where his childhood had been spent,

O'er many a spot he fondly hung,

With bright remembrance blent;

But where were they whom once he knew,

Playmates still unforgot?

No face familiar met his view—

He sought, but found them not.

They were gone!—Across the boundless sea

Some had dared to roam,

To seek in a stranger's country

What they could not find at home;

And others had found their lowly beds

Where we all must rest at last—

The cold earth wrapt their colder heads,

Their toil and strength were past.

Friendship extended not her hand,

And a tear-drop filled his eye,

For he stood unknown on his father's land,

All passed him coldly by.

Like a bird that finds its little nest

Destroyed, and its young ones slain,

He turned away with an aching breast

Ne'er to return again.

York, June, 1835.

The French rose-gatherer presents a refinement in floricultural instruments highly characteristic of its origin. The general form of this little engine is that of a pistol; it has a handle and trigger like it, and a cutter in the manner of the wire pliers, or flower-gatherer, disguised as a barrel. A rod, answering to the ramrod, connects the pincers with the trigger, which last, being pressed, opens the pincers, that is, charges the pistol; the operator then presents the pistol to the rose to be gathered, and so that, when the cutter operates it may separate it at the precise

point of the stalk deemed proper; things being thus adjusted, the trigger is drawn, and the deed is done. Of course this instrument, like a number of other horticultural toys manufactured by the Parisians, is chiefly *pour les dames*.—*London's Encyclopædia of Gardening*.

## ON THE USUAL MODE OF PREPARING MANURE ON FARMS.

(From the Quarterly Journal of Agriculture.)

Not any thing connected with agriculture is so material to production as the economy of manure; and in proportion to the quantity and quality of this necessary article, are the returns obtained from the land in all situations. The present system generally practised (if it can be so termed), has been much censured by scientific and practical men of experience and known abilities; and the most able chemist of our day, has gone so far as to estimate the loss of the stimulating properties in dung by the present process, at from one-half to two-thirds of what manure should possess when put into the land.

Enough is set forth in what follows to satisfy those who are not very sceptical, that the waste in the only useful properties in dung is much beyond what is stated by Sir H. Davy, who was not likely to go into extremes, nor is this called for; but I believe my ideas are borne out by the practical facts which are known to be experienced in different parts of Europe, and these are so variable and gross as not to admit of definite computation. This art is almost coeval with man—is practised in every situation—and in all countries where the inhabitants are numerous, it is not only most important but indispensably necessary for their subsistence; and yet even in Britain, so far as I know, it is the only process that is conducted in opposition to scientific principles, notwithstanding that other branches of husbandry are prosecuted, perhaps, with more skill than elsewhere in any instance. The farmer very properly regulates himself by effects, and what appears to him most beneficial in practice; but there are good grounds for believing that he is for the most part very ignorant of the principles on which he ought to proceed, and frequently attributes results to causes very different from truth. It is natural that he should be peculiarly sceptical in this instance, where no material practical good has hitherto resulted from the light of science.

In order, however, to explain the prejudices which obstruct the introduction of any thing new in husbandry, the following observations may not be inapplicable:—

There is not any profession that affords more opportunity to experiment on a limited scale, without risk of loss, than farming; and yet there is none where so much opposition is experienced to whatever deviates from ancient custom.

It was long after the days of Tull ere the drill husbandry came into general use; upwards of a century elapsed after the introduction of the potato into Britain before it was much raised even as a garden vegetable; and within the recollection of many, such were the prejudices of the Scottish peasantry, that by them every distemper that prevailed was attributed to its deleterious influence. Although cultivated as a culinary vegetable earlier than the potato, the turnip husbandry, now an indispensable part of our agricultural system, has not been long practised; in most other parts of

Europe it is little used, and in many situations unknown as a field plant. But a few years ago, old meadow was considered most valuable, and was preserved and handed down from one generation to another as an heir-loom, but this is now believed in most situations to be injudicious; and it is usual to break up and occasionally to bring such lands under a regular routine of crops. Draining must necessarily have been practised at a very early period, but the immense utility of this was not generally known; nor was it extensively adopted with effect until within the last twenty years. Twenty years ago, over a great part of this country, where streams were stagnant, or the surface of the ground was in a constantly moist state, mildew and frost exceedingly injured the quality of the grain in the month of August, and prevented it from filling or ripening; but from more perfect draining, these evils are now little experienced. From this circumstance Scottish grain is now equal in quality to that of England, although formerly very inferior. We need not, therefore, be surprised at the difficulties in the way of introducing a better system in the preparation of manure, as the waste occasioned by the escape of the stimulating gases that are in dung are not immediately perceptible, and even rain mixing with the more soluble parts of the dung and washing away a very great proportion, is not so much noticed as defective crops from neglect in the mechanical operations in tillage.

Various opinions are prevalent as to the degree to which compost should be decomposed or reduced previously to being put into the ground. Sir Humphry Davy tells us that only a slight degree of fermentation should be permitted in farm-yard dung. The farmer, however, says that this will not answer in practice, and that the straw and other fibrous substances must be reduced in a greater degree, in order to bring the whole in contact with the plant to which it is to be applied, and to induce continuous decomposition, as well as to prevent the admission of air by means of the open nature of the straw in this state; also that, decomposition must be carried to a greater extent than was contemplated by this talented chemist, in order to destroy the germs of the seeds of noxious weeds, and of insects which feed on and destroy the growing vegetables. It is admitted that these objections are in a considerable degree correct; but it does not follow that because Sir H. Davy may be in error in this particular point, his whole theory should be rejected, against the other parts of which this proves nothing; nor is it any reason why the practical farmer should run into an excess that seems to rest only on habit and conceit, and set at defiance every rule in science. It rarely happens that the man of science who defines certain chemical principles in the laboratory, carries these into operation on an extended scale, which is beyond the limits of his province, but more consistent with that of the practical man [of experience, who ought to endeavour to conform art to science, and induce them to travel in unison with each other.

The present mode of preparing manure is to take the dung and litter from the original place of deposit, and throw these promiscuously into the general mass, in the dung court, repeatedly during the day, by which a fresh stimulus is as often added to the old matter, and a constant fermentation is kept up, so as to produce chemical changes very different from what are intended, and the exhaustion of those gases which form the only valuable properties in the dung. The dung, being more pon-

derous than the straw or litter, naturally falls to the bottom; and much of the litter remains on the upper surface, where it is useful in protecting the dung from the action of the sun and wind, and preventing the feet of the cattle from poaching and raising it up to the surface. The litter is, however, in this situation injurious, by admitting air sufficient to induce fermentation; whilst the straw, instead of being an absorbent, acts as conductors by which the rain is carried to the very bottom of the whole, and, mixing with the more soluble and richer parts of the dung, much of these are carried off through the opening *at the lowest point of the court* left for the escape of the superfluous moisture.

Every reflecting and intelligent individual must admit the waste occasioned by the mixture and escape of dung with rain water; but were the farmer told that there is more virtue in what is lost in this manner than in all the straw that can be used, he would not credit the fact. The evil in this case is sufficiently apparent to induce occasional attempts to collect these washings from the dung heap, and to apply them separately to the lands; but the only means to avert and strike at the root of the evil, is to exclude air and excess moisture. At the commencement of the operations already partly explained, the dung and litter occupy a limited space in the court, are in a loose heap, and rain falling upon and freely entering into it by means of the open nature of the straw, incorporates with the better part of the dung, which oozing from the heap spreads itself over the vacant space, and extends to the extremities as the materials are opened out; this liquid is quickly brought into a state of effervescence (as may be seen by the froth on its surface,) and thus fermentation is occasioned throughout, which is further excited by a constant supply of hot dung from the cattle. Most animal and vegetable substances, vegetating or dead, are exceedingly influenced by changes in the atmosphere, from causes but imperfectly understood; the freshest straw in the dunghill indicates this by becoming yellow during frost, and that which is mixed with dung and exposed to the air, assumes the dark colour of the liquid matter which oozes from the heap, whilst the succeeding thaw, in its effects, evinces that the whole has by frost been prepared for more rapid dissolution of the most solid materials than at the same temperature previously. Thus the whole are acted upon by every degree of variation in the weather, at every stage; and can it be imagined that these changes take place without the induction of some, and the escape of other volatile principles, or is this irregularity of action consistent with any other systematic process? The farmer says that early fermentation is prevented by the stock trampling and consolidating the materials; but this is not done until enough is collected to cover the whole area of the court (nor is this regularly covered at any time,) and the combined evils pointed out, have been sufficiently long in action to induce a heterogeneous nondescript species of fermentation, which renders the mischief perpetual and irremediable. The farmer is very prudently averse to change, until it is clearly demonstrated to him that he is to derive early advantage; and on this account I shall explain certain facts consistent with his own experience, and others derived from sources easily accessible to him, and which, in my mind, are sufficient to prove immense loss by his present practice, which cannot be made worse, but a moderate change may be a means of gain, without any material outlay or al-

teration in his mechanical arrangements. When manure is prepared in the open field, where stock are penned for this purpose, why is it found to possess less vegetative powers than what is dropped in the house and mixed in the dung-court, and found insufficient to raise a turnip crop without the addition of more potent compost? Why, because the materials are more exposed, and the evils already pointed out are allowed in this case to operate in an aggravated degree; the cattle drop perpetually over the whole, this is more generally mixed with the old materials, and upon the surface, where it is fully exposed to air and moisture; and the gases rising freely are exposed to the passing breeze. The materials used are the same in both situations, and with similar treatment, the manure should be so also. I have questioned several farmers, who are otherwise intelligent, on this head, as to the nature and effects of compost prepared in the field, when they replied that it was very good, but that it would not raise turnips without being mixed with hot dung, which is sufficient to show that they were ignorant of the principles by which they should be guided, and of the value of what it ought to be their chief object to preserve.

The gardener, for the purposes of his hot-beds, selects the freshest and strongest materials from the dung heap, which he exposes to air and moisture in order to induce as much action as possible, and in this excited state he applies them to the beds; in the course of a couple of weeks it is found necessary to use a portion of fresh dung, which is repeated at certain intervals until the advance of spring renders artificial heat less requisite.

The compost used in this way is ultimately found to have retained less of the stimulating gases than what is prepared in the dung court, but more than what is made in the field, as in this last situation the original materials are exposed and constantly excited by the droppings from the cattle on the surface.

The extremes of production in different situations are most remarkable; chiefly arising from more or less means to manure, and the measures adopted for this purpose.

In Mr. Jacob's Report on the agriculture and returns from the lands in the northern countries on the continent of Europe, the annual grain crops from the richest provinces in Poland (Podolia and Volhynia), is stated to be under what is obtained from the poorest districts of Scotland. On the other hand, it is obvious to every traveller that an exceedingly greater proportion of land is annually in grain, and the crops abundant, on every description of soil in Belgium, and the adjoining provinces of France, than in England, notwithstanding that, in the former situation, the grass and green crops are much more limited, and the cattle inferior in size and condition, and fewer in number. Such are the results of management in different situations; whence much useful information may be derived by tracing effects to their natural causes in the habits of the agriculturists or otherwise, and contrasting these with occurrences applicable to the same subject, not only at present but in times past, especially in the last thirty years, during which period turnip husbandry has been brought to high perfection; and this and draining have operated a change on the atmosphere, and the vegetable and animal productions of Britain, beyond what could have been anticipated by the most sanguine imagination.

Whether farm-yard manure be brought to the

consistency only of what the farmer terms long dung; or his operations be carried much farther, as deemed necessary by most practical men, it is certain that these should be conducted on chemical principles, and assimilated to the operations and rules which guide the brewer and distiller. Were the manufacturer of beer, wine, &c. to practise in like manner as the farmer, and continue but for a few days beyond the period of his accustomed operations, repeatedly to add fresh stimulants to his worts, the products of his labour would be an admixture of alcohol, vinegar, and noxious matter foreign to his purpose; in fact not any process in which fermentation is requisite, bears the least resemblance to that of the farmer, and yet no reason has ever been given why he should practise to excess, what in all other cases of fermentation it is the leading object of the operator to avoid. The distiller, after each operation, carefully washes his fermenting vessels with a strong solution of white lime in water, to prevent acidity and the creation of vinegar instead of alcohol. The mixed substances of which farm-yard manure is composed, naturally undergo three stages of fermentation, the vinous, the acetous, and the putrefactive. These follow in regular succession, but if acid be added to wort during the vinous fermentation, this immediately induces the acetous fermentation; or if, in like manner, putrid matter be added, the putrefactive stage is brought on throughout the whole, and heat and action subside sooner in proportion as fermentation has been advanced.

Without a considerable degree of heat life cannot exist in animal or vegetable; and to a certain extent vegetation and circulation in the fluids of plants are increased according to the measure of heat applied to them; it must, therefore, necessarily be important in this view that manure should be used at as early a grade of fermentation as may be consistent with other practical purposes, and that neither the acetous or putrefactive fermentation be allowed prematurely to take place.

Extraneous moisture and air must be excluded as much as possible from the materials of which manure is composed, and fermentation prevented until the time approaches for application to the land, when the atmosphere is usually at a temperature genial to this operation, which should be performed quickly, and to the point that is practically found best. This must depend on the proportion of fermentable properties that shall be preserved in the dung until it is to be deposited in the land, as these alone can induce continued fermentation and decomposition to the extent that is most economical and beneficial to the growing vegetable and the surrounding soil.

Thirty years ago, the distiller from grain fancied that he then extracted as much spirit as could be obtained; but he now produces 30 per cent. more than he did at that period, and half this gain has taken place in the course of the last few years, chiefly, I believe, owing to the Excise imposing duty on a certain proportion of spirits whether this is obtained or not. It would be absurd to suppose that he has yet reached perfection in his art, but difficult to make him believe this.

Experience tells us that fermentation in the materials of the dung heap is more tardy than in worts or wash, and less acetous acid is created, owing to the predominance of fibrous matter, and this containing more of those properties which induce these effects.

The following mechanical arrangements and

process are, such as appear to me, likely to serve the purposes of consolidating and protecting the materials of the cow-houses and stables on a farm from the deteriorating influence of rain and air until the proper season for fermentation, immediately previous to the manure being applied to the land.

A shade must be formed on either side of the cow-houses and stables, as found most convenient, from twelve to fifteen feet wide, by means of light rafters, the upper ends of them resting on the wall of the buildings, and the other extremities on a plate placed on a range of posts at a distance above mentioned from the wall. This shade may be subdivided into three equal compartments by common draw rails, and there should be an opening in the wall opposite to each of these divisions, in order conveniently to throw the dung and litter into the shades, as also smaller apertures for the urine to pass. The stock should be occasionally penned in one or more of the spaces in the shade, according to the quantity of the materials and number of animals, for the purpose of trampling and consolidating them, and this operation must be commenced with the first removal of dung and litter. The floor of the shade may be of any firm retentive material, sloping from each side to the centre. There should be a well to receive what moisture may sink from the materials, by means of a gutter the whole length of the shade, and the liquid so received must be there, or in some other commodious place, mixed with moss or mould, so as to bring it to a consistency that will prevent fermentative action until the period for general fermentation, when this may be incorporated with what had been prepared in the shade, or otherwise reduced to a more fit or less pungent state by an admixture of such matter as may be found best adapted for the land to which it is to be applied.

When a certain quantity of materials shall be collected in the shade, these may be forked out and placed on a dry site, with a lair of moss or mould in the bottom to absorb the liquid; the heap to be made in a compact form, compressed, and rounded on the upper surface. Moss or mould should be put into the bottom of the shade, and this placed on the upper part of the heap when removed, with clay, marl, or turf on the upper surface of the whole, and rounded and beat down so as to exclude air and moisture from the interior. This operation of removing and covering up the materials may be performed monthly, or more frequently if thought advisable, and if possible in dry and cold weather. When this compost is to be fermented, it should be turned over, exposed to the atmosphere, and considerably moistened, and, when sufficiently reduced, deposited in the land as soon as possible.

When this last process is to be performed, in order to effect the measure of decomposition requisite with rapidity, dry straw introduced into different parts of the heap may be found to keep it sufficiently open for the admission of air; but it is not economical then to decompose this straw, which should be removed into the shade when the other materials shall be sufficiently reduced.

It might be found more convenient if the preceding directions were so far deviated from, as to separate the urine from the dung and litter, and to allow it to pass from the stock to a recess under cover, where it may be mixed with moss or mould as already described.

W. S.

# LORD WESTERN'S SECOND LETTER TO THE PRESIDENT AND MEMBERS OF THE CHELMSFORD AND ESSEX AGRICULTURAL SOCIETY.

"*Vain all Reforms, until Parliament restores to the industrious those legitimate fruits of their industry of which the mistaken Legislation of 1819 has deprived them. No innovating reforms for this purpose are necessary; a recurrence to ancient law would, in a great measure, if not altogether, correct the error, and give that relief which is essential to the ease and content of the people, and the safety and prosperity of the empire.*"

Bath, May 15, 1835.

SIR,—I flatter myself that in my former letter I convinced you that the contraction of the currency, by the Act of 1819, is the *true* cause of the misery that we have suffered since that time, and which is daily becoming more grievous. I cannot think that the statement I there displayed of the deficit in the money receipts of every farmer occupying one hundred acres of arable land (amounting to 325*l.* annually \*) can be disputed, and if correct, it showed the futility of any adequate relief to be obtained by a reduction of taxes, seeing, especially, that the taking off thirty-six millions *appears* only to have increased our misfortunes. It certainly is curious that our distress should have increased *pari passu* with the diminution of taxation. Grateful ought we ever to be to those senators who watch over the public purse, and cut away superfluous expenditure—check extravagance, and root out corruption; but the skin-flint and cheese-paring system will not do in this country. We cannot go on without a free and pretty large expenditure. Retrenchment of individual expenditure certainly can only add to the distress of the industrious and working population. If I resolve to be economical—to retrench, I know, full well, that I can only do it at the expense of some one or other, or all of the various classes of mecha-

\* I suppose a farm of one hundred acres, of fair, good arable land, well cultivated upon the four course system, the produce of wheat at 3½ qrs per acre; barley 5 qrs; beans and peas, 3½ qrs. Wheat, during nearly a quarter of a century, from 1797 to 1819, had averaged 80*s.* the qr; fifteen years preceding 1819, 85*s.*; the rent founded upon these data, I take at 35*s.* per acre. The moment the Bill passed, the markets fell 30 or 40 per cent., and in the fifteen years succeeding, the average prices has been, as near as may be, 55*s.*: it has subsequently fallen still lower, and is, I believe, now only 40*s.* I therefore consider the price of wheat to have fallen on an average 30*s.* per qr; barley, 20*s.*; beans and peas 20*s.* Upon these grounds, I estimate the reduction of money receipts of the farmer upon 100 acres to amount annually to 325*l.* The reduction of price upon clover, tares, and turnips, is loosely estimated, but moderate. I take no notice of the change of price of various minor articles, the produce of such a farm. This aggregate and enormous difference in his return, I think, I clearly establish upon the following calculation. I take the produce on the four course system to be as under:—

|                   | ACRES. | QRS.        | DIMINUTION.         |         |
|-------------------|--------|-------------|---------------------|---------|
| Wheat             | 25     | 3½ per acre | 36 <i>s.</i> per qr | £131 15 |
| Barley            | 25     | 5 ditto     | 20 <i>s.</i> ditto  | 125 0   |
| Beans and Peas    | 12½    | 3½ ditto    | 20 <i>s.</i> ditto  | 42 0    |
| Clover            | 12½    |             |                     | 15 0    |
| Turnips and Tares | 12½    |             |                     | 12 0    |
| And fallow        | 12½    |             |                     |         |
| Acres, 100.       |        |             |                     | £325 15 |

nic or labourers to whom I have directly or indirectly given employment. Retrenchment is the order of the day, I know; and low prices and low wages the favourite theme of a certain set of politicians. By the bye, I wish the *operatives* and *labourers* throughout the United Empire clearly to understand, that what these politicians intend by *low prices*, particularly of corn, means neither more nor less than *low wages*. They say, we cannot sustain our *foreign* commerce unless we keep down the wages of labour. I, however, confidently maintain that, under the peculiar situation of this country—its enormous debt, contracted in a credit currency—its necessary public charges—its unparalleled and varied products of industry—its immeasurably vast commercial operations and increasing population—THAT NEITHER MANUFACTURER NOR MERCHANT WILL MAKE ANY DUE PROFIT TILL THE PRODUCTS OF THEIR INDUSTRY RETURN A COMPARATIVELY HIGH MONEY PRICE; NOR WILL WORKMEN OR LABOURERS GENERALLY HAVE COMFORT OR PLENTY TILL LABOUR BEARS A HIGH MONEY PRICE; NOR THE COUNTRY ENJOY EASE AND PROSPERITY, WITH A FLOURISHING REVENUE, TILL ALL THE PRODUCTS OF THE PLOUGH, THE LOOM, AND THE SAIL, BEAR A HIGH MONEY PRICE. There are persons who imagine that a check to our *foreign* commerce would be the consequence of such increased money price; but they are either egregiously uninformed, or have some sinister motive in drawing the public into the belief that the *low price* occasioned by Peel's operation upon the currency is the same thing as *low price* occasioned by skill, ingenuity, capital, judgment, and general facility of production and conveyance to market. It shall, however, be my *more immediate* business to endeavour now to show the justice of an opinion I hazarded in my former letter, namely, that it would be for the interest of the creditor as well as debtor, to consent to an alteration in our monetary system.

I said that if a creditor would cast his eyes a little forward, and make a *fair estimate* or *balance* of advantages or disadvantages, he would see his interest in it as well as that of the debtor. The alteration I look to is certainly directed to an *extension* of the circulating medium—*safe, steady, and permanent*, which would give a higher money price for all products of industry and labour, and consequently as far as the extent of such increased money price, be an injury to debtors *merely* as such. I must therefore assuredly look to the *increased stability* of the debtors for a portion of the advantage to the creditors; and let not the creditors weigh lightly this advantage. If there is any man in the country who, in contemplation of the CONTINUED and INCREASING pressure of the industrious classes consequent upon our present currency, is yet blind to danger, his mind must be of a singular construction indeed: but, do not let it be supposed that, in order to alarm the public creditor, I am going to hold out the probability of an attack upon the funds. I am thinking of the absolute INABILITY of the public and private debtors, in many cases, to fulfil their engagements under the present increased and increasing diminution of their means; and I would wish the public creditor to bear in mind the *reduction of interest* he has been obliged to submit to, and which was accomplished in order to *reconcile the public* to the Act of 1819. Without looking to any violence, I ask if creditors can fail to see, from a variety of indications, the determination of the country, sooner or later, to have some relief? Does not the multiplication of banks show, for instance, the *general desire* for an *extension* of the circulating medium? and do they not see that this desire is founded upon the *actual* and *irre-*

*sistible necessity* there is for such an *extension* in reference to our incredibly vast financial and commercial wants of every description, and our greatly increased population? Do they not see they would be benefitted by granting a safe, well-regulated *extension*, rather than hazard the risk, though remote, of a forcible operation on the currency, under irritation, haste, alarm, and inadequate guidance? The industrious classes acutely feel the want of something absolutely necessary to them, and when they learn what it is (a knowledge not much longer to be withheld from them) their demands will be irresistible. In the mean time an incessant struggle is going on for the increase of the circulation by means of these banks and every species of credit currency; but it cannot be SAFELY accomplished while Peel's Bill† is in operation. This incessant struggle, therefore, for what is so feelingly necessary, must end in the overthrow of that Bill, though not directed immediately to that object, certainly not confessedly to the removal of it from the STATUTE BOOK, and the reason is—because it is still very generally supposed the currency may be increased *without alteration of its provisions*.

AN EXTENSION of the CURRENCY by means of these Banks would, if it were PRACTICABLE, as *effectually* alter Peel's Bill as if the provisions of the enactment were altered; and this leads me to considerations, to which I request the *particular attention* of those who at all direct their thoughts to this most important subject.

Let it, then, be observed, that every successive Ministry since Peel's Bill have, in fact, shown that they were to a degree *conscious of its mischief*. They have—at times—if not permanently—encouraged an *increase* of the circulating medium, though such increase, they could not fail to know, would as effectually alter the money value of every species of property as if they had altered the standard price of the ounce of gold. The Lords Liverpool and Castlereagh, in the distress of 1822, distinctly declared their intention of raising the price of corn, &c., by a forced increase of the circulating medium (Bank of England paper). Now, upon what principle it can be justifiable to alter the standard of value by an increased circulation of bank notes, and wrong to do it by *changing the standard from gold to silver*, for instance, is to me perfectly incomprehensible. To alter the metallic standard in any way is, they say, a robbery, and I know not what. To alter the value of every man's property by increasing the amount of bank notes in circulation is highly praiseworthy. In 1822 corn was as low as at present, and all the products of agriculture and the wages of labour as much or more depressed. Wheat had sunk to 5s. the bushel. Mr. Cobbett foretold, as early as 1818, certainly more distinctly than any body else at that time, that a gold standard at 3*l.* 17*s.* 10½*d.* would inevitably reduce the price of wheat to 4*s.* 6*d.* or 5*s.* the bushel on the average, and other commodities in a similar ratio, nor would it have risen upon an average since 1819, but for the different means that were found to prevent the full operation of that measure. Our statesmen were as little informed as babies of that which Mr. Cobbett understood so well, or otherwise fancied they could counteract the effects which that adjustment of the *metallic* standard would induce. They were such casuists as those who keep the promise to the ear and break it to the sense, that is, they resolutely determined to main-

tain the gold standard at 3*l.* 17*s.* 10½*d.* and at the same moment make it nugatory. Thus, upon a motion I submitted to the House of Commons in 1822, for an inquiry into the state of the currency, Mr. Huskisson moved a resolution to the effect, that the House would listen to no alteration of the standard in its denomination, weight, or fineness; whilst, at that very moment, Lords Liverpool and Castlereagh were engaged in the furtherance of means to *raise* the price of wheat from 40*s.* to 70*s.*, which was *accomplished* by forcing out an increased issue of bank notes—in other words, by an *extension* of the *currency*. A loan of 4,000,000*l.* of the Bank was amongst other measures adopted by government for the express purpose of increasing the amount of Bank notes in circulation. Lord Liverpool, in a speech the 26th February, 1822, said, *this sum, be it remembered, is not wanted for any government services, the only object of his Majesty's government is to EXTEND and QUICKEN the circulation*; and so effective was this operation that not only was agriculture relieved, but every other class of society felt the reviving influence, and the then Chancellor of the Exchequer, Mr. Robinson, was almost intoxicated with delight, in contemplation of the short lived happiness which every where prevailed. Alas! little they knew of the consequence or power of the *gold standard*. They were perfectly unaware of the consequences, namely, that these *increased issues* would inevitably come tumbling back upon them in the course of a short time; which was unhappily the case, producing such complete and ruinous derangement of all commercial operations, and money engagements, that universal distress prevailed, and what was termed the panic ensued. The temporary gleam of sunshine which these increased issues produced shewed us, however, most distinctly, that an extension of the circulating medium, upon just and permanent principles, was and is all that the country requires; that granted, and the full tide of prosperity would flow in upon us. Lord Liverpool, in a speech of Feb. 16th, 1826, said in March, 1825, they (the Bank of England) saw the necessity which was pressing on them, and they *then* began to *draw* in their issues. In the month of March they reduced the issues £1,300,000; between the 15th of March and the 15th of May, they made a reduction to the extent of £700,000 more; between August and November they further contracted their issues, making altogether a contraction of £3,500,000, and yet the noble lord and his colleagues could not or would not see that the working of the gold standard, upon their measures of 1822, was the cause of this withdrawal, and the calamitous consequences that followed. And here let me observe, by the way, that these National Banks will, if their operations should effect a considerable increase of the circulation, to which they obviously tend, occasion sooner or later, as decisive a run upon the Bank of England, for arbitrarily fixed low priced gold, as the performances of Lords Liverpool and Castlereagh with the Bank in 1822, did in 1825. I should like to know how that result is to be avoided. I wish the directors or any of them, to enlighten the public on this very important point. I ask them, first, whether or not their operations will increase the aggregate circulation of the country, and, if they do so, whether, as matter of course, the *money* price of commodities will not advance, and, in such case, whether the price of gold not advancing, there must not be a *RUN FOR GOLD*. I ask, how it can be otherwise? Gold is *ARBITRARILY* kept down to the price of £3 17*s.* 10½*d.* the ounce; the Bank is liable to be drawn upon to the extent of *thirty millions in gold*, at *THAT* price; and, of course, whilst other commo-

† Peel's Bill means our *present monetary system*, or *present currency*, or *present circulating medium* based upon our present fixed gold standard.

dities have RISEN, a profit attaches upon the acquisition of gold at THAT arbitrary statute price, and the demand, or as it is called, run for it, follows of course. The recently improved condition of our manufacturers may be perhaps mainly occasioned by the issues of those banks, but it must be temporary.

Upon these grounds, then, I say, that creditors cannot wisely expect to continue much longer the full, and, I must add, unjust advantage which they possess over the debtor, and the industrious classes, and which they have so long enjoyed under Peel's Bill. Our statesmen yet pretend to be very determined upon its maintenance; but they will no more keep from us, eventually, that currency which is necessary to us, than they can the air we breathe. Our present monetary system cannot stand much longer. It is working cruel, dreadful mischief every way. Instead of being a sound metallic inartificial currency, of unvarying, unchangeable value, it is artificial and fraudulent, because it pretends to be what it is not. It is eternally fluctuating, and operating a continual change in the money value of property of every description.\*

Let us examine it a little attentively. The law enacts, that the only money with which a person can fulfil a contract and discharge a debt, is in gold, at £3 17s. 10½d. an ounce, or, by a late statute, in *Bank of England notes*; which the receiver may, however, carry to the bank and demand gold for at that price. The public creditor can demand payment of his dividends in gold; but the practicability of so paying them is just as easy as it would be to divert the sun from its course. The interest of the funded debt of every description, and charge of management, and the interest of the unfunded debt, and payment of the dead weight, together amount to more than 33 millions annually. No man, of course, in his senses, can suppose the payment of these millions in gold possible. Well, the Bank of England is liable to be called upon, at any time, for thirty millions of gold, by the holders of these notes, and the depositors: their ability to produce it is equally out of the question; they tell you now themselves that they have not seven millions in their coffers. Our currency, then, is *not* a metallic currency, as is pretended—it is to all intents, a CREDIT CURRENCY: our national debt, principal and interest, can only be resolved into a Credit Currency. But then, it will be said, that its legal (though not practicable) convertibility into gold at a fixed price, renders it *equable*, and prevents excess and depreciation, and, in effect, constitutes a measure of value, if not a medium of exchange. It does limit the amount of our credit currency, that is to say, prevents its extension with SAFETY beyond a certain amount; but still there is such a power of expansion and contraction sufficient to effect such fluctuations in the quantity and consequent value of the currency as to produce the most ruinous consequences to individuals, and the mischief arising therefrom is incalculable. Besides which, the amount which can be safely and steadily maintained is much below what the exigencies of the country absolutely require; an approach to which, should the Bank of England attempt it, places itself in a constant state of peril. The lower amount of credit currency, the less peril to the Bank, whilst, on the other hand, the more extensive its issues, the larger its profits.

*Bank of England notes constitute, in point of fact, the*

*currency of the kingdom. They form the BASE of all our credit operations; the mighty mass of paper, of every description, is based upon the Bank of England notes, and the amount of them in active circulation does therefore determine the aggregate amount of our circulating medium, and, consequently its value. It is a most curious and indisputable fact, that the Bank does therefore as distinctly determine, at its discretion, the value of the currency, and, consequently, the money price of commodities, as if they had the royal power of the mint to its fullest extent ever exercised, of adding to or diminishing the quantity, or altering the quality of the coin. The Bank influences the price of corn more powerfully than the seasons, and in case of scarcity, might fearfully counteract the evidence of that scarcity. I will suppose a bad harvest, and a consequent rise of prices; if, at the same moment, the Bank should contract its paper, we may have a scarcity and a low price; and this case is not only possible but very probable; it demands particular attention, and is of such a nature, that I cannot hold any Minister free from heavy responsibility who longer neglects to turn his attention to it. There is no statesman—hardly any man of the least reflection—who will now deny that the contraction or extension of Bank of England paper materially influences the money price of commodities, and of corn in particular. Admit, then, that the Bank is under the NECESSITY of contracting at the moment of a defective harvest, and a false conclusion is the result, and deception, too, dreadful in its consequence. And it is rather curious that a scarcity, and consequent importation of foreign corn, is in itself likely to force the Bank to contract its issues, because a large import of foreign corn is known by experience, to have a tendency to draw out gold; the heavier the import the greater the flight of gold, and the more prompt must the Bank be in its contraction. Destroying, thereby, the TEST by which the adequacy of supply to demand can be ascertained, and closing the doors to that relief of which the people may stand in absolute need, and even if supply from abroad met with no impediment from the laws, the false conclusion as to proportion of supply to demand would be induced, consequent upon the diminished price which the flight of gold and the contraction of the paper would inevitably occasion.*

Exclusive of this most important view of the subject, what a power does the Bank possess, extending equally over the markets of all other commodities. I do not believe they abuse it; though to merchants, and other moneyed men, how great is the power, and how great the temptation. But suppose them actuated, as I dare say they are, by the highest sense of honour and integrity, a variety of circumstances will often prevent the exercise of that power, according to their best discretion.

The Bank has about eighteen millions of its notes in circulation. So many are required—more, in truth, are required, but as they feel they may be called upon to do that which is quite out of their power, they are obliged to regulate their issues, not by the wants of the country, but by a variety of extraneous circumstances, both foreign and domestic, which have, in their estimation, a tendency to cause a demand for gold. To check such tendency, they are compelled to contract their issues of paper, sometimes very hastily. Now a comparatively small demand for gold may cause a threefold withdrawal of notes; that is to say, one million of gold in demand might cause a reduction of three millions of bank notes; three millions of bank notes cause a reduction of nine millions of other credit paper; and down comes the market money price of all commodities, and labour

\* The allowance of one pound notes in Ireland and Scotland, and not in England, is an anomaly in the present system which further renders its permanency very improbable.

likewise. The apprehension removed, and every motive of interest, duty to the country, probable urgency of the Government, induce again an extended issue, followed by an increase of all the rest of our credit currency, and the markets again advance, and trade revives; and thus have we been going on since 1819. I am astonished how any body of any thought or reflection at all, and the least knowledge of our commercial operations, can say that we have a metallic currency. If there was any extensive demand for gold, there is not enough in the country to pay the population one sovereign per head; and what advantage is it that a few persons in power should, in the scramble, fill their coffers. The metals are hardly used in any payments above five pound. I believe five per cent. is hardly received by any landlord in payment of rents, and bills are all discharged in bankers' cheques or paper of some description.

This review of our monetary system, and its necessary operation, can hardly be refuted, and it must surely be admitted to be obviously bad. It is productive of most cruel commercial disappointments, and often causes the ruin of persons engaged in *honest beneficial, and judicious commercial speculations*, if the Legislature and the country will have a credit currency convertible into the precious metals at a given price, with the view of keeping an *equable measure* of value; for I think nobody can expect their extensive use, as a medium of exchange, in our present commercial and financial operations. It would be assuredly and obviously far better to take our ancient standard, *silver*; and make it again the *sole* standard, because all experience has, I believe, shown that it is impossible to keep the *double standard*, inasmuch as variations in the value of one or the other will occur, which, as the case may be, leads to the expulsion of the one or the other. This exchange of the silver standard for the gold, I am convinced would prove a considerable amelioration of our present monetary system; and what possible objection? The *SINGLE* gold standard is *MODERN*; it is *not* the *ANCIENT* standard, as is said and generally believed. Prior to the reign of Edward III, our standard was *silver*, and *silver* must therefore be *properly* called and considered our *ANCIENT* standard. Gold pieces were first issued in that monarch's reign; from which time, till 1816, a double standard existed, which, as compared to our *present*, may be familiarly called our ancient standard. The single gold standard was adopted in 1816, for what reason, or at least good reason, it is impossible to imagine. Nobody hardly knew of the change, nobody asked for it, nobody opposed it. The Ministers who advised could know little of its probable mischief, though they might have known that gold was a much more *FLIGHTY* article than silver, and, consequently, dangerous where combined with so extensive a convertible paper currency. Now if there were no objection to a change of the *ancient* to a *new* standard, that new standard being found injurious, what possible objection to going back to the *old*? It was surely a stronger measure to alter the *old* than to recur to it upon the discovery of disadvantages in the *new*. In the case of the adoption, I would make no alteration of the coin; take *silver* as at *present*—a pound of silver coined into sixty-six shillings, as it now is; let there be sovereigns coined as at *present*, but not denominated except at their *MARKET* price, as in France; legal payment then would be effected in silver at its *PRESENT* price, in *present* coin, or in *bullion*—say in *bullion* above five pounds. The person holding *paper*, and requiring to be paid in metal, would have the silver tendered to him, the *inconvenient* load of which, if he

considered *important*, he would take in gold, paying three, four, or five per cent. *agio*, or *premium*, as is the case in France; thus should we have, perhaps, even an increased quantity of gold in circulation, whilst the Bank would be relieved from a *portion* of that danger to which it is subject when liable to be called upon in *gold*—the metal which is *incomparably more subject to hasty and sudden demand*. Silver is the money of the whole civilized world. There is reason to suppose the produce of the mines more likely to keep pace with the increased demand for it than gold. This more precious article is stated, on the best information, to be more and more scarce, whilst the demand for it is immeasurably increased and increasing; and here is a further cause of the *increasing* pressure upon the *industrious* classes and debtors, who, whatever may be the sterility of the gold mines, are compelled to furnish the same quantity at the same price, or an equivalent in value to the extent of thirty-three millions, to the public creditors, and, in like manner, private creditors; and if the gold mines become less and less productive, and the demand keeps increasing, the fatal robbery of the debtors and all the *industrious* classes, from the highest to the lowest artisans or husbandmen must continue in proportionate progression; and where a country has such a *debt*, and half the population are debtors to the other half this *monetary system* becomes *obviously unsuited to its object*—the weight of our enormous *debt* and *taxes* becomes dependent upon the *uncertain* produce of the *mines*, and, under present circumstances, indisputably adding to the pressure upon the *industrious* classes and debtors.

I know not how any statesman can do otherwise than shudder under the apprehension of an increasing scarcity of gold, if he turns his eye for a moment to the enormity of our debts and the condition of the *industrious* classes. In former days before the existence of a National Debt, and the extension of commerce, the present monetary system may have answered the purpose; but, even then, the necessity of an increasing quantity of the precious metals, relatively to the increased demand, is made *apparent* by the reduction of the value of the coin progressively, which has taken place in all countries from time to time. In this country the pound sterling was a *pound* of silver, divided into *twenty* shillings; now a *pound* of silver is divided into 66s or an ounce into 5s 6d; in the reign of Elizabeth, into 5s 2d; this is the only alteration that has been made since that time. I believe a considerably larger was progressively necessary, and is still necessary, to do full justice to the *industrious* classes and debtors, because the demand for the precious metals has increased so much faster than the supply. In France, the *livre* indicated a *pound* of silver; now it is only worth tenpence.

The circumstances I have here brought to view distinctly show the necessity there is to give the fullest, the deepest consideration to the means of improving our present monetary system and adapting it to our present situation. I am confident that the necessary means may be found in this country to accomplish such an improvement. It is that which alone is wanting, and obtained, would give such a spring to the country as would astonish the world and even ourselves. We must find our way to it by degrees and I think the first indisputably safe step would be to recur to our *ancient silver* standard, with no other deviation than that of making it legally that which it was in *point of fact* effectively silver only, instead of a single gold standard.

Sovereigns should be coined as at present weight and quality, to be current as in France, the shillings the same as at present likewise. Everything, there-

fore, would remain the same, and the Bank would in a great measure be relieved from its present most perilous situation, and placed in one of comparative safety, and consequent greater ability of steady supply to the country of such accommodation of every sort which our vast commercial and financial operations require. If this system should prove sufficient, we might stop there; if not, it would help us to the discovery or unfolding of further means which may be requisite.

I have dwelt so long upon this review of our present monetary system that I fear the creditor may think I have forgotten him altogether; but the subject will be my apology; and I cannot but hope, that in thus treating it, I have taken the best means of convincing him of the wisdom of inviting rather than opposing an amelioration of the existing law, notwithstanding the advance of money price of commodities and of labour, which would be the effect of the change. But there are other circumstances worthy his attention; and here I cannot help reminding him again of the reduction of interest of the five and four per cents. I am unwilling to go at length into an examination of the means by which those operations were effected: but I am convinced if we had not adopted the currency measure of 1816 and 1819 (Peel's Bill), that reduction of interest would not have taken place. There is another matter to which I wish to draw his attention, rather more perhaps in the character of a moneyed man than the creditor, and the confidence I feel in the truth of the position I am about to advance, emboldens me to hazard an apparent contradiction, and paradox: I say then, his money would be more valuable if the aggregate quantity of the currency were increased; the reason is, that there would be a more extensive demand for it, a higher interest of course, and better security for it. Under our present system, such is the uncertainty of the markets, so frequent have been the failures of the best conceived commercial and agricultural undertakings, so very little the profit in general even in success, that although nothing can extinguish the energy and industry which characterize the British character, yet their exertions have been to a degree damped, so that on the one hand the demand for money, and on the other confidence in lending it have been so diminished, that money has been at times comparatively a drug, has fled the country altogether, and been collected in large masses in London, little productive, and commanding hardly two per cent. there. Bankers must be aware of the truth of this remark generally: where it has been otherwise, it has been the exception. The vast loans to foreign countries are, amongst other circumstances, strongly corroborative of the fact. Upon looking to the price of the three per cents. in successive years, I find they were nearly 97 in 1824, when the forced issues of the Bank were the largest. I cannot draw from thence any decisive conclusion as to the permanent effect upon the price of our capital stock, consequent upon the increased circulation which may arise from the change of the standard from gold to silver; but I think it is sufficient to relieve the fundholder from any apprehension of any fall of the capital stock consequent thereon. I think there would be no necessity for an expansion equal to amount forced out in 1823-4; at all events, it would be far more gradual, and not calculated to invite that ardent speculation which the sudden and very enlarged issues of Bank paper occasioned at that time.

I am aware that it is perfectly easy to raise a number of objections to the detail of execution of this or any other alteration of our present monetary system; and I am aware also there are many difficulties to

overcome, and inconveniences to obviate, which I could not point out the means of effecting—probably no one individual could; but I have not the shadow of doubt that a ministry, with the efficient aids they might command—the advice of the most discreet, practical, and honourable men—would readily accomplish the work; and I do think that they will be more deeply responsible than any who preceded them if they now withhold their attention from this most important subject. I say more, because every successive year has more unequivocally marked the dreadful consequences attendant upon our present system; the actual depressed state of our agriculture, now, for the second time, brought down to a condition alike ruinous in their respective stations to the landowners, occupiers, and labourers, loudly cries for attention, serious and persevering, on the part of Government and the Legislature.—I say, such a visitation, a second time cannot be overlooked—the miseries and alarm of 1822 cannot be forgotten. This brings me to the case of Ireland in 1822, where such an exhibition of suffering, poverty, and actual starvation prevailed as was hardly ever known in any other civilized country in the world, and that in the midst of abundance of grain of every description, at a lower price than had been permanently known for centuries. Ireland exported that year in wheat, including what was converted into flour, nearly a million of quarters, and immense quantities of oxen, sheep, pigs, salt meat, &c.

So much for the effect of low prices, consequent upon scarcity of money; and what is to prevent a recurrence of these evils, if the low prices continue? I say Ireland is suffering from low prices, and has suffered more from low prices since 1819 than from any other cause. A very intelligent land-agent in Ireland writes to me as follows:—"Whether taxes were nominally greater or less, rents high or low, the industrious, the intelligent, the frugal, as well as the reckless, have all been advancing to distress since the year 1819? An extensive opportunity of viewing the matter afforded me by my laborious, and every year's more laborious experience in the letting of ground and the recovery of rents, had convinced me of those two facts, that the pound sterling, as established by the act of 1819, was much more valuable than it ought to have been, and that the circulating medium was too scarce. The consequences in this country have been to compel the farmer by degrees to recede from all his comforts, or render him reckless." It is evident, to restore him those comforts nothing will do but a correction of those mistakes, and it is equally certain that would do it, and without it other means would be futile and unavailing. Here again the banking efforts show the want of an extended circulation; but they cannot accomplish what is needful whilst the gold standard remains, nor will their small note currency avail. Ireland would profit by an extended currency as much if not more than any other part of the empire; and feeling its general influence, would receive in a happy state of mind any other boons which may be granted. But nothing can satisfy there nor here, whilst the pressure on the industrious classes continues so severe.

Another consideration which renders attention to the subject more imperative now, arises out of the changes which are making by the great Continental States in their currencies with a view to the introduction of a considerably larger proportion of the precious metals, as compared to their paper. The United States have also very recently adopted gold into their currency, though they have more wisely than our government, fitted their gold to their silver

standard. Nobody can doubt that those measures must very materially affect us, and mainly increase our difficulties. Our condition is, in effect, quite altered from what it was at the time of the passing of Peel's Bill, and forms an *entire new case*, obviating any fair charge of inconsistency on the part of any persons who formerly maintained, and now may wish to alter it.

Well do I know what the dogged opponents of any currency reform will say to any plan of amelioration that can be proposed—'you want to tamper with the currency, and rob the public creditor.' Now as to tampering, I cannot admit that to be tampering which requires only a recurrence to an *antient* standard, nor should I any stronger measure, the necessity of which is marked by evidence not to be mistaken; and, if the proposed remedy is not sufficient, I say there is evidence in our present state to require a stronger. No statesman will deny that Peel's Bill occasions a severe pressure upon the industrious classes, and will anybody tell me upon what principle it could be justifiable to induce an additional pressure to that which a capital debt of eight hundred millions must occasion, or to continue it when its severity is so marked as it is now? Peel's bill was, in one point of view, a tampering; namely, that the COUNTRY did *not* require it. There was no such thing as a petition for it ever heard of, that I can recollect; the public creditors did not ask for it; one of the largest and most sensible, the late Sir Robert Peel dreaded, deprecated it; I knew and foresaw all the evils it would occasion. In fact, it has strewn with thorns the path of every minister who has since held the reins of government, and turned the minds of the people against their rulers and the higher orders, by the continued oppression it has occasioned. The people know not the source of the oppression. They feel it severely and become consequently the dupes of designing agitators and ambitious demagogues, who urge them on to pulling down one thing after another till we shall hardly have a remnant of our institutions left. I firmly believe that it will be impossible for any ministry to govern the country happily till that ruinous measure of 1819, which, unfortunately for Sir Robert Peel, has taken his name, is materially altered. Our projected reforms will give little or no relief from its pernicious influence, and therefore only lead on to further and endless demands.

The Act of 1816, by which the single gold standard was adopted, was a decided tampering, because not required. Every expansion or contraction of issues by the Bank is a tampering, because the value of the currency is on each occasion varied. Now as to *robbery*, when creditors cry out robbery, it puts me in the mind of the thief who turned upon the man he was robbing, and charged him with the theft.—Never was a people so robbed as the people of this country have been by the operation of Peel's Bill: the plunder has been continued from the time of its passing to this hour, and is in full activity now.

In conclusion, I have only to express my earnest hope that the Society of which you are the President will follow the example of the East Suffolk Society and appeal to the Legislature for relief from the most destructive infliction under which the agriculturist of any country ever laboured. At all events require a thorough investigation of the causes which have led to their present unhappy condition.

I am, Sir, your faithful and obedient servant,

WESTERN.

To the President of the Chelmsford and Essex  
Agricultural Society.

P. S. There are two or three recent works which

I strongly recommended to your attention—*State of the Nation*, published by Saunders and Ottley, also, *The Country Banker*, and *Works of Henry James, and Taylor, of Bakewell*, and *Catechism of the Currency*.

## IMPORTANT TO LANDLORDS AND TENANTS.

TO LORD WODEHOUSE, CHAIRMAN OF THE CONSERVATIVE DINNER, EAST NORFOLK.

MY LORD—In your Lordship's reported speech, delivered at the above dinner, you say, "Then as to Reform. How far has that I would ask, contributed to relieve the situation of the distressed—I fear I might also say the ruined agriculturist?" and also "that they were duped and disappointed, and detested THOSE who basely and inhumanly deceived them, and who had nothing in view but the promotion of their own selfish objects."

If by agriculturists your Lordship means what are generally termed the farmers or tenantry of the land, you know the government, either Whigs or Tories, can do nothing effectually to relieve their situation, for the only relief they can obtain must come from the landlords and rectors. The King's Ministers can no more controul the price of corn than they can govern the winds or waves, consequently they have no means of giving effectual assistance to the distressed and ruined agriculturists at the present moment. The true state of the case is, the tenants have contracted to pay at least 50 per cent. more rent and tithes than they are now worth, and unless they have an immediate reduction, at that rate they will become bankrupts. It is a private and ruinous contract between landlord and tenant—the Government can not interfere, and the tenants must look to the landlords and rectors to release them, as the only possible way of escape. It is a complete "delusion" and an "inhuman deception" in landlords and rectors to tell the tenants that the Government must do something for them, when every direct tax, upon a farm of 200*l.* a year, has been repealed—and if the whole of the malt duty was taken off it would benefit the landlord much more than the tenant, and that circumstance would then be used as an argument by the landlord and rector to exact the present ruinous rent and composition. The rents were raised to the present amount when wheat was from 70*s* to 80*s* per quarter, and the landlords expected, under the operation of the Co.n Laws, the prices would never be lower; however being disappointed in that expectation, it is now only justice and equity to reduce them 50 per cent.

It is generally believed half the tenantry are much in arrear with their landlords, if not absolutely insolvent. As one proof of this fact, on the 9th of April last, THREE days after the quarter day, a Tory Clergyman made a distress on his tenant for eighteen months' arrear of rent, when every article of furniture, even to the very bed he slept on, with his cattle, &c. were sold, and he was obliged to give up a farm he had occupied more than 30 years. Another case of a farmer, under the same landlord, left his farm at Michaelmas last, and having thrashed and sold his crop of corn, it produced little more than sufficient to pay his rent and tithes. He is a very industrious farmer, and in neither cases was any abatement made in a rent of about 40*s* per acre. These facts prove what is the real state of some of the tenantry or agriculturists, and what is the probable prospects of many of them.

Now I would ask your Lordship, has Govern-

ment any power to give relief in such cases, or can the tenantry get any assistance but from the landlord and clergyman? their labourers, tradesmen, church and poor rates, must be paid, and themselves and families maintained, before any surplus remains for the landlord; therefore I maintain the tenant can look to no other source so long as corn continues at or near the present price.

At the late general election it was the universal statement put forth by the Tories, that Sir Robert Peel's administration would repeal the malt duty and relieve the farmers. Have they done so? No, the farmers are "duped and disappointed, and detest those who basely and inhumanly deceived them, and who had nothing in view but their own selfish objects." Thus are those poor credulous, distressed agriculturists deluded and deceived. They were also taught to believe and expect the price of corn would immediately advance, but being disappointed, they now look to their landlords as a last, though, it is to be feared, a forlorn hope.

It is my only desire, my Lord, to set this matter right, and in its true light, between the ruined agriculturists and their inhuman and unfeeling landlords and rectors. If your Lordship had not so decidedly and strongly expressed yourself on this subject in reference to the Reformers, and, in my opinion, so unjustly and intemperately, it would not have been noticed by me, and in so doing I have only applied your own words. But when I see the first nobleman, and his Majesty's Viceroy of the county, sending forth such statements, it, I think, becomes every one, however insignificant his station, to oppose them, and put forth the real state of the case for the benefit of my brother agriculturists.

I also observe your Lordship's questions, the state of the manufacturers; but, if I am rightly informed, they are now fully employed, with a prospect of great prosperity, so that on that point your suspicions are incorrect. How far the merchant or ship owner is affected I cannot say.

I am your Lordship's very humble Servant,  
A REFORMER and FARMER.

May 20th, 1835.

A very fine crop of *trifolium incarnatum*, or Italian clover, never before successfully cultivated in Lancashire, has been this year grown by Mr. John Formby, on the old race course, at Maghull. We went out to see it the other evening, and were very much pleased with the beauty and luxuriance of the crop, as every one must be who sees it, and who feels an interest in agricultural pursuits. It is above a foot in height, very strong in the stalk, full of leaves, and covered with the most brilliant flesh-coloured flowers in full bloom. A considerable part of the crop has been cut and brought to the Liverpool haymarket, where it has been eagerly bought up at a very high price. It appears to have stood the winter well, and as it is some weeks earlier than the common clovers; it is likely to become an object of some consequence with enterprising farmers. Several of the former experiments tried with this kind of clover have failed, and many persons have therefore feared that our climate was too cold for it; but we suspect that the badness of the seed has had more to do with the failures than the severity of the season, for Maghull, where it has so completely succeeded, is both cold and exposed, being particularly exposed to the north-west winds, and the crop there is remarkably fine. The flower of Italian clover has long been cultivated by florists for its beauty, but it is only within a few years that the plant has been grown for forage.—*Liverpool Times*.

## THE CURRENCY AND THE AGRICULTURAL INTEREST.

(From a Correspondent of the Albion.)

Perceiving that Mr. Cayley has given notice of a motion to inquire into the monetary medium of the country, every attempt to assist the object has the advantage of exciting discussion and enlarging truth. A recent pamphlet of Lord Western to the Essex agriculturists is at once convincing and appalling. It shows the total impossibility of the farmer eventually to contend with his difficulties, and that, even after the annihilation of rent, the suppression of the malt duty, and the commutation of tithes, the farmer is still a loser. According to this statement, the ancient proprietors must gradually part with their estates, and the land be subject to new owners and new occupiers. Indeed, I do not see how any one can avoid the conclusion, that, as the circulation of the country was concurrent with its national burdens, an authoritative contraction of the circulation would increase the remaining national burdens in a ruinous and oppressive manner. Lord Western has shown that 65,000,000*l.* are thus annually lost to the country; and, as 36,000,000*l.* of taxes have been reduced since the war, it follows, that this country still continues to be a loser.

Hence we find, that, after all our palliatives of reduction, after all the attempts of philosophy to indemnify the country, by increasing knowledge, by facilities of colonization and communication, and by improved processes of political economy, every individual feels in his own establishment sufficient difficulties to sharpen his energy, and a very slight reward for almost heart-breaking industry.

To suppose that any real improvement can take place in our general condition, until the currency and the National Debt are in fairer proportions, or until some mighty genius, convincing the incredulous of the evil, demonstrates and establishes the remedy, or until the evil itself burst into an evidence which forces submission and acquiescence, is almost hopeless. Some palliatives may still be admitted, for where the disproportion is so great between the debt and its security, any approximation lessens the evil, and partial relief may contribute to ultimate remedy.

1. Lord Western has wisely suggested the bonding of British malt and British spirits. It was one of the arguments of Sir Robert Peel against the repeal of the Malt tax, that the discountable note of the British maltster to Government for the payment of the duty gave him credit and a capital which the repeal would nullify. The bonding of the article would render this unnecessary, and give more elbow-room to the agriculturist.

2. The extension of silver, as a legal tender, to as great an extent as can be consistent with personal convenience, or, in other words, making gold and silver joint standards, leaving it to the choice of individuals to pay in either metal.

3. The practice of the Bank of England has for the last twenty years been directed to the theory of exchanges. Its accommodation has been grounded upon its principle, and hence, when accommodation has been most wanted, discount has been always most frugal. Publicity of accounts is completely at variance with this principle, and hence the gradual and progressive diminution of the very great security which the recent principles and practices of the Bank of England profess to establish. It seems but fair that Joint Stock Com-

panies, now the rivals of the Bank of England, should, in return for Parliamentary protection, be subject to similar publicity. I say nothing of private banks either in town or country, because it is admitted that not one of them has recovered the ground upon which they more or less stood in 1825. But when we see bad men greedily waiting for the coming disturbance—enthusiasts supporting every change in the hopes of establishing their own hobby, and the lower orders hailing with acclamation every professor of licentiousness and of misrule, we may be certain from the history of nations, that finance is an essential ingredient of the revolutionary cauldron.

G. D.

### AN ANSWER TO THE CHALLENGE FROM "A HEREFORDSHIRE FARMER."

I venture to answer the challenge of the "Herefordshire Farmer," in your Magazine for this month (June) to any one, be he Whig, Radical, or Tory, to point out where the English farmer at the most alarming moment can look for effectual relief. It would be trespassing upon your columns to little purpose, were I to point out, according to my humble judgment, the fallacy of preaching a tithe commutation, alteration of the currency, or reduction of rents as a permanent remedy for the evil, I shall therefore confine myself to his first question, and enlarge somewhat upon his own answer in which I perfectly concur. He asks, "Where is the cause of the English farmer's distress?" In his cost of production being too great relatively to the Scotch, but more especially with the Irish farmers. He then leaves a wide field open, namely, the proposals of the remedy, upon entering which, I must beg to be acquitted of any charge of presumption, by declaring that I merely stand forward as the advocate of a plan which appeared in your Magazine for July, 1834, and which does not appear to have received that consideration which I humbly conceive it merits. Fearing, lest I should trespass at too great a length on your columns, I will simply refer him to the accounts of corn imported from Ireland, which I would wish him to compare with another statement made by Mr. Montgomery Martin, in his popular work on Ireland, in which he would find "that the increase of exported corn from that country at the intervals of two years each, was for 1821 and 1822, 2,885,899 qrs; in 1831 and 1832, 5,401,040 qrs; and he adds "if these facts be extraordinary, not less so are the exportations to England of live stock:—

|                 |        |         |          |
|-----------------|--------|---------|----------|
| Swine, in 1826, | 73,913 | ; 1832, | 145,917. |
| Sheep, in —,    | 62,929 | —,      | 90,622.  |
| Oxen, in —,     | 57,427 | —,      | 92,000." |

He adds, too, "Now, when we consider that the latter year's statement is for Liverpool alone, and take into account almost the incredible quantity of hams, bacon, salt-beef, pork, eggs, fowl, &c., every *Irishman* who reasons *calmly* on the subject, will admit the incalculable advantage which his country derives from having such a market at hand to stimulate the growth of agricultural produce. But if the proprietor of land in Ireland derives so great an advantage from the English Markets, and which has not been carried to *one-twentieth* part of the extent which the improved and extended tillage will admit, not less would be the advantages to the English manufacturer by

tranquillity and good feeling being established between both countries." This Mr. Montgomery Martin, is an Irishman; a zealous, grateful, patriotic Irishman, but since we Englishmen can reason as *calmly* as our neighbours, let us heed his advice, and derive benefit from the information he gives to *his* countrymen; let us consider what effect this vast importation has had upon this country, and see if it is not the principal cause of our distress at home. It is but a few years since the malt, corn, meat, cheese, &c., used to flow in one steady and continuous stream from this country to the manufacturing districts, and now what is the melancholy fact? Why, instead of our supplying them and taking their goods in return, we could even last year buy Irish Oats, and American Flour in Liverpool, and in consequence of the facility of transport, in Manchester, at prices which would ruin the British farmer; and, sir, we must not forget that this grand alimentary artery is soon to be extended through Birmingham to London, and will, no doubt, have hundreds of branches from it, diffusing its blessings or curses to the farmers of this country as may be, according to our exertions. Irish pork and bacon have been reduced to 2d. or even less per lb. in Manchester, affecting thereby most materially the cheese market. Now sir, allow me to ask, which I do neither in a spirit of pride or invidiousness, which is most likely to be productive of the greatest advantage to the British manufacturer, the consumption of the corn, bacon, &c., grown by the educated comfort-loving English farmer, or that by the potatoe-fed Irishman? nay, I will venture to ask whether it is safe that so great a portion of the people of this country should be dependent for their subsistence (which they shortly must be at present prices) on a country pregnant with riot, rebellion, and so much under the fiat of one great man that he may cause those supplies to be withheld at any time when he thinks it may forward his grand object; the overthrow of protestant England? But how can we feed our manufacturers unless we adopt some cheaper means of cultivation? Can we have duties imposed upon the food which the sister island supplies? Surely in justice we cannot. And I do not apprehend, that if a law for the maintenance of the disabled poor alone, were made for that country, that it would operate very beneficially (and any how remotely) for the farmers of this.

I would beg to refer my "challenger" to Mr. Inglis' valuable Work on Ireland, in which he would see, the style of farmer which we have to compete with; he would there find that they are for the most part occupiers of perhaps half a dozen acres, the produce of which, together with their "*rent* paying pig" they have converted into hard cash in this country, to pay their exorbitant rents, and should they find any surplus remain, that is applied, like dung upon weeds, to increasing the evil by enabling others to set about digging and pigging afresh. Having dwelt perhaps tediously on what I conceive to be the cause of the evil, and the probability of its increase, it remains for me to point out the remedy by which we must overcome at "one fell swoop" this mighty mischief. Let us not deceive ourselves by supposing that the legislature can bestow any sufficient measure of relief, but let us (considering this, if not the sole cause, quite a sufficient one) oppose it by that intelligence, assisted by that wealth which we as a body possess, and so "by opposing end it." Let us form ourselves into societies for the purpose of rewarding any inventors of any locomotive instru-

ments, which will cheapen the cost of agricultural production. The benefits to be derived from such a plan I conceive to be numerous, it would make the farmers to be the great agents in accomplishing the means of their own relief, and their efforts would effect a moral good, which no government could possibly effect. Supposing steam to be the power applied in lieu of horses, as suggested in the Magazine of July, 1834, (which article I confidently recommend to the Herefordshire Farmer, having myself derived from it some hope of a better day to come) how great, how universal will be its advantages; in proof of which I beg to refer to the page preceding his challenges in your Magazine; he will there see what an extraordinary absorption of human labour there was caused by the introduction of machinery in the manufacture of cotton goods, arguing from which we may say that though fewer hands would be wanted to till the acre, the increase of land to be cultivated, (in consequence of the greater consumption by cheaper production) the making the machines, procuring iron, coal, timber, &c., &c., would require the services of such hands to a much greater extent. We may assert too as an axiom, that whatever would tend to cheapen the cultivation of corn, would tend also to the increase; therefore the cheapening of meat, cheese, beer, &c., bearing in mind that the increase of quantity would balance the depreciation. Again, the cheapening the cost of agricultural produce as well as manufactured goods, (which would be another consequence) would extend the circulation, and repair that deficiency in the currency which is so much complained of throughout trade.

As to the practicability of the plan, I must confess that I never entertained any doubt since I first read the suggestion in your Magazine. And I find that the Marquis of Tweeddale has recommended to the Highland Society, to offer a liberal sum for a steam plough that shall prove effective. But sir, I fear that I have far exceeded the limit which you would allow so insufficient an advocate in your valuable columns; the importance of the subject must however be my apology. I hope that the "Herefordshire Farmer" will not take fright at the idea of farmers subscribing; as I feel certain, that were such societies once formed by any public spirited individuals, that they would soon become general, and that, but a very trifling sum would be required of each individual member, which sum, too, need not be paid until the object is attained.

In conclusion, I think that we have no moral right, under existing circumstances, to withhold our encouragement from a plan which presents so many benefits; neither ought we to distrust the practicability of it, when we consider what difficulties have been overcome, what improvements are daily being made, (and when stimulated by general encouragement, how much more rapid will those improvements be,) but above all, when we reflect how highly and peculiarly our land is favoured by that Providence—

"Who uses second means to work his ends."

Near Wrexham, May 8th.

### IMPROVEMENT IN FIRE ARMS.

We beg to state, in the outset of this notice, of a very ingenious invention, that it has no connection with the manslaughter known by the short and emphatic term war. Rude materials and little

skill suffice to construct its cumbrous and massy weapons, but the precision required to bring down a small bird on the wing demands a nice instrument. Ever since we recollect anything about fire arms, it has been a great object with most gunsmiths to improve the lock. A barrel seems easily made, but the lock is a piece of ingenious mechanism. At the instant the eye has obtained the correct direction for the gun, it is required to discharge the piece without changing its direction ever so little. By the old fashion, however, the noise made by the flint striking against the hammer, and the apprehension of the flash, made the hand of the young sportsman unsteady and his aim doubtful. Percussion locks succeeded to the flint and steel, which not only made the instrument more certain and swifter in its operation than before, but they had also the advantage of making it more compact. The gun by that improvement became altogether a lighter and a more easily managed instrument; still there are many things to be desired. The percussion caps are apt to fly off, and not a few accidents have been caused by that. The flash is still an annoyance, the priming caps are exposed to get wet, the cones and hammer are still liable to external injury, and the latter is still a projection in the way of taking aim. The lock, too, by being constructed on a vertical plate, is essentially weak in proportion to the weight of the material employed. All these imperfections have been conquered by a series of ingenious contrivances of Mr. Charles Jones, of Birmingham, whose improved fire-arms are now to be seen at Cockspur-street. The principle of the improvement consists in placing the lock on an horizontal instead of a vertical plate, by which increased strength is obtained with less material and in a less compass. The lock, instead of being applied at the side, is applied at the under part of the stock, and the hammer works in a chamber immediately behind the centre of the barrel. By this contrivance the explosion of the percussion cap takes place within the chamber, and the inconvenience of the flash, as well as the danger of the caps flying off, are entirely obviated. The explosion of the percussion cap is, in fact, now as safe as if it took place within the barrel itself. Instead, too, of the charge being ignited at one side, it is ignited in the centre, and the explosion of the whole of the powder is simultaneous. It is found by experience that the ignition is more complete, the fire more instantaneous and stronger, so that a less charge of powder serves, the shot are impelled with more force, and, what is rather unexpected, the rebound or kicking of the gun is much diminished. The lock, from being completely inclosed, is in no danger from wet, and being much smaller than the common lock, the stock is not cut away so much, and is of superior strength. There are a considerable number of other improvements and advantages obtained by this invention, which are too numerous and minute for description, and which must be seen to be duly appreciated. We recommend all sportsmen to examine Mr. Jones's most ingenious invention. It certainly is not a lock which a backwood's man in the United States could make or repair; on the contrary, it is an instrument of great mechanical ingenuity, which could only be manufactured by workmen as skilful as those of London or Birmingham. To the inventor it has cost much time and many repeated experiments and failures to complete it. Looking at the steps through which he has gone, the invention is one of much complication—looking at the complete instrument and

the results obtained, the contrivance is one of beautiful simplicity. As the ingenious inventor remarked, his lock, like the human arm, accomplishes much by means which are now simple, though obtained after numerous trials and often-repeated experiments.

## ON ROT IN SHEEP.

(From the Quarterly Journal of Agriculture.)

In Vol. V., page 503, of this Journal is an article, entitled "*On water meadows causing Rot in Sheep.*" The very extraordinary circumstances detailed in that communication led me at first to think it an imaginary case, given to the public for the purpose of provoking discussion; as lawyers say, "a case stated for counsel's opinion." But, on farther consideration, I shall treat it as a real one.

The writer says, "About the year 1808, some land, part of which had been under water, much of which was a bog, and part of which was nearly dry, was drained, levelled, and irrigated. Although it was drained, and was so far dry that horses could at all times walk upon it, yet it produced coarse herbage, rushes, and even some flags. In this state it remained at least fifteen years, and during the whole of that time, it was constantly fed on by ewes and lambs in the spring, and no instance was ever known of any of these sheep ever showing the slightest symptom of rot." To this part of the statement, I have to observe, that ewes and lambs are not liable to rot when pastured upon water meadows *in spring*. It would have been satisfactory to have been informed, whether sheep of any kind were *close-pastured* upon the meadow in its then partially improved state, either *in wet summers* or *in autumn*?—and what was the result of such pasturage?

As the reader may not have the published statement to which I allude before him, I will here make a more copious extract from it;—to enable him the better to comprehend the comments I shall have occasion to make upon it. "As, however, the herbage was not good, and it was supposed that, by obtaining a better outfall, and a more effectual mode of drainage, the meadow might be much improved, it was broken up in 1829, drained more perfectly, better levelled, and was again laid down to grass after a turnip fallow. The land then appeared to be perfectly drained. The turnips were excellent, and the grass which was sown in 1831 was beautiful. It was mown that autumn, after having been irrigated, and produced abundantly. It carried great flocks of sheep the ensuing spring, and produced a very great crop of grass early in the summer, but afterwards, in that year, the land appeared starved, and the grass did not come a second time to the scythe.

"In the spring of 1833, the meadow yielded a good pasture to the sheep, but, except in those parts which were dry and steep, it produced little for the scythe. Rushes made their appearance, and as it was probable that the land was not sufficiently drained, more drains were made, which produced a great deal of water. Then for the first time suspicions were raised that the sheep fed on the land were tainted by the rot, and it has been ascertained that, since Christmas 1833, sheep fed upon it have taken the rot in five days. In the spring of 1834 more drains were made in it. The consequence of which has been a great improve-

ment in the quality and quantity of the herbage, but as far as the rot is concerned, it has been equally fatal to every sheep put upon it." It is necessary to add, that although the whole of the meadow is now so well drained, that, after a fortnight's irrigation, it will become so dry in a week, as to admit horses galloping over it without scarcely leaving the print of their shoes; yet as some parts of it are much lower, and consequently much nearer the water by some feet than others, it might be supposed that they would be more likely to produce the rot than those parts which are higher. But this is not the case. It has been ascertained that they are all equally infectious. Other meadows in this neighbourhood, irrigated partly by the same stream, have equally rotted the sheep though perfectly well drained. As those other meadows are entirely new, it cannot be said of them, that there was a time when, though less well drained, they did not rot the sheep. They do not affect the question, *What can be the reason why land which, when less well drained, was fed by sheep with impunity, rots them now, when it is much better drained?*"

This negative question appears to me, as if put for a similar purpose to that of the witty King Charles, in regard to the weight of live and dead salmon, and in answer, I will apply the sentiment expressed by one of the sages on that occasion, "Before I assign a reason, I could wish to prove the fact." On entering upon this discussion, it is but fair to acknowledge I do so under a considerable degree of prejudice; because, I have experience of many instances of low marshy grass land when in a state of nature, or but partially improved, rotting the sheep pastured upon it; and that land, on being subsequently thoroughly drained or connected into well ordered water meadows, did not rot sheep fed upon it in proper season. But I will endeavour to show, from the querist's own statement, it is probable that he has come to an erroneous conclusion in estimating the capability of his water meadow.

1. THE SYSTEM OF IRRIGATION.—The most proper method of irrigating low marshy ground, such as the meadow described, is the bed or ridge system. It is not probable the meadow in question was so formed, because, 'if it had, the occupier would not have ploughed it up, cultivated it, and cropped it with turnips, as the re-formation of these beds with water-carriers and furrow drains, would have been attended with an unnecessary additional expense, of from 10*l* to 20*l* per acre. Indeed, it appears certain, the meadow was not so formed, as he says, "The grass seeds were sown in 1831. They were mown in the autumn of that year *after having been irrigated.*" Now, if water had been thrown over new formed beds of loose cultivated earth, a great part of it would have been washed away, and the young grass plants along with it. Neither is it probable his watering was done upon the catch-work principle, as that is not applicable to flat marshy land, such as a great part of the said meadow is described to be; and a loose formation of catch-work is still more liable to be guttered, and the earth washed away, than beds so formed. I am, therefore, led to believe the irrigation in question was something of the nature of warping, and effected by a rivulet dammed up, and the water from it caused to flow over the meadow at random, or with but little artificial direction; and although ewes and lambs may do well when pastured *in spring* upon land so managed, or rather mismanaged, yet sheep of any sort *close pastured* upon it *in wet summers* or *in au-*

*turnip*, would hardly escape rot, and that, without any reference to whether the land was well or ill drained. The great advantages derived from the bed formations and catch-work system of irrigation, is the rapid flow of water over the surface, and quick delivery of it by the receivers and furrow drains, either to supply other beds at lower levels or convey it to the waste water channels, no water ever being allowed to stagnate upon any part of a well ordered meadow. That desirable object cannot possibly be attained in warped or flooded meadows, however much they may be drained, and hence the liability of such meadows to rot sheep.

2. THE QUALITY OF THE HERBAGE.—We are informed the land was sown with grass seeds in the spring after the turnip crop, and that it was irrigated in the same year the seeds were sown, but the varieties of those seeds are not mentioned. If they were annuals or biennials, such as are commonly used in agriculture, they would of course soon die off, and all the tender and most nutritious of the natural grasses would be extirpated by the aration processes; while the roots of coarse grasses and other pernicious plants, so far from being eradicated, would in fact be renovated by the short course of arable culture. Indeed, it is purposely acknowledged, “rushes again made their appearance in the second year after the seeds were sown,” and probably many other still more objectionable plants made their appearance at the same time. But, even supposing the land had been sown with a proper selection of perennial grasses, these would have been weak in the second year. The narrator complains of his grass looking “starved after mowing in the second year, and that it did not come a second time to the scythe;”—also, in the third year after sowing, he says, “except in those parts which were dry and steep, it produced little for the scythe;”—the more valuable plants raised from seeds sown upon the low land being gone, and supplanted by pernicious plants as before stated. The sound pasturage on the meadow would be confined to a very narrow compass, and hence rot without any reference whatever to draining.

3. THE MANNER OF PASTURING.—We are told that before the meadow was improved otherwise than by irrigation, it did not rot ewes and lambs pastured upon it *in spring*. But, it is not said it was at that time sound pasturage for sheep *in wet summers* or *in autumn*. Neither is it said that *after draining* it rotted ewes and lambs *in spring*. It is, however, stated that after the third draining in the spring of 1834, “the meadow was equally fatal to every sheep put upon it.” There is no mention of the *time of the year* when the sheep were so put, nor is it stated whether the land was *full stocked with sheep* in that fatal pasturage. I, however, think that calamity took place *last autumn*, at least it is fair to infer so, because, as the third draining was effected in the spring of last year, the irrigation could not be carried on while the draining was in hand, consequently too late to produce early spring food; and if the meadow was mown for hay last summer, the fatal result will have arisen from the sheep eating the autumnal lattermath or fog, and not from the land having been more perfectly drained.

Much more matter of a similar purport might be stated in support of my argument, but I trust I have already said sufficient to show that the querist has come to a hasty conclusion in supposing, as he states his case, “that land when less well drained may be fed by sheep with impunity, and

rot them when much better drained.”\* I will therefore dismiss this part of the subject, and add a few practical remarks on that destructive malady.

#### THE ROT IN SHEEP.

Great diversity of opinion exists as to the *cause* of the rot in sheep, but it is generally admitted that the *effect* is an accumulation of flukes on the liver. Some readers may not understand the term “flukes” as here applied, though it is not entirely a local term. I will therefore explain it. On a post-mortem examination of a rotten sheep, a great many small animals, of whatever denomination those creatures may be, are found seated upon the liver; having, without doubt, accelerated the death of the animal. These creatures are called flukes, or flounders, from being shaped something like the fish so named, though they are formed more like turbot than plaice, as they are nearly circular. They vary in size; I have never seen any larger than a man's thumb-nail. They are generally found in the arteries of the gall-bladder; and, in extreme cases, they are also found in abscesses formed on the liver. These creatures move and collapse when first exposed to the air, but soon after die. A question naturally arises, though not easily answered in a satisfactory manner, How come those destructive creatures to be seated upon sheep's livers? and, are they found upon all sheep's livers, whether diseased or not? I do not assert they are found upon the liver of every sheep, but I certainly have frequently seen them, though in small numbers, in the gall-bladder or arteries upon the livers of perfectly sound fat sheep slaughtered by the butcher; but I never saw abscesses and flukes in them upon the livers of such sheep. I have been informed by butchers, that they have found flukes on the livers of fat pigs which they had slaughtered, and I have no reason to doubt that statement. May it not be that flukes, to a limited extent, are placed upon the livers of sheep for a certain purpose in the order of nature, and that they increase in extraordinary numbers when the animal is diseased from other causes, as insects of various sorts multiply upon diseased subjects both in the animal and vegetable creation? If that supposition be admitted, it would then appear flukes on the liver, in an excessive degree, are more the *effect* than the *cause* of the disease called “rot in sheep.” But it has been asserted, and is generally credited by farmers, that flukes on sheep's livers are the sole cause of rot, and that these creatures are not naturally inhabitants of the liver, but originate from eggs or spawn deposited by some insects upon grass growing in marshy places, and taken up by sheep with their food. I do not give a decided opinion upon this theory, whether well or ill founded. It is possible it may be correct, for although food and other matter which the sheep pick up passes into the stomach in the first instance, and apparently does not come into contact with the liver, yet, as there is a communication from the liver and gall-bladder to the stomach, for the purpose of conveying matter necessary to promote digestion, the embryo of the fluke insect may ascend by that channel from the stomach to the liver. It may then be said “insects whose natural element is in the air or upon the earth, will not live in the interior of animals.”

\* We believe it to be truth that should grass be pastured by sheep after being irrigated in *winter* no rot will ensue, in so far as the irrigation is concerned; but that grass produced *after summer* irrigation will cause the rot in sheep, how well soever the land may have been previously drained.—EDITOR.

One instance to the contrary, well known to farmers, will suffice to answer that objection. That is, the case of the bot-fly. That insect so deposits its eggs, that maggots are bred from them in the entrails of horses. These maggots afterwards pass into their chrysalis state, and ultimately become flies. Such is the order of nature in that case and in many others, and why not in regard to the fluke insect? It is probable the natural history of the fluke insect has been ascertained, though I am not acquainted with it; but that is of minor importance to the practical farmer; his objects are, to know how to prevent his sheep taking rot, and how to cure them when affected with it. To these desirable objects my attention will now be directed, and although I have no new theory to promulgate, yet as the observations I shall make on the subject are derived from extensive practice and many years' experience, they may now prove interesting, if not useful, to some practical men into whose hands this essay may fall.

I need not describe the symptoms of rot in sheep; these are unfortunately but too generally known to flock masters and shepherds. It does not necessarily follow, as some persons have imagined, that all sheep tainted with rot die of that disease; on the contrary, very many tainted sheep, *when properly treated*, afterwards become so far sound as to fatten well and be not only profitable to the owner, but their mutton of a good colour and wholesome to the consumer; so much so, that it is impossible for any person, from seeing and tasting the mutton, to decide whether the sheep had ever been tainted with rot. In curing the rot, I do not think it advisable to trust to the effect of medicine alone. I have made use of the customary remedies of turpentine, vitriol, nitre, ginger, &c. and have derived some benefit from these medicines, but only to a very limited extent as compared with a change of pasture. I consider it of the greatest importance, on the first symptom of rot in the flock, to give the whole, wherever practical, an immediate change of pasture, and that of a quality such as I shall describe in a case of my own. I several times had different lots of store wedder sheep bought in, in spring, for the purpose of summer grazing. These sheep had been bred and reared upon waste land fed in common. They appeared sound when purchased, but afterwards I had reason to believe they were tainted with rot. I gave them no medicine whatever, but turned them into a dry, hilly, well-sheltered old-grass pasture, where they had a wide range and abundant choice of food, the pasture not having been generally stocked with sheep, and not close eaten by other stock. These sheep thrived well, and made themselves prime fat in the course of the summer. They returned a good profit on their grazing, and, when slaughtered, proved to the butcher's entire satisfaction. Their mutton was firm, and of a fine bright colour. As they were slaughtered in the neighbourhood, I had frequent opportunities of inspecting their livers, and made it a point of doing so at every favourable opportunity. My anticipation of their having been tainted with rot proved well founded. In every case that came under my observation, I found the liver much reduced in size, the lobes of some quite wasted away. Numerous abscesses had been formed on most of the livers, but they were all healed and cicatrized, and the remains of the livers were firm to the touch, and had a healthy appearance. I found flukes in the gall-bladder arteries, but not in greater numbers than I have seen on the livers of other fat sheep not tainted with rot. It is to be observed

these instances were not confined to sheep drawn from the same flock, or to one particular season. The results were, as I have stated, upon sheep drawn from various flocks, and in different years. It is also proper to mention, I had no particular loss in those sheep, not more than the customary casualties in grazing sheep. It is true comparatively few farmers and graziers have such favourable opportunities of changing their sheep's pasture as I had in the instances I have here mentioned; but it is in the power of all to stock their land lightly, and it is generally admitted that overstocking land with sheep is one principal cause of their contracting rot. Sheep are taught by instinct to reject unwholesome food, nor will they resort to it otherwise than when pinched by over-pasture, or confined in situations where they have no other resource. It is a sound maxim in grazing, "*rather under-stock than over-stock land.*" There are many instances of farmers who, having for a series of years kept a limited number of sheep upon their lands without rot in their flocks, and who, afterwards, on increasing their stock beyond a due proportion, sustained serious loss by that disease; and again, on their reducing their flocks to their original standard, the rot ceased. Such instances were not confined to low-lying swampy land; similar results have been experienced from like management, upon dry hilly land; for, even in such situations, there are always some swampy places producing unwholesome herbage, to which sheep resort when pinched of better food. I will mention a particular instance of this. A farmer whose farm consisted, in part, of a considerable extent of arable land, and adjoining to it a dry hilly sheep pasture, which he stocked rather hard. In a hollow place of that pasture was a swampy pond, which was preserved in that state for the purpose of supplying the water-wheel of the thrashing machine. The farmer had occasional losses from rot in his flock. He fenced in the pond, and prevented the sheep having access to the coarse herbage which grew on its verge, and then the rot entirely ceased.

Great precaution should be taken, particularly in *wet summers* and in *autumn*, when sheep are pastured upon low-lying cold clay, thin skinned land. Such land should never be close pastured with sheep, nor should they ever be close confined either upon such land or upon any other description which is not inaptly called "*rotting land*," that includes warped, flooded, and marshy land generally. When sheep are necessarily pastured upon such land, they should always have access, at pleasure, to healthy sound land adjoining, which they will naturally select for a night lair, and for pasture in unseasonable weather. Sheep are liable to contract colds when compelled to lie upon damp unwholesome ground in wet seasons; also from autumnal fogs, when confined to such situations; and, colds so contracted, not unfrequently terminate in rot.

Sheep are not so subject to rot upon the high bleak mountains in the north, as upon the fertile plains in the south of the island. This has been fully exemplified of late years, and may be accounted for by the hills in the north being seldom overstocked; the sheep upon them have wide ranges of pasture, and instinct teaches them to select proper food and a dry lair. While in the south, the land being more valuable, is divided into smaller occupations, is generally closer fed, and the sheep being confined in narrower limits, have not so great a variety in choice of food, and of lair suitable to change of wind and weather.

Shelter they more generally have in the south than in the north, but that shelter frequently confines them in a damp foggy, pestilential air.

The writer of the essay which has caused this discussion in speaking of his meadow, says, "It has been ascertained that sheep fed upon it since Christmas 1833, have taken the rot in *five days*." I have heard it said sheep have been known to take the rot from pasturing upon rotting land only a few hours, and that may be the case, for sheep, when hungry, on being turned into fresh pasture, feed voraciously, and without discrimination in the selection of their food; they are then liable to pick up unwholesome even poisonous herbage; and if the fluke theory which I have mentioned holds good, they would also be liable to pick up the embryo of that destructive insect.

Salt is a good condiment for sheep, and they eat it with avidity when accustomed to it. Hence, marshes occasionally over-flowed by the sea, or as they are called "salt marshes," are not so liable to rot sheep, as land warped or flooded by fresh water. It may be that salt destroys the embryo of the fluke insect, or prevents its deposition on the grass. It no doubt is a corrective to unwholesome food.

When a few sheep only are pastured along with other stock upon dangerous land, they are not so liable to take rot as when such land is close pastured by sheep alone, because the few have a greater choice of food suitable for them. For that reason, it is advisable to pasture in autumn with mixed stock in preference to sheep alone, water meadows, warped or flooded land, and all other descriptions of dangerous land. And, most assuredly, *the lighter such land is pastured with sheep at improper seasons, the less danger of rot.* To conclude, it may be said in this case, as in most others, —prevention is better than cure. And I do believe rot in sheep may, in very many cases, be not say in all, be prevented by due care and attention in the grazier or shepherd. The means of prevention which I have here pointed out are not infallible, but assuredly such persons as adopt these precautionary measures will find it their interest in so doing. F. B.

## SWEDE TURNIPS.

TO THE EDITOR OF THE HEREFORD TIMES.

Sir,—Having often noticed in your valuable columns useful remarks on agriculture, I beg leave (if you think them worthy of insertion) to offer the following on preparing for the growth and cultivation of Swede turnips, as loss and expense might be avoided by too often sowing and failure.

In May, work the soil well into mould, and put on a good dressing of dung, but not too rotten, plough it in quick, and break it fine on the surface, it will then ferment and give carbon to the soil for the better support of the artificial vegetable, and, by making the soil well into mould, will cause all natural vegetables to vegetate and exist so as, by two or three repeated ploughings, can be eradicated and destroyed, and better made ready for the artificial crop.

It would be much better, during this month and the first week in the next, to prepare and put on some well-made compost, from fifty to sixty cart-loads to an acre, consisting of the head-ridge soils, with dung, ashes, tan, or any refuse, with lime, well pulverized two or three times with the plough

and harrow, so as to avoid manual labour; put it on after the dung is ploughed in. This expense will be found to answer in the following crops:—turnips, barley, seeds, and wheat; the most profitable crop, the seed, will be the better, and support more of those valuable animals, the sheep, the ace of trumps in farming.

"To every thing there is a season."

The time best for planting is between the eighth and twentieth of June; if planted sooner the turnip is more inclined for seed, which injures the bulbous root, and grows with a stalk or handle instead of leaves.

The ridge drilling is the best from twenty to twenty-seven inches wide, to allow a horse power for hoeing; one furrow is the surest to cause the seed to vegetate; if you draw two, or make a cop, the plough-share drives the top dry soil together, and you deposit the seed therein, which cannot vegetate till rain comes; avoid putting the seed too deep, as it might rest below the powers of oxygen, and remain in a torpid state, then the crop fails.

Having from long experience pursued the above system, which is better known in turnip counties, I can say after our great leader, Mr. Coke, of Holkham, the crop never fails. Information of any sort is useful, and as a true motto:—

"Tis to the pen and press we mortals owe,  
All we believe, and almost all we know."

I remain, Sir, your obedient servant.

T. BLUCK.

Dinedor, May 15th, 1835.

## ISLINGTON CATTLE MARKET.

TO THE EDITOR OF THE "COURIER."

Sir,—Knowing that your valuable columns are ever open to give publicity to any business that affects the community at large, allow me to draw your attention to the Islington Cattle Market.

It appears to me that no private bill has, for many years, been brought into Parliament, of more importance to the grazier, the farmer, and the consumer, than the one for the establishment of the new market at Islington, now before the House of Lords. Various reports are in circulation that the tolls to be enforced at the new market will be more than are now paid at Smithfield. I have, however, carefully perused the clauses and schedule of the tolls, as the bill was passed by the House of Commons, and I can assure you and the public, that the actual amount to be paid is, in no case, more than is now paid at Smithfield, and, in one instance, that of horses, *considerably less*. In fact, the grazier's expenses will not be increased, although they will have very superior accommodation. It is sincerely to be hoped, therefore, that the House of Lords will come to the same conclusion and give their sanction to the bill, as it will confer so many and lasting benefits on the agricultural community and all the friends of humanity, as well as the public at large.

A FRIEND TO IMPROVEMENT.

June 5th, 1835.

SMITHFIELD TO WIT:—Notice is hereby given that the Worshipful Corporation of Butchers in their Hall assembled have resolved, and do resolve as follows:—

*Firstly*,—That Earl Spencer, late Lord Althorp, highly-eminent-fat-bullock-grower though he be, is not a Lord to be depended upon—inasmuch as by his unaccountable absence from his duty in the House of Lords he has allowed that rascally, wicked, and never

half-enough-to-be-vituperated Islington Market Bill to progress through a second reading, when it must be well known to his Lordship that should the said Bill pass into a law, it will put an end for ever to the conglomeration of cattle in the heart of the city, and that consequently the citizens will be deprived of the wholesome excitement occasioned by the sight of half-strangled oxen dying of thirst, the bellowing of bullocks, and yelling of drovers; the salubrious smells arising from the city cellar-hole slaughter dens; and many other delights which the said citizens have hitherto enjoyed in full swing.

**RESOLVED, Secondly,**—That Lord Althorp, now Earl Spencer, be no longer considered, as heretofore, "the Butchers' Friend;" but that his Lordship will please to consider himself henceforth completely cut by the Worshipful Company of Butchers, who hereby recommend to all the gentlemen in the trade never again to handle a bullock fattened by his Lordship.

**RESOLVED, Thirdly,**—That the Earl of Hillsborough be requested to step into Lord Althorp's shoes as the friend and patron of the metropolitan butchers; and that the said Earl of Hillsborough be requested to adopt as his crest, a beef-axe proper;—the said Earl having by much and laborious practice perfected himself in the use of that noble instrument.

**RESOLVED, Fourthly,**—That, in order to punish an ungrateful public for sitting quietly by whilst so iniquitous a Bill is passing through Parliament, all the butchers' boys are hereby authorised to ride or drive about the streets more furiously and alarmingly than heretofore; and if that is not possible they are hereby requested so to ride as to accidentally upset more old women and children than usual.

**RESOLVED, Fifthly and Lastly,**—That the thanks of the Worshipful Corporation of Butchers is most justly due to Mr. Deputy Hicks, and Mr. Alderman Pryme Lucas, for their endeavours to perpetuate and confine the slaughtering trade in the heart of the city of London; and that in return for their services, a band of marrow-bones and cleavers be ordered to attend gratuitously at all the dinner and evening parties which hereafter may be given by Mr. Deputy Hicks, and that arrangements be forthwith made for enabling Mr. Alderman Pryme Lucas to regale his ocular and olfactory nerves every morning with the pleasing sight and uncooked odours of a very recent killed ox pluck.

## HINTS CONCERNING BEES.

These little industrious insects deserve much more attention than they usually receive. Where persons take delight in them, and are void of that fear which renders the care that is due to them an irksome task, bees may be made a very profitable article of the domestic economy.

We do not affect to enter upon the question of policy as to the mode of taking the honey; the reader who is interested in it should carefully peruse that inestimable book, "The Honey Bee," by Dr. Bevan, and compare his preservative practice with that of Mr. Nutt, who, without destroying a stock, or permitting it ever to swarm, appears to collect unprecedented quantities of superior honey. We heartily desire to see the practice of either of these Apiarians supersede that of the cottager or ordinary bee-master. Our intention is simply to impress upon every one who wishes that his bees may produce *early and strong swarms*, the necessity of feeding the insects during the whole of a mild winter; and, above all, at the present season. If honey be in superabundance, it is the best aliment wherewith to sustain the bee; but, in the absence of this most natural food, a good substitute may be prepared by mixing half a pound of good moist sugar with a teaspoonful of pure home-brewed mild ale, and as much water, and simmer the whole till a strong syrup be formed; a small teaspoonful of salt may be added, perhaps, with advantage. Small troughs, made of an elder branch, cut in half, and cleared of the pith, are

very convenient vessels to contain the food, provided they be cut at the joints, so that each end be closed.

The troughs should be filled and placed near the mouths of the hives whenever a warm gleam invites the bees to be on the alert; it is calculated that one pound of sugar will supply a hive of bees for a month from October to January; but that double the quantity will be required from February till the middle or end of April. Whatever the bees imbibe is not lost, for if they do not consume and digest the whole for their own immediate sustenance, they will convert the surplus into honey, and deposite it in the honey-cells; but if hunger impel them to appropriate as food all that they are supplied with, the vigour of the insects will be thus maintained, and remuneration will be found in the early productiveness of swarms.

We beg to caution every keeper of bees against the hazardous experiment of inducing a forced sleep or torpor, by burying the hives, or keeping them in cold cellars, during winter. We recently were informed by a respectable lady, that she once knew a whole stock to be destroyed by placing the hives in a cellar. The bees were quiet during the winter, but when the hives were examined in the spring, they were all dead and mouldy. In Russia, Poland, &c., where the bees form their own abodes, they perish not with cold. Here, where our fitful climate exposes them to continual reactions, the bees ought to be fed whenever they are in activity. All is safe while frost produces torpor.

## ON THE USE OF RAPE AS A GREEN CROP.

(From the Irish Farmer's Magazine.)

BY MR. G. F. RUSSELL.

Your having thought my paper on the planting of rape worthy of a place in your Journal of December last, has encouraged me to forward the annexed account of the usefulness of rape as a green crop.

As I mentioned in my last, I transplanted my plants from a seed-bed into a field of oat-stubble, in the month of September, at one foot a-part. At the latter end of November I began to pull out every second plant, (they were well grown and juicy)—this I continued to have done till January—my cows being fed on it daily. I then began to mow that which was first thinned; six square yards cut in that way produced as much food as a cow could eat in twenty-four hours. Thus I had the richest green food during the months of January, February, and March. Since then I have been cutting the second crop, which is still better than the first, having the flower, of which the cattle are extremely fond; and as it is cut the stalks are pulled and burned, leaving the space for potatoes in drills, which I have been planting from the first of April to this date.

One advantage of rape is, that it smothers weeds: my ground was very dirty, and is now much cleaner. The young sprouts of the second crop make delicious greens for table during the winter months: many persons prefer them to any other. My cows milk extremely well on it, and the batter is both abundant and particularly well flavoured. I have one cow that has been milking well for the last twenty months; she and all my others have been stall-fed almost entirely upon rape during that time. They are only put out into a paddock two or three times a week, for an hour or two at a time, and they are at this moment in excellent condition. By stall-feeding them in this manner I have raised an immense quantity of manure of the finest description, which has enabled me to sow mangold wurtzel, plant potatoes, and top-dress my meadows.

Croney-horn, Carnew, 25th April, 1835.

## FOR THE EDITOR OF THE SUSSEX ADVERTISER.

Sir,—In England, winter and summer, people sleep on feather beds; this is well in cold weather, but in hot, bed made of oat chaff is infinitely preferable;—it is cool, soft, and agreeable. The chaff should be changed once a year. In the southern parts of Europe, the leaves of maize or Indian corn are used for this purpose; they are of course not so soft as chaff, yet they make a very good bed: I slept on one in the island of Terceira.

It seems to me, that there is not attention enough paid to the means of preserving of health during the summer. An eminent Scotch physician says that there is not a more wholesome beverage than butter milk; about half a pint of it should be taken an hour before breakfast and dinner; indeed it would be still better to make a breakfast of it with bread.

In France, a breakfast is often made of ripe fruit and bread *framagmon*, i. e., soft cheese, is found at the best tables; the manner of making it is this—turn a quantity of new milk with rennet, pour off the whey and put the thick part into little wicker baskets, five inches square and three deep; and of which the osiers should be a quarter of an inch asunder. The bottom should be of split osier, half an inch wide, with like intervals. Leave the cheese a day and a half to drain off the rest of the whey. Beat it up with cream or milk to the consistence of a hasty-pudding; add sugar and nutmeg to your taste; let it be served up decorated with flowers round the bowl, and if you don't like the taste of it give it to somebody that does.

I am, Sir, your obdnt. Servant,

Cliffe, Lewes,  
1st June, 1835.

GEO. HARDS.

## CULTIVATION OF ASPARAGUS.

TO THE EDITOR OF THE PERTSHIRE COURIER.

Sir,—Observing in your paper lately a paragraph relative to the successful treatment of Asparagus, I hope you will give a place to the following remarks in your useful paper, which I find generally read among my class, asparagus being one of the most delicate and wholesome culinary vegetables we have in the early part of summer, and always in general request. I do not here mean to enter into the minutiae of the sowing, dressing, &c., of the plant, as every one who grows it knows, or, at least, ought to know these particulars. — I merely intend to give a short detail of the success I have experienced from the following method:—

In the beginning of the cutting season, (which generally takes place in the latter end of April, or in later soils, the second week of May) in the year 1827, and more particularly in 1828, my Asparagus appeared to come up uncommonly weak, when I found upon examination, that the tender tops were all eat with slugs, as soon as they appeared above ground. Such was the havoc, that I had not a dish worth sending to the kitchen before the first or second week of June, when the dry weather assisted in keeping them under. I had recourse to repeated dustings of lime, but to no effect, for the first soft or dewy morning slacked the lime and rendered it too mild to produce any check. I then tried them with salt, the bane of slugs, and found in it an effectual remedy. In the early part of the last season, I had my beds all salted (above the winter dressing,) allowing a pound to about four square yards, as I prefer salting before the cutting season begins: previous to this,

during the winter, I let the beds have a liberal allowance of the drainings from the dunghill, the result of this was that my Asparagus was much superior and better than in former years.

Asparagus is known to be indigenuous on the seashores of England, and from the circumstance of its proximity to that marine coast, induces me to attribute the improvement in size of the shoots, to the salt aided by the juices of the liquid manure: it is cultivated in many varieties of soil. I know of some gardens, however, where it does not thrive, of course I would highly recommend a light sprinkling of salt, and repeat the sprinklings on the new sown beds, as I am inclined to think, from the sweetness of the young tender shoots, that the slugs devour them as they come up, and it must be allowed that when the young buds are once destroyed, nothing remains to form a stem either for cutting, or elaborating sap to perpetuate, and preserve the roots.

I am not aware of any thing having been written in any of the recent horticultural publications on this subject, as from the high prices of these productions, it is beyond the power of the limited incomes of many of my professional brethren in this northern latitude, to keep pace with our neighbours in more lucrative situations, and this may be one reason why so few of us know what is immediately going on in the southern hemisphere of horticulture.

I am, &c.

A KITCHEN GARDENER.

## ON THE CURE OR PREVENTATIVE OF THE BLACK LEG IN CATTLE.

(From the Irish Farmer's Magazine.)

Gentlemen,—Seeing in your Sixteenth number, (Vol. II. p. 84), queries from Mr. Edward Carroll, on that fatal and deadly disease so well known by the name of the black leg in cattle: now the thanks of the public should be due to Mr. Carroll, as through him and "The Irish Farmer's and Gardener's Magazine," the question is likely to be brought to light.

The following is a sure preventative when performed before the disease commences, and so simple and easy, that any handy person can do it:—Take of Rue, one handful; Savin, one handful; and a few cloves of Garlic; pound them well together until you could squeeze the moisture out of them; then have your young stock brought in and held; get a sharp knife, and take hold of the tail with your fingers, turning back the hair from the top of the tail, that you may see where to cut; then, with your knife, split the tail about one inch, or half an inch, upwards, until the blood exudes freely; then, with your finger and thumb, put some of your pounded Savin, Garlic, and Rue, into the incision or cut; knot the hair, or tie it with a bit of twine, and the work is done; or you may put it into the neck—anywhere it circulates through the blood will do. The quantity of Rue, Garlic, and Savin, can be in proportion to the number of young stock to be done. This is a very old method, and I have practised it these twenty years, and never knew one to die of the Black Leg after the cure being performed twenty-four hours.

DANIEL RYAN.

Woodville, Templemore.

## COURT OF KING'S BENCH.

THE KING v. THE JUSTICES OF CARNARVON.

MR. ARCHBOLD moved for a *mandamus* to issue to the Justices of Carnarvon, commanding them to hear the application of certain overseers re-

specting the liability of a putative father to support a bastard child. In this case the woman had been delivered of the child in November, but did not become chargeable at the time. She did, however, become chargeable shortly afterwards, and then the overseers applied to the justices for an order on the putative father. The application was not made in the January sessions, but in the Easter sessions, when one of the justices said that the application was too late, for that the Act had said that the overseer should make the application at the sessions next after the birth of the child, and the justices refused the application. The question depended on the construction of two clauses of the Poor-law Amendment Act, 4 and 5 William IV., c. 76, s. 72 and 73. By the first of these clauses it was enacted, "That when any child shall hereafter be born a bastard, and shall by reason of the inability of the mother of such child to provide for its maintenance become chargeable to any parish, the overseers or guardians of such parish, or the guardians of any union in which such parish may be situate, may, if they think proper, after diligent inquiry as to the father of such child, apply to the next General Quarter Sessions of the Peace within the jurisdiction of which such parish or union shall be situate, after such child shall have become chargeable, for an order upon the person whom they shall charge with being the putative father of such child, to reimburse such parish or union for its maintenance and support." The second clause showed that such a limitation of the right to make the application had not been enforced by Legislature, for in the 73d section it was said—"Provided always, that whenever such application shall be heard, the costs of the maintenance of such bastard child shall, in case the Court shall think fit to make an order thereon, be calculated from the birth of such bastard child, if such birth shall have taken place within six calendar months previously to such application being heard; but if such birth shall have taken place more than six calendar months previously to such application being heard, then from the day of the commencement of six calendar months next preceding the hearing of such application." The reference to six calendar months showed that the overseer was not peremptorily bound to make the application within six months.

Mr. Justice PATTESON : And yet the first section appears to be positive.

The COURT granted rule to show cause.

#### ILFORD PETTY SESSIONS, MAY 30. FRAUDULENTLY IMPOUNDING CATTLE.

A practice which has of late been carried to such an extent as to be not only a great annoyance but a loss to the farmers in the neighbourhood of Ilford, Wanstead, and adjoining parishes, was to-day brought under the consideration of the Bench. Mr. Page, the keeper of the manor pound, and Mr. Blackstone, of Cann Hall, Wanstead, appeared before the magistrates, and the latter gentleman stated that he had to complain of the manner in which his cattle were impounded : they were constantly driven to the pound by a set of idle vagabonds, for the purpose of getting the fine of 1s in order to procure drink, and though he did not object to the fees of the pound-keeper, he did to the payment of this sum.—The Chairman : I am afraid your only remedy is by law. If a man's cattle are impounded, and he wishes to contest the right, he must replevy and apply to the civil law.—Mr.

Blackstone : I wish to know from the Bench whether these fellows have a right to do this?—The Chairman : The Lord of the Manor has a right if they are infringing on his property ; but in the forest some persons have the right, under certain restrictions, such as being marked by the proper steward, to turn cattle on.—Mr. Blackstone : We have that right, and the cattle were properly market, but they are driven from the forest into the lanes, and then these fellows take them to the pound to get the fine.—The Chairman : I should say no individual has a right to impound them unless they are infringing on his rights and property.—Mr. Fanshawe : But Mr. Blackstone states that these idle fellows first drive them into the lanes, their object being to take them to the pound to get the fine and procure drink.—Mr. Blackstone : This is the case, and I can give you another instance ; last Thursday I was looking for my cattle, when Mr. Glenny sent me word he had got them, having taken them from two men who were driving them to the pound. A boy had been keeping cows in the forest, and when he went home he took mine off with them ; they were left in the road, and had it not been for Mr. Glenny, would have been put in the pound.—The Chairman : If they are in the road the surveyor has a right to impound them.—Mr. Blackstone : We submit that the surveyor has a right, but not these men.—Mr. Dare : There is a broad distinction between the cattle being on the turnpike-road, and those taken from the parish highway. In the former case the law distinctly states that any person finding them on such road may take them to the pound, and that the sum paid on them shall be so much per head, together with all reasonable expenses ; and it is further provided that if the fine is not paid on them, the cattle shall be sold, and the residue of the proceeds accounted for and restored to the owner. Now, on a common parish highway, as has been stated by the Chairman, if your cattle are impounded, the mode is to replevy, and try the cause by action at law. As regards this individual (Mr. Page), I should say it is not for him to determine whether the cattle have been wrongfully or rightfully taken up ; it is enough *prima facie* for him, if a person bring the cattle and says they have strayed, to take them into the pound, and when once there, you must pay certain dues before you can get them out—so much per head I believe. But as a matter of advice, in case cattle were taken there in this way, I should resist paying the individuals who had carried them, because the law does not give them anything. In the other case the law is distinct.—Chairman : If a person charges you so much for damage done to his property, you must replevy and try the question ; but if a person who drives them to the pound has no property to damage, you have, I think, a remedy against him for trespass, either here or at the Quarter Session.—Mr. Dare : The distinction is not known to these parties. They know the law does give something for taking the cattle to the pound, and they think it is applicable to all cases, and that they have a right to have something for their trouble. Not knowing the distinction, they take the cattle off the parish highway. It is right, however, that these persons should know it, for some of them actually get a living by it. I should certainly resist it ; I would pay the pound-due, but I would pay no more, unless it were proved to me on oath in a legal way, that the cattle were on the turnpike road.—Mr. Blackstone said he would adopt this course, and thanking the magistrates for their advice, retired.

## THE CHELMSFORD AND ESSEX AGRICULTURAL SOCIETY.

On Tuesday, June 16, the town of Chelmsford was enlivened by the holding of the Annual Spring Meeting of this Society, in the High-street. The wool, stock, &c., were exhibited on the assigned spots, and the attendance of dealers and farmers was very considerable. The following are the particulars of the show, and adjudication. Each pen was numbered.

### LONG-WOOL RAMS.

1. Mr. Wm. Steele, a Shearling Long-wool Ram.
2. Mr. Stephen Bridge, a Long-wool Ram Tag (2nd Prize, 1*l.* 1*s.*)
3. Mr. Henry Cleve, Long-wool Ram.
4. Mrs. Douglas, Leicester Ram (1 year.)
5. Ditto ditto (2 years.)
6. Ditto ditto (3 years.)
7. Mr. Wm. Gale, Long-wool Kent Ram.
1. Mr. W. Fisher Hobbs, Halsted, Long-wool Ram (1st Prize, 2*l.* 2*s.*)
9. Mr. Thomas Bridge, Long-wool Ram Hogget.

### DOWN RAMS.

1. Mr. Isaac Belcher, Danbury, Hogget Ram (1st Prize, 2*l.* 2*s.*)
2. Mr. Wm. Hobbs, South Down Tup.
3. T. W. Bramston, Esq., Skreens, M. P., Down Ram (2nd Prize, 1*l.* 1*s.*)

### LONG-WOOL HOGGETS.

1. Mr. Cleve, 4 Long-wool Ewe Hoggets (2nd Prize, 1*l.* 1*s.*)
  2. Mrs. Douglas, 4 Leicester Ewe Hoggets.
  3. Mr. W. Gale, 4 Long-wool Kent Ewe Hoggets.
  4. Mr. Hobbs, 4 Long-wool Ewe Hoggets (1st Prize, 2*l.* 2*s.*)
  5. Mr. T. Bridge ditto.
  6. C. T. Tower, Esq., 4 Long-wool Ewe Hoggets.
- These being Merinos were not classed, but they were greatly admired.

### DOWN HOGGETS.

Mr. Bramston, 4 Ewe Hoggets (Prize, 2*l.* 2*s.*)

### SHEEP SHEARERS.

1. Thomas Bloss, recommended by Mr. Isaac Belcher.
2. Joseph Patch, ditto ditto.
3. Richard Jarvis, ditto Mr. T. W. Crooks.
- (1st Prize, 1*l.* 1*s.*)
4. — Hurrell, ditto Mr. Cleve.
5. — ditto Mr. T. W. Crooks,
6. — ditto Mr. M. Gale.
7. Wm. Neale, ditto Mr. T. Bridge (3rd Prize, 5*s.*)
8. — Kemp, ditto Mr. Hobbs, (2nd Prize, 10*s.* 6*d.*)

### DOWN FLEETS.

Mr. Cleve (Prize, 1*l.* 1*s.*) Mr. Belcher, Mr. S. Bridge, Mr. W. Steele, Mr. Gale, Mr. Hobbs (Prize, 1*l.* 1*s.*) Mr. T. Bridge, and Mr. Bramston.

### BULLS.

- Mr. Isaac Blyth, a Two-year-old Bull (Prize, 2*l.* 2*s.*)
1. Mr. Crooks, a Yearling Durham Bull.
2. Mr. Baker, ditto.
3. Sir J. T. Tyrell, Part., M. P., a Yearling Short-horn.
4. Mr. Bramston, a Yearling (Prize, 1*l.* 10*s.*)

### TWO-YEAR-OLD HEIFERS.

1. Mr. Crooks, a Durham (Prize, 1*l.* 10*s.*)
2. Mr. T. Dowson, a Short-horn.
3. Mr. T. Bridge, one.

### YEARLING HEIFERS.

1. Mr. Crooks, Durham (Prize, 1*l.* 10*s.*)
2. Mr. John Perry, ditto.
3. Mr. J. Blyth, one.
4. Mr. Bramston, one.

### HORSES.

1. Mr. W. Simmons, Cart Stallion, Briton.
2. Ditto ditto Heart of Oak, (2nd Prize, 2*l.* 2*s.*)
3. Mr. J. Upson, Suffolk Stallion (1st Prize, 3*l.* 3*s.*)

### MARES.

1. Mr. W. Simmons, Violet.
2. Ditto, Diamond.
3. Mr. W. Wright, Cart Mare (2nd Prize, 1*l.* 1*s.*)
4. Mr. W. Seabrook, ditto (1st Prize, 2*l.* 2*s.*)
5. Ditto, ditto.

### COWS.

1. Mr. T. Dowson, Short-horned.
2. Mr. Baker, Writtle, one (Prize, 1*l.* 10*s.*)

### SWINE.

1. Sir J. Tyrell, a Neapolitan Boar (Prize, 1*l.* 1*s.*)
2. Mr. Milburn, a Sussex Boar (Prize, 1*l.* 1*s.*)
3. Mr. Hobbs, a Boar.
4. Mr. C. T. Tower, a Boar.

### SOWS.

1. Sir J. Tyrell, a Neapolitan (Prize, 1*l.* 1*s.*)
2. Mr. Hobbs, a Sow.
3. Mr. Baker, ditto.

The shearing of the sheep took place in the High-street, and excited much interest. Several agricultural machines were produced.

The Judges were, for *Sheep and Shearers*, Mr. T. Seabrook, Mr. James Christy, and Mr. C. Matson. For *Wool*, Mr. T. Johns, Mr. Oram, and Mr. Unwin, jun. For *Stock*, Mr. C. C. Parker, Mr. W. Pavitt, and Mr. John Buttle. For *Horses*, Mr. R. Baker, Mr. Dowsett, Mr. John Smith, and Mr. W. Crush. For *Swine*, Mr. T. Bridge, Mr. Matthew Mason, and Mr. T. W. Crooks.

Among the wool buyers were Mr. Oram, of Fyfield; Mr. Johns, of Chelmsford; Mr. Stephen Unwin, jun., of Coggeshall; Mr. Matthews, of Witham; Mr. Page, of Manningtree; Mr. Hammond, of London; and Mr. Turner, from Downham, in Suffolk.

On this occasion the Shire Hall in the Market Place was used for the first time.

### THE DINNER.

At half-past three o'clock, about 116 gentlemen sat down to dinner at the Saracen's Head Inn. Many more would have joined the party, but could not find room. John Disney, Esq. (the President of the Society, was in the Chair, and Thomas Blewitt, Esq. filled the office of Deputy Chairman.

The cloth having been removed,

The CHAIRMAN gave "The King," and "The Queen, and the rest of the Royal Family," which toasts were severally drank with cheers.

The CHAIRMAN then said that though this Society had been in existence only a year, it had increased in numbers and in its objects, and he trusted it would continue to do so. A Wool Fair had been established, which had called them together this day, and the Secretary would read the report of the progress and present state of the Society, which the Committee had the honour to offer for the consideration, and he hoped, for the adoption of the meeting. (*Cheers.*) The Committee met a few days ago, and they found that the Society was getting better known, and that its objects were gaining ground. He then proposed as a toast, "Prosperity to the Chelmsford and Essex Agricultural Society." (*Cheers.*)

The Secretary (H. S. Gilson, Esq.) then read the following report:—

### FIRST REPORT OF THE COMMITTEE.

On entering the second year of the existence of this Society, your Committee feel themselves called upon to give a short report of their proceedings, and at once to express the satisfaction they feel in pro-

nouncing the Society in a promising and improving condition, and at the same time to acknowledge the obligation they are under for the assistance and good feeling so generally evinced by the members of the Society.

Your Committee feel the deepest regret in being compelled to notice the still suffering state of the Agricultural interest, and beg most seriously to recommend that the Society may not in any way relax in their exertions to procure some speedy and substantial relief.

Your Committee are confident, if the original intentions of the Society are steadily persevered in, namely, the encouragement of the labouring classes—the improvement in the breed of stock in Essex—and the cultivation of the soil, much good must ultimately result; but that the assistance of the Legislature in redressing your real grievances is most essentially necessary, without which they despair of ever seeing a remunerating and fair price given for the produce of the land.

Your Committee, in conjunction with the members at a General Meeting, considered it expedient to hold an Annual Meeting for the show of Breeding Stock, and Sale of Wool, and from the reports already received, have reason to believe much benefit will arise therefrom.

Your Committee recommend four district Ploughing Matches should be held in the ensuing Autumn, instead of two, as in the last year; and that in each district a Class should be made for boys under 18 years of age: this, in their opinion, will do much in restoring the supply of good ploughmen and labourers in the county of Essex, which they regret to say has of late years been gradually diminishing. Your Committee consider the present time most advantageous for this object, inasmuch as the New Poor Law Act encourages boys and yearly servants, by abrogating the settlement by hiring and service; and cannot leave this subject without expressing the obligation they are under (on behalf of the Society) to T. W. Bramston, Esq., M.P., for his second subscription of 2*l.*, "To be given to the Farmer who shall have had the greatest number of boys in his employ as ploughmen in the year 1835."

With regard to the prizes given to labourers and servants for long service, fidelity, and bringing up large families without parochial relief, your Committee beg leave to express their entire concurrence, and hesitate not in saying, they believe it will be attended with the greatest benefit, and humbly recommend an extension of this branch of the Society's objects so soon as the funds will admit, and to report that the Rev. St. John Mildmay and the Rev. John Bramston have signified their intention of doubling their subscription, and that such addition be expressly appropriated to the *Funds for the encouragement of labourers and servants.*

Under this head they have to mention the several names of John King, of Great Baddow; Peter Gamble, of Rivenhall; and Adam Avis, of Terling, as well worthy of the prizes they received for bringing up large families without parochial relief, and also those of the names of John King and Stephen Gowers, of Little Leighs, for upwards of fifty years' service on the same occupation.

Your Committee are informed that the instances here related have done good in the several parishes in which they reside, as well as neighbouring ones, and particularly that of John King, who received the first prize in both classes. The man has become quite an object of interest with the benevolent in his parish, and affords an excellent example to his brother labourers.

Your Committee have great satisfaction in report-

ing that the funds of the society, if not sufficient to enable them to make any great addition either in the number or amount of the prizes, are sufficient to meet the expenditure of the past year.

The CHAIRMAN.—It is right to call your attention to the specific object of the meeting to-day, the permanent establishment of a Wool Fair in the town of Chelmsford, and I hope that in due time it will operate to the benefit, not only of this county, but of others. We have such a fair at Ipswich, at Bury, and other places, and they have the effect of bringing together a great number of persons to the mutual benefit of the manufacturers and the agriculturists; they are links of the same chain, and can we do better than to bring the raw material before the consumer? There will be a time when the people of Essex will not be behind hand in extensively establishing these beneficial meetings, which elsewhere have produced such great benefits, to the product and manufacture of wool. (*Hear, hear.*) Since I have looked into this matter I have found some extraordinary anecdotes—facts which not only have amused but astonished me. Though I may not have been familiar with the practice of the shearing house, and am not farmer enough to enter into the merits of the shearers;—though I may not be a judge of sheep shearers, I am of sheep stealers, (*laughter*), and am fully aware of the importance of improving and promoting the growth of wool. (*Hear, hear.*) We have heard of the golden fleece, which I believe to be nothing but a beautiful mode of telling the story of the conveyance of wool from one country to another—a traditional story, expressive of the trade and manufacture of wool. We find that as far back as the year 1100, wool was woven in Oxford, and about 100 years afterwards one of the old Chroniclers—Gervas—states in Norman French that the people considered weaving to be a peculiar gift bestowed on them for themselves. We have been growers of wool—we have been skimmers from time immemorial. (*Hear, hear.*) Some years after the period I have mentioned, laws were passed by parliament to punish men for stealing of sheep; subsequently to that it was considered that the breeding of sheep threw too much land into pasture, and then the breeding of sheep to a certain extent was forbidden; and in 1634 a statute to that effect was passed. In the year 1201 or 1202, when a custom duty was laid on wool the inhabitants of the county of Essex paid only 3*l.* 3*s.* 4*d.* as the custom of their wool, and now we have spun wool of the declared value of 7,000,000*l.* annually going out of the country. Much improvement has been made in the spinning of wool, which has always been a great object with this country. (*Hear, hear.*) By the blessing of God, and our own industry, it has become a staple commodity, and I am glad to see such a meeting as this for the diffusion of its benefits. Mr. D. then observed that it was not yet known who would be the gainer of the silver cup, as purchases would go on during the day, but he should propose the health of the patriotic person who purchased the greatest quantity of wool as the Great Unknown. He then expressed his satisfaction at the result of the fair, and his regret that the lameness under which he had lately been suffering, had prevented his attending the fair in the morning. (*Applause.*) He hoped that whoever gained the cup, would value it as being the first won by a member of the society, and he assured the company that he was proud of being its first President. He concluded by drinking the health of the gentleman who should win the cup. (*Cheers.*)

The Secretary then read the awards of the Judges.

Richard Jarvis, who had gained the first prize for shearing, and — Neale, who had gained the second,

were then introduced to the Chairman. — Kemp, the third successful candidate, was unavoidably absent, but his master (Mr. Hobbs) undertook to convey to him the prize awarded.

The CHAIRMAN told the men it was no small honour to them that gentlemen like these had given them prizes as rewards for their skill and industry. He did not doubt that their characters in other respects were equally good; and he felt much pleasure in presenting them with the rewards. He hoped they would put the money they had thus gained to a good use, and apply it for the benefit of their families; and, added Mr. Disney, when you return home, let those persons among whom you go, know that the gentlemen of Essex do appreciate and reward merit. He then observed to Neale, that though he had not gained the first prize this time, he might gain it the next (Neale replied that he was the youngest amongst the shearers.)

The men then made their acknowledgments, and retired amidst much applause.

The CHAIRMAN.—I rise to propose the "health of the Members for Essex." Three of those gentlemen have sent notes, stating that they could not attend the meeting. There is no note from Mr. Hall Dare. The excuse of the members is, that they shall be engaged to night in the performance of their Parliamentary duties, and Mr. Dare is Chairman of the Committee on the Southend Pier Bill. These are friends to agriculture, and deserve your respect, we will, therefore, drink the healths of the members (*Loud cheers.*)

Mr. BAKER (of Maldou).—I consider that we are indebted to two of those gentlemen for their having given their votes the other day in favour of an inquiry into the currency, and they have owing to them a debt of gratitude from the agriculturists of the county. It is a grievous thing to see such men as O'Connell supporting the question, and representatives of this country resisting it. He felt convinced that if gentlemen would unite and give their attention to the currency, we should see the country in a much happier state than at present. (*Hear, hear, and some applause.*)

The CHAIRMAN said that conscious as they might be of doing good to the country by joining this Society, they must not be so selfish as to take all the credit to themselves, but look to other similar institutions, and he begged to give "the health of Lord Braybrooke, and the other Agricultural Societies of the county." They were all working for one purpose—with one intent, and he hoped to a successful one, and that the other Societies would be as successful as this. (*Loud cheers.*)

J. ROUND, Esq.—The President of the Society has done me the honour to assign to me the proposing of a toast, which I feel to be a great pleasure and honour, because I am confident it will meet your cordial approbation—it is the health of a distinguished member of the aristocracy of England—the Marquis of Chandos. (*Great cheering.*) High in station and high in character I consider the heir to the ducal honours of the house of Buckingham has considerable claims on the public gratitude and esteem. (*Cheers.*) My knowledge of that noble lord is not very limited, having the honour of his acquaintance, and I know that his views are most patriotic and his intentions most upright. (*Cheers.*) His persevering and incessant exertions during the last and present Session of Parliament to bring under the favourable notice of the Legislature the strong claim which the agricultural body have for protection and consideration justly en-

title him to our affection. (*Hear, hear.*) Mr. Round then gave the "health of the noble marquis" with three times three.

ASHURST MAJENDIE, Esq. in rising to propose the health of the Chairman observed that union is strength, and expressed his approbation of the principle adopted by this Society of admitting men of all parties. There was an old fable of the bundle of sticks, and if persons were excluded on account of their political principles, some would be excluded who had a large stake in the hedge. The toast was drank with three times three.

The CHAIRMAN in returning thanks expatiated at great length on the national importance of agriculture, and showed the dependence of manufactures and commerce on the cultivation of the soil. He then gave the "health of C. C. Parker, Esq. and the other gentlemen of the Committee."

Mr. PARKER in returning thanks, said that the credit ought to be given rather to the other members of the committee than to himself, as he had been prevented by business from giving that attendance which he could have wished. He begged to call the attention of the meeting to the exertions of the Secretary, who had been indefatigable, and had very much promoted the interests of the Society. (*Cheers.*) Mr. Parker concluded by proposing the "health of Mr. Gilson."

The CHAIRMAN said that the Society were greatly indebted to Mr. Gilson for his labours, and for his exertions this day, and on all other occasions, and for the intelligence which he displayed in conducting the affairs of the Society. He thought his health ought to be drank with the respectful attention of three times three, and he begged to add that Mr. G. got very little reward for his useful services. The toast was drank with three times three.

Mr. GILSON said he felt peculiarly gratified by the notice of Mr. Parker, and also for the attention paid to the toast. He was proud of the result of the day, and hoped that the arrangements gave satisfaction to the meeting. If his humble services could tend in any way to the improvement of the Agricultural interest, which was now so depressed, he should always be happy to use his exertions for the attainment of such an object. The Agriculturists had been slow in their efforts, but he hoped that the exertions of this Society and others would cause their claims to receive attention, and procure for them that remuneration for their capital and labour that was received by other classes of industry, and placed them in a better situation. He trusted that the Wool Fair in summer and the Cattle Show in winter would prosper, and he concluded by assuring the company he should always endeavour to do his duty while he had the honour of filling that situation in which he now was placed. (*Much applause.*)

Mr. MATSON said that something ought to be given to the unsuccessful candidates for the shearing.

The Secretary replied that he had given them 2s 6d each.

Mr. BAKER (of Writtle).—I rise to propose a toast which ought not to be passed over—one which will come home to the hearts of all present; it is the "health of the Ladies of Essex." (*Cheers.*) He then continued—Since our last agricultural meeting, opportunity has been given in the House of Commons for an expression of the opinion of the agricultural interest. You must have felt with me that we were expecting something to be done for us—that some boon would be conferred on us poor agriculturists. (*Hear, hear.*) At one time we were told that an alteration of the currency would be service-

able to us, and it has been insinuated to-day that it would cause a great revolution in our finances. I agree that we might make two sovereigns into three—

Here the CHAIRMAN told Mr. Baker that to enter on the question of the currency would lead to other subjects; and a political discussion would be the consequence—a discussion which the Committee had resolved ought not to take place.

MR. BAKER.—I wish to state a few observations that my brother farmers should not be buoyed up by false hopes—and that the currency question may not like the *ignis fatuus* dance before them over bogs, until it lead them to stick fast in the mire. I know it has been the case many years when the country has been flourishing, when we had all the talent and capital—

The CHAIRMAN.—Mr. Baker, I cannot allow you to go into that: if I do I must permit others to give their opinions to the contrary.

MR. BAKER.—I beg pardon, but—

MR. DISNEY (*laughing*).—If you stick to the ladies you will be right.

MR. BAKER.—Am I out of order? (*Contending cries of "No, no! Yes, yes!"*)

The CHAIRMAN.—I am unwilling to stop any gentleman who wishes to address us on general subjects connected with the cultivation of the soil, or the sale of wool to day, but it has been laid down by the Committee, that no particular political question shall be introduced. If Mr. Baker will adhere to the general question, it will be better than gentlemen calling out "no, no! yes, yes!" I must say he is a little out of our rule.

MR. BAKER.—I assure you, Sir, I considered that we, as an agricultural body, were assembled to state our opinions.

A Gentleman here exclaimed—Lord Western has addressed letters on the subject to the Society.

The CHAIRMAN.—We have no intimation of that; nothing has been introduced about it; I have not seen it.

MR. BAKER.—I will then state what I consider the cause of the present distress. We all know that at this moment we cannot realise as much from the land as will pay the expense of cultivating it. (*Hear, hear.*) We all know what it must be for a man to have to pay 100*l.* and only 80*l.* to pay it with. In such a case he must leave off business or compound with his creditors; that has been our state. (*Hear, hear.*) This country will, on the average, produce sufficient corn for its own maintenance. A gentleman has said he thinks good and bad seasons come in cycles; there I join issue with him. From the year 1827 to — we had a succession of bad seasons, and I believe that not a sufficient quantity of corn was grown for the wants of the country, and what was the consequence? a great importation took place, not only to affect us at the moment, but to fill every granary in the kingdom; and the bonded corn was long held over our heads, and as we had not met the time like other countries, by keeping our surplus corn—(*Hear, hear*)—and then the abundant harvest, instead of being a blessing, became a curse to us. I say a curse, because it comes to this—when wheat and flour are made the food of swine, because they are the cheapest articles, and when I see at one time the greater portion of the people eating barley bread, and the aristocracy eating no bread at all, because it is so dear, and when at another time I see bread given to the hogs, I say there must be something radically wrong, and I attribute it all to the operation of the Corn Laws. When wheat was at 60*s.* foreign corn was let in upon us in a quantity amounting to an inundation, and that has been operating upon us ever since. (*Hear, hear.*) But I

think I can hold out something a little more cheering. We have now arrived at the *minimum* of price, and it will be some time before foreign corn can be let in, and when wheat gets to 13*l.* a load, that will be a remunerating price. I think the farmer can grow it at that price. But we must go hand in hand; the landlord must assist the tenant, and the tenant the landlord, (*Hear, hear*), and if we follow up that principle, I doubt not that all will be well. I am sorry I entered too far into politics, but if the currency is a political question, and if we meet not to discuss such a question, then we shall be of no use as a Society. It is by union not only of men but of minds, that we can effect a great object, and if you chain the minds of men, they may as well stay at home. Mr. Baker concluded by expressing his regret for having violated a rule that had been laid down by the Committee. (*Cheers.*)

R. C. HASLEFOOT, Esq. proposed the health of the Judges of the day.

C. C. PARKER, Esq., returned thanks, and proposed the health of the wool buyers who had attended this day.

The CHAIRMAN gave the health of the Treasurer of the Society, T. Greenwood, Esq.

MR. GREENWOOD, in returning thanks, expressed his regret that Mr. Baker had been stopped in making remarks, because he believed that the Society had been framed for the purpose of discussing all subjects in which agriculture was concerned. He considered that the Currency question as much affected Agriculture as did the Corn Laws. (*Hear, hear.*) He believed that if Mr. Baker had been allowed to make his observations they would not have been unacceptable to the company. An idea had gone forth among agriculturists, which he thought injurious, and what Mr. Baker would have said might have gone materially to remove that idea. (*Hear, hear.*)

The CHAIRMAN said he had only acted by direction of the Committee, and should be very happy to attend any meeting of the Society that might be appointed to discuss the Currency or any other question.

MR. C. C. PARKER considered the question of the Currency not a political one; the questions the discussion of which he should deprecate would be those between the two parties of Whig and Tory. He much regretted that Mr. Baker had been stopped on a subject which was interesting to all.

MR. UNWIN, jun., returned thanks for the wool buyers.

MR. PARKER offered his growth of wool to Mr. Unwin, at 1*d.* per lb. more than he gave last year, but Mr. U. did not accept it.

MR. MATSON said he rose to call the attention of the meeting to the great purpose of the day. At his end of the room they were a little dissatisfied that more was not doing in the wool business. He, for one, was ready to sell his growth, and should like to know what had been done, but it had been done so secretly, that he knew nothing about it. He thought that the grand thing was to make this a mart.

The CHAIRMAN said he should like to know the market prices of wool this day.

MR. JONES said there were various qualities; the price of half-bred hoggets was 22*d.*, Downs, 20*d.*, and Down ewes, 16*d.*

Here Mr. Disney, accompanied by Mr. Round and other gentlemen, left the Chair, and apologised for doing so at so early an hour (it being only seven o'clock,) by referring to his lameness.

MR. PARKER was then called to the Chair.

Toast—"The health of J. Round, Esq., of Danbury Park," which was drank with great applause.

Mr. W. F. HOBBS offered his Leicester wool at 2s., and his second-clip Downs and Leicesters at 1s. 6d.

Mr. ISAAC BELCHER—I sold my hogget at 21d., and my Down wool at 16d.

Mr. JOHNS—I believe we were the buyers; and I beg to observe that Mr. Belcher gained a prize for wool.

The CHAIRMAN—A very proper observation.

Mr. HOBBS—I received the first prize for long wool. Mr. MASON said he had sold 120 half-bred Leicester hoggets at 22d., and 100 half-bred Leicester ewes at 21d.

Mr. BAKER (Maldon)—I sold my wool to Mr. Johns: Down ewes at 16d., but to no great extent.

Mr. W. COPLAND, of Writtle, said, that Mr. Johns ought to have credit for the competition that had taken place. He (Mr. C.) had to-day sold him 160 fleeces, down ewes, and some second clip half-bred Leicester at 16d. If it had not been for Mr. Johns, he thought he should have not got more than 15½d.

Mr. THOMAS BRIDGE, I should be happy to sell my wool, 1000 fleeces, half-bred hogget, at 2s.

Here the Chairman gave a toast "Live and Let Live."

Mr. W. CRUSH—I should be happy to make an offer to Mr. Unwin of my wool; 300 tags at 1s. 10d., and 100 ewes at 1s. 4d.

Mr. UNWIN—I will make you an offer of 1s. 9d., for the tags, and 1s. 4d. for the ewes.

Mr. CRUSH—I am obliged for the offer, but cannot accept it.

Mr. W. RIDLEY—I shall be happy to sell 300 Downs, and 100 between the Down and Norfolk, at 1s. 9d.

Mr. UNWIN—I will accept the 300 at 1s. 9d., and the 100 at 1s. 8d.

Mr. RIDLEY—That's a bargain.

The SECRETARY—By our rules if any gentleman says he will sell, and another says he will buy, that is a bargain.

Mr. SURRIDGE, of Feering, offered half-bred hoggets between the Norfolk and the Down, at 1s. 10d.

The CHAIRMAN—If they had been Leicester and Downs, I have no doubt the offer would have been accepted.

Mr. PORTER, of Writtle, sold his wool to Mr. Matthews—Down ewes at 16d.

Mr. CRUSH eventually sold to Mr. Unwin 100 Down and Leicesters at 1s. 10d.; 200 ewe hoggets, at 1s. 9d.; 200 ewes at 16d.

Mr. MATSON showed samples and asked 21l. per pack. Mr. Oram bid him 20l. 10s. which was accepted.

Besides the above the following quantities were weighed and sold in the fair.

|                                       | wt. | gr. | lb. |
|---------------------------------------|-----|-----|-----|
| Bought by Mr. MATTHEWS of Mr. Crooks, |     |     |     |
| Mr. Shepherd, Mr. Raven, and Mr.      |     |     |     |
| Hurrell (Boreham) . . . . .           | 24  | 2   | 27  |
| —by Mr. UNWIN, of Mr. Steele, Mr.     |     |     |     |
| Ruffell, and Mr. Christy . . . . .    | 15  | 3   | 27  |
| —by Mr. JOHNS, of Mr. H. Marriage,    |     |     |     |
| and Mr. Collier . . . . .             | 11  | 1   | 22  |
|                                       | 52  | 0   | 20  |

The above statements are from our notes, taken with as much care as possible, but if they contain any inaccuracy we shall be happy to correct it.

We understand that many other purchases were made during the day, the particulars of which we had no means of obtaining.

Much desultory conversation then took place on

various topics connected with agriculture, in which the Chairman, Mr. Trussell, of Danbury, Mr. Ridley, and Mr. Copland, took part.

Mr. COPLAND made an observation which gave offence to some gentlemen.

Mr. RIDLEY observed that though he did not like to pay tithe, and was a Dissenter, he would say that the far greater portion of the Church property was as much the property of the individuals who received it as the land was the property of the person who received rent for it.

It is with sincere pleasure we close our account by stating that the proceedings of the day were highly satisfactory to all parties, and gave rise to a most sanguine anticipation that this fair will confer highly important benefits on the wool grower and on the buyer. Such a mart in the county town has long been a desideratum.

The wool buyers are to send to the Secretary, on or before Monday next, a statement of the quantities purchased by them; and the silver cup will then be awarded to the gentleman who purchased the most wool.

## LORD STANLEY AND CONSERVATIVE CLUBS.

THE RIGHT HONOURABLE LORD STANLEY AND THE NORTH LANCASHIRE CONSERVATIVE ASSOCIATION.—In another column will be found a letter from Lord Stanley, addressed to Sir T. D. Hesketh, Bart., as chairman of the late meeting for the formation of a Conservative Association for the Northern Division of this county, and transmitted to us by his Lordship for insertion in our journal. His Lordship eloquently and argumentatively denies the alleged policy or necessity of establishing such a society, and deals out to the zealous associators a measure of castigation which they will find to be more startling than agreeable.

## NORTH LANCASHIRE CONSERVATIVE ASSOCIATION.

TO SIR T. D. HESKETH, BART.

Carlton-gardens, June 8.

MY DEAR SIR THOMAS—I have this morning received a copy of *The Preston Pilot*, containing an account of a meeting which was held in that town on Thursday last, for the purpose of forming a Conservative Association for North Lancashire. As this meeting was very numerous and respectable—as it was composed exclusively of those whom I have the honour to reckon among my constituents—as my opinions, or supposed opinions, were referred to by more than one speaker at that meeting—and as I have ever sought for, rather than shrunk from, an opportunity of making those opinions known to those whom I ought to represent, and to whom I am responsible for my conduct, I avail myself of the occasion offered to me, for the purpose—not of impugning the motives of those who originate—but of explaining why I deprecate the formation of such an association. I address myself to you, as having been the chairman of that meeting, and as being the chairman of the Permanent General Committee, without any fear that a difference of opinion on the policy of the course now pursued will in any respect diminish the sincerity of our old personal friendship.

I do not deny that the present is a period at which great interests are at stake. I do not deny that the Reform Bill itself, necessary as I believe that measure to have been, and called for by the deliberate

opinion of the country, may have had the effect of stimulating the desire of political change, and of exciting in men's minds an overweening anxiety for alterations in our institutions, and an unreasonable expectation of advantages to be derived therefrom. I am far from denying that to correct such exaggerated expectations, to reason away such overstrained desires, nay even to expose the sophistries of ignorant or mischievous quack doctors in politics, who impose upon the ill-informed, by persuading them that the benefit to be derived must be commensurate with the strength of the dose administered, may become the duty of those whom Providence has placed in a station to give them the means of forming a more dispassionate judgment, and the influence to add weight to that judgment on the minds of others. But that such objects may be most beneficially promoted by an organization of clubs and corresponding societies—that such organization, though it were compelled by an overwhelming necessity, can be productive of even partial good without entailing at least corresponding evils of fearful magnitude, I do, for my own part, utterly disbelieve.

And with regard to North Lancashire especially, where, let me ask, is the cogent necessity which calls for the formation of such a society? Are your objects general, or local? If local—if this be indeed a meeting of the constituency of North Lancashire, for the purpose of impressing or enforcing upon those who are the legitimate organs by which their sentiments are made known to, and effectual with, the Legislature—namely, their county members, the views which are set forth in your first resolution, I ask to which of us, my Honourable Colleague or myself, is this hint addressed? Which of us is supposed to require it? Which of us has failed to uphold the necessary connection between the Established Church and the State, the just prerogatives of the Monarch, the privileges of the House of Lords as an independent branch of the Legislature, and the deliberative power of the Commons House of Parliament unfettered and uncontrolled? For my own part, education, birth, position in society, principles, prejudices, if you will, all conspire to induce me to lend each and all of these my constant and unflinching support; nor, so far from believing them endangered, with the exception of the first, have I heard any one of them seriously questioned by any considerable portion of any deliberative assembly: and for the first, I should have hoped that the part which I have taken, the efforts which I have made, the sacrifices to which I have submitted, would have vindicated me, in the eyes of those who coincide in opinion with you, from any charge of hostility or even indifference to the connection between Church and State.

But you assure me, I will suppose, that I deceive myself; and that your Association is directed neither against my colleague nor myself; and with no purpose but the dissemination, within the sphere of your respective influence, of the principles which you possess in common. I am most willing to believe it: and still, admitting that your intentions may be good, I cannot divest my mind of the conviction that your means are injudicious. Against what are you defending yourselves? Are you united for the purpose of protecting your principles, and the representatives of your principles, against some dangerous counter organization, occupied in disseminating republican doctrines, in weakening the prerogatives of the Crown, in undermining the independent character of the House of Lords, in controlling the freedom of the House of Commons? If such general organization there be in North Lancashire, I have lived in an ignorance of it which I do not wish dis-

turbed. But if there be none such, as assuredly it is most desirable that there should be none, could the ingenuity of man suggest a source more certain to send forth such bitter waters, than the spirit that will be engendered by the establishment of your association. All the arguments of self-defence, all the reasoning by which as from an overpowering necessity you justify a deviation from the ordinary channels in which political feeling diffuses itself and evaporates, pass at once to the side of your opponents. They are those whom it is sought to oppress by combination—they are those who appeal to the sympathy of the country for the maintenance of the freedom of conscience, and more especially of "the deliberative powers of the House of Commons uncontrolled" by other influence than that of the constituents of each individual Member. You may say that you are numerous, and strong, and united: that your opponents, even if numerous, are disunited among themselves, and comparatively unimportant in wealth and station. If it be so, you have little to fear and little need of organization to oppose them. But beware then, for your own sakes, how you remove one cause of their weakness; beware of forcing them, for the sake of resisting your aggressions, to forget their own differences: beware how you organize the whole country in such a manner that every man must be a partisan; and do not deceive yourselves by thinking that such an occurrence, forced on by you, would strengthen your influence or augment your proportionate numbers. Beware, above all things, how you array the landed gentry and their dependents, in our mixed population, against the inhabitants of the mercantile and manufacturing towns. You ask no change in your county representatives, but you fear the democratic influence in the manufacturing boroughs. If you wish to create, to foster, to envenom it, interfere in their elections by your Conservative associations; bring an extraneous influence to bear on their internal proceedings; and if there be a democratic spark in the town you will kindle it into a flame.

But if, extending your views beyond local objects, you seek to form part of a general organization throughout the empire, of county clubs, and local clubs, and district associations, acting in concert, usurping, in fact, the powers of a government, and combining to carry on the affairs of the country through their instrumentality—I can conceive nothing more dangerous to public liberty, nothing more injurious to a stable or rational Administration than such a state of things. Power vested in clubs acting in concert for national objects was one of the most dangerous symptoms of the early stages of the French Revolution. Thank God! I see no cause here to anticipate such scenes as then occurred; but if there be a course calculated first to control the House of Commons, next to call in question and put in jeopardy the privileges of the House of Lords, the Church and the Throne, and in the progress of the operation to destroy public peace, private happiness, and national confidence, it would be a system which should establish throughout the country, for political objects, and for permanent and systematic exertions, two rival sets of political associations engaged in a deadly struggle with each other for the maintenance of extreme principles—throwing over by joint consent, at the first onset, the incumbence of all those who would lend themselves neither to the one nor to the other, and then entering upon a protracted (and the more protracted the more embittered and irreconcilable) warfare of opinion. You will not do me the injustice of supposing that my views of this question are biased by the consideration that I should myself be part of the lumber

thrown overboard in the first process of clearing the deck for the general action. In such a state of affairs public life would have even less attraction for me than it has at present. I hold it to be an honourable distinction to be the representative of a great county: you must forgive me if I say that I should hold it none to be the nominee of a club self-styled either Conservative or Liberal. Already, as you are aware, other associations are establishing themselves with avowed objects not less plausible than yours to maintain the freedom of elections, to protect the registration of votes, &c. The promoters of these associations admit that their effect, will be to tear the country in pieces, and to render the task of Government almost impracticable; but they shelter themselves under a political necessity of counterbalancing the combined organization of associations similar to yours. It is a lamentable state of things when national good is sacrificed for the attainment of party triumph: but that party incurs a heavy responsibility which takes the first step towards provoking such a conflict.

I have already said that I do not impugn the motives of those who have been engaged in forming the North Lancashire Conservative Association: where I conceive the fundamental institutions of the country to be endangered, no one will more strenuously and earnestly defend them than I will; but my feelings and opinions having been so directly referred to at your meeting, I hope I am not impertinently or unnecessarily obtruding myself when I venture to express my belief that the course pursued is uncalled for by any urgent necessity; and if not urgently necessary then mischievous; and when I presume earnestly, as a friend to the peace and happiness of our common country, and especially of our hitherto undisturbed and contented district, to warn you not to incur certain and formidable evils in the pursuit of very doubtful good; and above all to beware lest you create the very evil which you seek to avoid, and render that danger real or imminent, which as yet is distant, if not imaginary.

Believe me, my dear Sir Thomas,

Very sincerely yours, STANLEY.

## ON AN IMPROVED METHOD OF MOUNTING THE CRADLE-SCYTHE.

(From the Quarterly Journal of Agriculture.)

So far as I recollect, the Rev. Mr. Farquharson of Alford stated, in his former communication to the Highland Society on scythe-reaping, that latterly no appendage whatever was used on the scythe, in his neighbourhood, for assisting in carrying round the cut corn to the swathe; and that scythe-reaping had been brought to its present pitch of perfection by laying all that sort of thing aside, and using nothing but the common hay scythe. In his last paper, however, he seems to admit the necessity of using a bow, except when the crop is much lodged; but even in that case I am clearly of opinion that some appendage on the scythe is indispensably necessary, and certainly would prefer a small rake to anything I have yet seen. I have now had another year's experience of the cradle-scythe\*, and have no hesitation in saying that it is the most efficient implement of the kind that I know of. Its superiority to the "long curved handle" consists, as I formerly stated, in the comparative ease with which it is wrought, which every person who has used it, and with whom

I have talked on the subject, readily admits. I do not say that an experienced mower will not make sufficiently good work with a scythe fixed to the long curved handle, provided a rake be attached to it; but let any one compare such and the cradle-scythe at work together, and he will be at no loss to discover the preferable implement. Before the introduction of the cradle scythe, the scythemen used to complain a good deal, for some days at the commencement of harvest, of *sore sides*; but no such complaints are now heard of. This is easily accounted for: Before the cut corn can be laid nearly square to the uncut with the long curved or common handle, the mower's left hand requires to go at every sweep considerably farther round to the left than with the cradle-scythe, owing to the position of the handles on the sned; and this, of course, occasions a corresponding turn of his body in that direction, which must be very sensibly felt.

The rake can be made very light; in fact, very little, if anything heavier than a bow, and the expense of either is trifling. I find that one bar about 3-4ths of an inch thick quite sufficient to hold the teeth; and for all the cost I would recommend having rakes of various lengths, of from ten to thirteen or fourteen inches. For one of the shortest size, three teeth are commonly used; but I think they are no worse of four; and experience has taught me that much shorter teeth than those generally in use answer equally as well, and are much more easily disentangled of the cut corn. The teeth should be curved a little, like the blade of the scythe. Last harvest, a friend of mine suggested it as an improvement to have rakes of a circular form, and made so as to move out and in on a hinge at the lower end, in order to suit the different inclinations of the crop. Coinciding in his opinion, I got some of them made for a trial, and have the satisfaction to say, answered remarkably well. The head of the rake is eleven inches in length, and is curved to form a segment of a circle of about one foot four inches radius. The uppermost teeth is from five and a half to six inches long, and each of the three lowermost extends an inch beyond the one immediately above it. Instead of the rake being fastened to the heel of the scythe, as mentioned in my last letter, a piece of iron with two upright plates is clinked to the back of the scythe, about an inch from the back end of the blade. The rake is inserted between these upright plates, as in a socket, and a round nail with screw and nut is passed through them to keep the rake in its socket. By this contrivance, the rake can move backwards or forwards on the round nail as occasion requires. It is held steady, in whatever position it is placed, as follows: The small iron rod that connects it with the left handle of the frame is made thin at the end, and has seven or eight holes in it about 5-8ths of an inch asunder. This part of it is bent so as to correspond with the limb or plane of the handle, to which it is held fast with a nail and thumb-screw, and by which it is readily shifted. The nail is put through the handle, from the lower side, six inches above where the handles unite. When the corn stands upright, there is no difference in the position of the rake to the blade and handle of the scythe from the straight rake, except that the former is placed on the back edge of the blade, and the latter fixed into an eye-headed wedge at the heel of it. Both stand perpendicular to the blade, and it is only when the corn lies away from the scythe that the position of the circular rake differs from that of the other. If the corn be lodged or partly laid over with wind at the time of mowing, the circular rake is set back at the top by shifting the holes in the end of the rod that holds it fast to the handle, so as to answer the lay of

\* Cradle, a frame for a scythe. — *Bailey's Dictionary*.

the corn; and it is in this respect that it has the advantage of the straight-headed rake.

Last year, part of my crop, both oats and barley, was a good deal lodged; indeed, some of the former, on soft mossy land, were laid flat and twisted in every direction. The operation of cutting was consequently more tedious; but all was performed with the scythe in good style, and at much less expense than it could otherwise have been done. In instances of this kind, I would humbly recommend to cut *in* instead of *out* of corn, as it is usually termed. I adopted this plan last season, and really think it a good one. At first the scythemen were averse to it, but in less than half a day they changed their opinion, and acknowledged it to be the best. I commenced with it in a field of pretty ripe potato oats, which were a good deal lodged, and the grain dropping off in the working; and it was soon discovered that there was less loss of grain, a much freer cut, fewer rakings, and a neater stumble,—circumstances of no small moment to the farmer. The corn can be laid round, as even, and nearly as square, the one way as the other; but cutting *in*, if the crop is thick, seems rather hardest for the uptaker, which is owing, in some measure, to the free working of the scythe on the right hand, which allows the operator to come more speed.

Now that that very important operation, scythe-reaping, has become common in many parts of the country, and is practised in various ways in different places, it occurs to me that it would be an object well worth the serious consideration of our agricultural societies to promote its improvement, by holding competitions, and awarding prizes to the most meritorious competitors, as in the case of ploughing matches.\*

## A PAPER CURRENCY TO IMPROVE TRADE.

MR. EDITOR,—Every tradesman finds his business getting worse and worse, and every one knows that the distress brought upon trade and agriculture is owing to the gold currency, and there is no prospect of any improvement till a paper currency is given us. Now, the present Government says *it cannot be*. The Tory Government has said, *it shall not be*. What, therefore, are we to do, but to make a paper currency ourselves, and it may be done very easily and securely, and it would revive trade. Suppose I were a draper, or in any other trade, I would advertise, and send a circular round to my customers to say, that I would give them the usual credit, six or twelve months,—and then I would take an I O U for the amount, payable on a day agreed upon. Suppose I go to my draper, to pay my Christmas bill, and it is 27l. 14s. 6d. I pay 7l. 14s. 6d in cash, and I give four I O U notes, of 5l. each to be paid in cash, three months after, or at any time agreed upon. Suppose my name is Chalk, or Stone, or anything else, it is sufficient that I am considered a substantial man. I have given my draper four I O U notes of 5l. each, perhaps he wants to turn one or two of those I O U notes into cash—he goes to his neighbour, Mr. B., the ironmonger, and asks him; Mr. B. looks at the I O U, and says, I know Mr. Stone very well, he is safe enough; I will give you cash for it. In this way every tradesman might act, and it would be

better for him to have his cash box full of I O U notes, of substantial men, than to have his shop full of goods—and perishable goods—and no trade.—I can see no objection to this proposal; and it has been acted upon by the London bankers and merchants; and it is acted upon now by many manufacturers and farmers: for it must be known to any thinking person that there is not cash enough in England, nor half cash enough, to carry on the concerns of trade.—Some might say—one don't know who are substantial persons. A tradesman knows well who the substantial farmers are. Some might say the bankers won't like it, and they will make wry faces at it. But it would be for their benefit, for trade would be increased, and their notes would come more into use. For what objection could they have to give cash for Mr. Stone's I O U to a respectable tradesman? If any one can suggest a better plan than this, let him do so; for if something be not adopted, hundreds and thousands of tradesmen must give up.

MERCATOR.

## WILLINGDON SPARROW CLUB.

The members of this Club met lately at Willingdon, for the purpose of passing the accounts, &c.—The following return was produced by the Secretary of the numbers of sparrows and Eggs destroyed since the establishment of the club in 1832: viz:—

|      | Sparrows. | Eggs.                    |
|------|-----------|--------------------------|
| 1832 | 900       | No account of eggs kept. |
| 1833 | 2174      | 2580                     |
| 1834 | 2487      | 1203                     |
| 1835 | 4984      | 4308                     |
|      | 10545     | 8091 Total.              |

A premium is given to the person who destroys the greatest number of sparrows; and also to three boys who produce the greatest number of eggs.—The business of the club had concluded, about thirty gentlemen sat down to an excellent dinner, at the Red Lion, served up in a style of great superiority, which reflected the highest credit on Mr. and Mrs. Durrant, the landlord and landlady, and which could not have been excelled in houses of higher pretensions. Mr. J. Putland was in the chair, and Mr. T. Noakes, the Secretary, officiated as deputy. The day passed off with great pleasantry.

PRODUCE OF AN ACRE.—The Maine farmer enumerates the following articles as the produce of a single acre of ground, the past season. The land was cultivated by Stewart and Wadsworth Foster, but its situation is not mentioned:—Half a ton of hay; one hundred bushels of potatoes; eighty bushels russets, greening, and Baldwin apples; thirteen bushels of pears; twenty-five and a half bushels of parsnips; twelve and a half bushels, of beets; six bushels of carrots; thirty-five and a half bushels of onions; one bushel of corn; one bushel of beans; two hundred and ten pounds Isabella and Lisbon grapes; two hundred and twenty-three cabbage-heads; one hundred bunches of onions, carried to market; ten bushels cucumbers, for pickles; twenty-eight bushels of cider-apples; eight pounds of dry sage; eighty-one apple trees, in a bearing state, and four pear trees; three bushels of currants; three bushels of turriips; one hundred grape-roots raised and sold, and ready to sell next spring; three hundred and thirty-two mulberry trees, fit to sell,—and a plenty of green sauce of all kinds, for two families.

\* We cordially recommend this suggestion of our intelligent correspondent to all agricultural societies.  
—EDITOR.

## ON PRESERVING DAHLIAS FROM SLUGS.

BY MR. H. BOWERS, FULHAM, MIDDLESEX.

*(From the Irish Farmer's Magazine.)*

Gentlemen,—If the following plan to protect young Dahlias, and other plants, from slugs, is worth a place in your valuable Magazine, it is very much at your service :—

Some few years since I superintended the reclaiming of a gentleman's garden which had been neglected for many years; and in changing the face of the whole, had an opportunity of destroying the hordes of vermin which infested the place, by burning and trenching the soil, and entrapping them in every possible way. Nevertheless, in the spring of the third season, when finishing the gardens, I discovered the common slugs (*Limax agrestis*—*hyalinus* and *ater alba*), to be very numerous, and annoying to the garden crops. Having procured a choice collection of Dahlias,—including the splendid Irish varieties, which were very scarce at the time in the London nurseries, and consequently small and expensive,—I felt great anxiety about protecting them; however, about the middle of May, I determined on planting a few of the cheapest and strongest kinds, by the way of feelers; and I then strewed hot slacked lime about some, shook saw-dust and coal-cinders about others, but to no purpose, for next morning my "*Lady Liverpool*," "*Star of Brunswick*," and "*Mountain of Snow*," were levelled with the dust. I planted others, and watered the ground with acids; indeed, after various experiments, I proved the following to be most effectual and satisfactory :—I procured a quantity of horse-hair, and cut it into lengths of four inches, which I mixed up in a heap, and twisted into large string of eighteen inches long; two or three of these platted together, (resembling what milk-maids use to restrain a kicking cow) and the ends nicely joined, giving them a ring-like, or circular appearance. When the required number is made, (one for each plant) and the Dahlias planted out, break the earth fine, and strew fine sand or coal ashes around each; then put on the rings of horse-hair pressing them slightly in the sand to prevent the slugs from getting underneath, and the numerous prickles on the hair guards will be a complete barrier against their getting over, either in wet or dry weather. It is amusing to see them approach the guards,—the instant they touch them they shrink back as if pricked with a hundred needles. The shorter the hair is the better, as furnishing a greater number of ends or prickles on the surface, which presents by no means an inviting road to these tender-bodied pests. Horse-hair is easily got in most country places, and readily made up for this purpose by any handy man; they have a neat and orderly appearance in the garden, and with a little care will last for an age. In this way I have preserved the Dahlias, some of which were very delicate, from these destructive intruders.

preserved for the table. The subject which we now, however, allude to, is a tree of the continent of South America, and is of recent introduction. The species *Cuttleyanum*—Cattley's or the purple-fruited guava—was introduced in 1818, and is a strong evergreen. The leaves are firm in texture, oval, somewhat pointed; the edges without any indentures or n flowers are small and white, produced o branches in great numbers, and are succeeded by berries, which become ripe in the winter. These are of a dark purple colour, about the size of small goose-berries, pulpy, and contain several seeds, which may be sown in January or February. We are enabled to speak with confidence of the treatment which the Guava demands to bring it to a fertile state. Let the seeds, divested of pulp (by rubbing them gently in the hand with some fine soft mould), be sown immediately in a pot of light loam, mixe with one-third of heath mould, and covered with the same to the depth of one-fourth of an inch. Press the surface even, and keep the earth constantly in a gently moist condition, and the pots in a house or frame where the heat will never be less than 52 degrees at night. The seed-leaves will soon appear, and when the young plants are two inches high, raise them very carefully, and transfer to very small pots, containing a soil composed of half loam and half bog-earth, or leaf-mould, one plant to each pot. Shade at first, and at all times give water regularly. Shift the plants as the roots reach the sides, which will be, perhaps, three times during the first year; and at every remove increase the proportion of fine rich loam. If the plants be cut back four inches, when they attain the height of 12 inches, the number of lateral shoots will be greatly increased, and the shrubs will resemble the pretty specimen figured in No. 5, p. 119, of Mr. Paxton's *Magazine of Botany*, though it must be admitted that the lateral shoots of the plant do not always assume so regular a form. If the leaders be not shortened they will grow erect without producing a succession of side shoots. Fertility will soon result from the amputation of the head of the main stems, and in two years from the sowing of the seeds, blossom-buds will, in many instances, be seen upon plants not two feet in height. The interest attached to this fine evergreen is greatly enhanced by the facility with which it adapts itself to almost any situation. After the first winter it may be kept in the green house; and in June may be exposed with myrtles and other plants. It has been kept in the open air till November, and received no injury from a degree or two of frost. It delights in frequent waterings, and retains the full verdure of its fine large opposite leaves, which literally clothe the shrub from the very surface of the soil. A few small plants will furnish a dessert, and these may be grown in pots scarcely seven inches broad at the rims; but in large pots or tubs, and especially if it be planted in the soil of a warm conservatory, the purple Guava will become a fine tree and yield a vast abundance of fruit.

## EPITAPH ON A GARDENER.

Beneath this sod an honest gardener's laid,  
Who long was thought the *tulip* of his trade;  
A life of many years to him was known,  
But now he his withered like a rose o'erblown.  
Like a transplanted flower be this his doom,  
Fading in this world, in the next to bloom.

THE GUAVA.—As a delicious article of the dessert, Guava jelly has long been known and esteemed; but few, perhaps, are acquainted with the tree which produces it. *Psidium pomiferum*, and *pyriferum*, the apple and the pear fruited Guava, are natives of the West Indies, and bear eatable fruit, which is also

## AGRICULTURAL REPORTS.

## BERKS.

The weather since our last has been everything that the occupiers of the soil could wish for; it has been alternately hot and cold, wet and dry, sunshine and cloudy, so that nearly every soil and situation has been suited. The gentle rains have brought the grass along beyond our expectations, and there appears everywhere the prospect of a bountiful crop of hay. The ray-grass is already fit for the scythe, and is grown of a fair length; and the clover, where the land is in good condition, promises uncommonly well. Trefoil and Dutch clover are also in a flourishing state, and many of the meadows would now mow more grass than they would last year at Midsummer, but we think that the crop of sainfoin is no better than it was last year. Scarlet clover, where there is a stock, has a beautiful appearance, and a great proportion will be saved for seed, and as the yield is generally most abundant, we shall not wonder if the market is overdone next year, and the price at one-third of what it was last seed time—a rich, gravelly, forward soil seems to be most suitable for this plant, and it is much more nutritious in a green state than when made into hay. The sowing of turnips has already commenced, and some few pieces are up and looking well, and the fallows are altogether in a fine and excellent state for this crop, and if the fly is not too numerous and too busy, there will most likely be an abundant crop. Rape gets more and more into fashion, as it is found to be better than any other kind of food for sheep, and the wheat grown after it is found to yield more and be a better sample than it is after vetches or turnips, and a great deal of rape has already been sown. The wheat on deep rich land is in general very broad in the blade, and of a particularly black hue; and will, we fear, as soon as it is out in ear, if not before, fall down and sustain great injury, and in some places, in the vale of Berks, the flag has been cut off with scythes to prevent its falling; on hills, and on high and exposed situations, the cold frosty nights have turned the blade yellow, but we do not believe that much injury has been sustained. The charcoal and poppy has amazingly grown and increased, and seems likely to get high and overpower the wheat and do it a vast deal of injury, and the late dripping weather has been uncommonly favourable for the growth of weeds, while it has kept the wheat so continually wet as to prevent the weeds from working. Although the look of the wheat crop to a passer-by is doubtless pleasing and satisfactory, and nothing that we can state will have any effect on a superficial observer, yet we must beg leave to state that we never knew a showery May produce a yielding crop, and, in our own private opinion, and which opinion has been formed after thirty years of observation and experience, the prospect is not in reality a good one, but we confess that our opinion is not the general one. The early-sown oats are looking uncommonly well, and are free from weeds, and promise an abundant crop. Beans and peas have also a very luxuriant appearance, and promise well, at least, for a good crop of straw. A part of the barley crop on light and chalky soils has been very seriously injured by the wire-worm, and in some places this mischievous insect has committed such depredations, and made the barley so thin of plant, that some of the pieces would be immediately ploughed up were it not that they are sown with grass, which has taken well; on deep soils, and on loamy and gravelly soils, the barley crop pro-

mises uncommonly well, and the bulk must to a certainty be great. Every kind of grain is we think a fortnight later than it has been for the last two years, for some of the wheat does not yet show any swelling for the ear, although it is grown of a good length, and we think, in some instances, the month of June will be past before the ear is fully out. The wheat markets continue in the same dull state, and as this is nearly the only grain a farmer has to sell, he is often put to most terrible shifts, and it is probable that, notwithstanding the low price at which wheat is selling, there will be less left in the farmer's hands than there was last year, because the majority of the farmers will be obliged to dispose of it for the purpose of paying their way. Sheep have maintained their price, and, contrary to the usual rule, ewe tegs have been more inquired after and sold higher than wether tegs. Lambs have begun selling at much higher prices than we expected, and we have heard of good lambs having been sold from the mother's side at 20s. per head. The wet weather that so damaged the wheat in this county last harvest has unfortunately done other mischief, for it has rotted many of the sheep, and we know of one or two parishes where it is just discovered they have not a sound sheep in the place, so that loss upon loss seems to rapidly fall upon the farmers in some situations, and many must inevitably be ruined in spite of all their efforts. A few of the long-woolled and white-faced tegs have already been shorn, and 50s. per tod has been asked for the wool, but we have not yet learned that any bargain has been made: sheep keep is everywhere most abundant, and the vetches are far better than usual. The crop of cherries is in general a good one, and we are in hopes that the apple crop will be equally good. Potatoes are very plentiful, and are pushed into the market in double quantities, and the common sorts may now be purchased at a shilling a bushel, and the low price at which they may be bought for seed has induced persons to plant more ground than usual this spring. Pigs are getting higher in price, particularly small ones, and if the beans and peas and barley turn out to be a good crop, so that food may be plentiful, it is fully expected that pigs will be dearer. There is a great breadth of turnip seed saved, and as soon as the same can be brought into the market, there will most likely be a fall in the price. The system of paying the able-bodied paupers in bread and other provisions has been adopted, but much murmuring and discontent has been the consequence, and in some few places the provisions have been systematically refused, and some turbulence and disorder has ensued; for our own part, we think this practice one of the best parts of the New Poor Law Bill, and we hope and trust that it will be persevered in throughout the country, for it is most shameful that the money extracted from the pockets of the suffering and industrious farmers and tradesmen, for the professed object of feeding the poor and destitute, should be squandered in ale-houses and beer shops by a parcel of idle and saucy fellows, who for several years past have been living on the industry of others. The man that is improvident ought to be paid in provisions instead of money, and he can have no real ground of complaint if such is provided for him to a reasonable amount, and no man ought to have the handling of money who is able to earn money but who will not, or does not try to earn it, and the able-bodied pauper ought never to be so well off as the independent labourer, or there will soon be an end to all industry.—June 1.

## SOMERSETSHIRE.

Hitherto there has been but little clear settled summer weather, with the degree of heat usual at this season; and there are no indications of an early harvest. The growing crops of corn and pulse of all kinds are however thriving, and in very many instances luxuriant. Of hay, particularly in the meadows, it may be calculated that the produce will be much greater than during any of the three preceding years. Vetches have been abundant, and the lands on which they were grown have been either planted with potatoes, or are under preparation for turnips, which, with a moderate quantity of fresh dressing, in addition to the produce of the fold, in this system are generally very good.

The orchards received a severe check from the frosts in May, when the blossom was injured to a considerable extent on the early fruits, but of even these there will be a good sprinkling, and of all others, unless fresh accidents should occur, the produce will numerically be unusually large. Yet we do not anticipate that the cider will be in proportion, for the number of crumplings seem to be immense. It is almost impossible to quote the price of cider. Whatever be the offer, the seller accepts it from dire necessity.

Of the various articles of farm produce, fat beasts alone have obtained an advance since our last report. Prime winter-fed heifers and small oxen are now worth 9s. a score. The season for maling is just passed, and the sale of barley closed for more reasons than one: there is none in the hands of the growers.

Our best thanks are due to the Marquis of Chandos for his noble perseverance in seeking to alleviate the urgent distress of the agriculturists, although we have never been among those who thought this object could be obtained merely by remission of taxes. This, however, may be co-efficient with other means, and is not to be undervalued. But if the agricultural interest, in which we include both landlords and renters, escape general ruin, there must be an alteration in the currency of such a nature as to enhance prices. Last year we were told how much benefit was to accrue from the new poor law; but we find none, the expenditure is as great as ever, more persons are in the workhouses, and more idle fellows are nominally set on work, but literally are more idle and profligate than ever. We receive prompt and civil answers from the board of commissioners to any interrogatories, but of the rules and regulations for the guidance of parishes and select vestries, we are still left to conjecture what they may be. The Radical press would wish us to believe that a reduction of rent is all that is wanted to make the condition of the farmer quite delightful. But at present prices of corn, tillage land can pay no rent. What is then the landowner to do without an income? On this farm, in 1793, the palmy days of the economists, *eighty bushels of wheat paid our poor rates*; we are now obliged to sell *three hundred to discharge them*. *Sixty bushels of wheat* paid the lay impropriator for tithes; now he demands *one hundred and fifty*. *Three hundred bushels* discharged the smaller parochial rates and labour; now *eight hundred* are hardly sufficient. With the present amount of national debt, and the incumbrances on land, let the economists solve this problem.

## SUSSEX.

We sit down to write our monthly report with a heavy heart—for on every side the agricultural

horizon, (if we may be allowed to use the term) seems dark and gloomy—and scarcely a speck of light to be seen even to warrant the hope of returning sunshine. There have been three motions made in parliament for our relief—two by the Marquis of Chandos, and one by Mr. Cayley, all of which have been negated by considerable majorities: as in each case several members whom we know to be at heart sincere friends to the agricultural interest, have either not supported the motion or voted against it,—we are quite sure that they have failed to do so from a conviction that better times are at hand and that other remedies will be applied. Most heartily do we pray that they may be correct—sure are we, that one more year like the last will crush many thousands of industrious men—occupiers of arable land.

In this county as we said last year, the humorous caricaturist, H. B., might make an excellent hit, respecting three farmers in the water, one up to his neck, merely resting his head on a cloth of wool; the second in the same state, varying it by resting his on a pocket of hops; the third unfortunate man who has neither to rest on, just making his disappearance being engulfed in the deep. The moment there comes a general good crop of hops, down will go the price, and the growers will be as bad off as they were some years since when hops sold at 40s per cwt.

Again, as to the wool growers, if through a great increase of importation of foreign wool, and a sudden falling off in demand for our woollens, Southdown wool should fall, as a few years ago, to eight pence per pound, they would sink with their brother farmers. One need bring forward no other argument to prove the unfortunate situation in which the agricultural interest is placed, than the fact that nothing but a bad harvest can be of service to them.

The late rains have been very partial—in some places the barleys are suffering very much from the drought. Wheat on strong soils look very well, but on the lighter soils the dry weather has been too much for it. In this county, the labourers in some places have, from mistaken feelings, shown symptoms of resistance to the New Poor Laws; but, by the prompt measures of the magistrates, the ringleaders have been secured and things are going on quietly. All that is wanted is to enable the farmers to employ them, but at the present price of wheat it is quite out of their power to do so. In your last, it was stated by a correspondent, that it was the intention of ministers (or rather, we suppose, of Mr. Poulett Thomson), to reduce the duty on foreign cloverseed; this, we should think, must be a mistake. We cannot believe the government so lost to all feeling for the farmer as to discourage the grower of an article which gives more employment for our labourers in the winter season than any other produce of the soil. Should it be proposed, we trust every market town in England will immediately petition against it; and let every member of parliament be urged to oppose so impolitic a measure.

## NORFOLK.

Although the wheats have materially improved in their appearance since our last report, yet the prevalence of cold northerly winds and frosty nights has contributed to keep them in check and to confirm the opinion which we have uniformly advanced relative to the backward state of the crop. As compared with last year, there will be a difference of nearly three weeks in the process of shooting the ear, which then commenced about the 25th or 26th of May, whereas at the present

moment there is no probability that a wheat-ear will be forthcoming before the 10th or 12th of June. Thus the commencement of the harvest will necessarily be deferred to the second or third week in August, or even beyond that period if it should happen to be dripping weather, of which there is some probability. This will afford a month's additional consumption to clear off the surplus stock of old wheat arising from two super-abundant harvests in succession—namely those of 1833 and 1834. Now experience has at all times contributed to establish the fact that however trifling the supply of any article, which must be forced upon the market, is above the demand, and *vice versa*, that the value of that article will be raised or depreciated thereby in an undue proportion; a notable proof of this position may be adduced from the relative prices of wheat and barley during the last malting season, and in the price of beef at this moment compared with what it fetched within the lapse of one month only. No further demonstration is required to establish our position, and we confess that we are somewhat sanguine in our expectations that similar causes will produce similar effects in the price of wheat before very many weeks have transpired. Barley and oats are rather of a questionable character, particularly the former; in some districts the plant is promising and luxuriant, and in others meagre and unhealthy, and so thinned by the wire worm that it would seem more than two-thirds deficient of plant. We do not anticipate a very heavy crop of hay, although the weather would seem to favour that supposition; nevertheless the land is well covered, the bottom thick set, the stem fine, and the quality will be excellent if the season should turn out propitious for the harvesting. The clipping season is likely to satisfy the wool growers; generally speaking the fleeces weigh well, and the price of wool from 50s to 56s a tod, with rather a tendency to advance than otherwise; this with the improvement in the value of beef will help to bring up some of the lee-way and back-reckoning of those who are fortunate enough to be the holders of either the one or the other.—June 1.

#### RUTLANDSHIRE.

This county is remarkable for its quantity of useful land, suitable to a variety of modes of husbandry; it possesses fine rich pastures and excellent red tillage land, and generally throughout the county well watered: it has hills, dales, woods, and abounds in pleasant and beautiful scenery. It is not a thickly populated county, but its population in the humbler classes are aided and assisted in almost numberless instances by voluntary charity in the shape of county institutions, district institutions, village institutions; in short, it may fairly be said, the county of Rutland, in acts of benevolence, stands foremost in the rank of prosperity, if there is any to share. These voluntary contributions and personal services of the more wealthy part of the inhabitants adds much towards the reduction of compulsory payments. Consequently rates and payments usual upon occupation are for the most part under the generality of amount.

The occupiers may be considered an intelligent people, possessing much good will and feeling for each other, and though agriculture is so much depressed in all parts of the country, this county bears up against such alarming depression with unaltered *zeal and industry*; and no county in England has made greater improvements in husbandry in the last seven years than this.

The fine weather of late has rapidly brought forth promising crops of hay, the clovers are abundant, and in some few instances cut: old hay is very scarce, but lately reduced in price. The pastures have been quite as good as in former seasons, and the sheep turn out of their long wool in good condition; the price of the latter does not appear to be settled, about another fortnight will inform the sellers what may be expected, but it is thought that at present it will not command so good a price as last season; 42s per tod for mixed clips is spoken of. Beasts are backened in condition in consequence of the hay being scarce in the spring.

The wheats look well, and promise a full crop, but there are not the acres sown as in former years. The price of this article causes general dissatisfaction, 36s to 38s per qr., and *must ruin* the occupiers of thousands of acres of land, even if the landlord gives up *all his rent*.

Barley, oats, and beans promise well. Some few turnips have been sown with varied success, but the last week has been considered favourable, and the preceding burning suns unfavourable.

Oak and oak bark lower than last year by about 10 or 15 per cent.

What will be done for agriculture generally remains to be known, evidently it is and has been a bad business to follow with a view to profit, and is likely to continue so if the *burthens* are not taken off, and all foreign produce imported under better regulations and higher duties. Many of the great landholders say why do not the farmers *unite* and petition government? The farmer answers with question—Why don't you unite and save your estates from the monied interest?—June 16.

#### NORTHUMBERLAND.

Since my last report we have had a continuance of cold dry pining weather, with generally frosty nights, which has caused a late backward spring, in consequence of which, almost every particle of both hay and straw have been eat up, and the pastures kept very short; within these few days we have had some fine rains, which has changed the appearance of the country very much; the winter sown wheat is looking tolerably well considering the cold weather which we have had, and also the spring crops are looking well. It can now by no means be an early harvest; fortunately there is a great quantity of wheat in hand, so that there need be no apprehension of any scarcity on that account.

Our markets here for wheat still keep in a very languid state; the best wheat is scarcely worth 5s per bushel. Oats have considerably improved in price, and barley also, owing to its being in few hands.

Beef is selling from 5s to 6s per stone; mutton 4d to 4½d per lb. clipped sheep.

The market at Whitsunbank for rough hogs was about 4s a-head lower than last year's price; the best Leicester hogs 36s a-head, and inferior from 30s to 32s a-head; a dull market, with few Yorkshire buyers out.

The sowing of turnips has now commenced pretty generally, the Swedish turnips being nearly all sown. The weather within these few days has been rather wet, and retarded that operation, but as soon as it gets out again, the sowing of white turnips will commence briskly.—June 4.

#### CUMBERLAND.

Since our last report the weather has been favourable for the farmers in the cleaning of land

for the different green crops. Potatoes were planted in what was considered in fine order, but great complaints are made that large plots have not vegetated. Turnip sowing goes on without any interruption, and in general the land is well prepared for the seed: the fly is making destruction amongst some of the Swedes, but it is hoped not to the extent as to cause the land to be re-sown. Wheat has the appearance of making a bountiful crop. Oats are very backward, and in many situations very thin upon the ground. Barley was favoured with a fine seed season, and looks well. Sown grasses are making out very well upon good conditioned land, but upon poor and undrained lands they are very thin. Fat cattle have become very scarce, and consequently dear; sheep also sell at remunerating prices. Wool is much the same price as last year; Cheviot hog wool is worth from 1s 6d to 1s 8d per lb. Lean cattle and milch cows are low in price, and difficult to make into money. Horses that are good, both for draught and harness, are readily sold, and at good prices.—June 9.

#### BERWICKSHIRE.

Agricultural operations have met with no interruption in the course of the month which is now come to a close. Preparing of land for turnips went on in the best style, the sowing of which commenced in the middle of the month. The Swedish species are now nearly all in the ground, and the earliest sown are presenting a promising braid. The sowing of yellow turnips is going on, and of common about to begin. Our prevailing winds have been from the east, and the temperature lower than in many former years. Vegetation, of course, has been slower than we have seen it; but there is nothing discouraging in the aspect either of the growing crops or of the pastures. The latter afford a fair supply for the keeping stock, all of which are in good condition. Over the whole country winter wheat has a very promising appearance, and if the weather be favourable, the earliest sown will soon be in the shot blade. The earliest planted potatoes are making their appearance above ground. We hear of no complaint at present among agriculturists, but that prices will not enable them to pay their rent and defray other expenses.—June 1.

#### PERTSHIRE.

The seasonable May showers which followed the dry weather in the Spring months, have proved highly favourable to vegetation in general. The soil is now completely moistened, and with genial warmth every part of the growing crop will make rapid progress. In the higher districts wheat had a rather thin and unequal appearance about the date of our last, on dry bottoms the appearance has been much improved by the rains. In the lower districts the appearance of wheat is highly flattering. On ordinary soils the plants stand sufficiently close. On rich lands an over luxuriance may render that part of the crop more liable to be lodged by rains, after the plant has been some time in the ear. Oats having come up fair on all sorts of soils, have on dry bottoms improved much by the rain. On retentive soils the temperature has of late been rather low for producing a healthy vegetation, with so much moisture in the soil, and on such grounds, the foliage has a yellowish and rather sickly tinge, but on all friable loams, and well drained lands, oats have a promising appear-

ance; in some instances the grub or wireworms have been at work. On stubborn soils barley gave an unequal braid, but the rains have remedied that defect, and the plants now stand closer, and promise to ear evenly. Barley like oats show symptoms of too much moisture at the root on "water eaten" lands; with this exception the appearance is highly favourable. Cutting grass has improved much by the rains, but still it is likely to yield a light crop of hay. Pastures have improved much in the course of the month, and pease and beans have grown rapidly since the rains reached the root. Potatoes were all planted, with very few exceptions, by the 20th of May, and the soil was sufficiently moist for promoting their growth. In some situations where they were planted very early we have heard some few complaints of the seed tubers rotting: this disease cannot well be attributed, this season, to over dryness of the soil, and at present strong hopes are entertained that there will be little ground of complaint as to rotting. Fallows have received a furrow, and turnip ground is in a state of forward preparation.

Wheat is still low in price, in barley there is little to do. Oats are still in demand, but of them there is not much on hand. Cattle improved a shade in price at the Spring markets. Horses for some years past brought high prices compared with other stock, of late their price approximates more nearly to that of cattle.—June 2.

#### EAST LOTHIAN.

The wheat everywhere continues to improve, and, perhaps, in no former season were appearances ever more promising in regard to the bulk of the crop, although much depends on the weather during summer for its ultimate productiveness; some of the earliest fields are beginning to spindle, and in eight or ten days hence will be bursting into ear. The oats and barley have recovered their natural verdure, and are thriving vigorously, while the horse and hand hoe are actively employed among the drilled beans, as besides the benefit to them, much of the success of the following white crop depends upon their accurate cultivation. A considerable portion of the Swedish turnip is sown, and as the ground works uncommonly well, a continuation of the present favourable weather will allow that interesting branch of husbandry to be finished to the wishes of the farmer. As much had been said, through the medium of the press, and otherwise, in favour of *Trifolium Incarnatum*, a species of clover lately brought into notice in the south end of the island, different trials have been made of its value by sowing it last autumn, on some of the finest land in the country, but it has turned out a total failure. A new kind of rye grass, named the Italian rye-grass, and greatly lauded, has also been tried here. It was sown last spring in the usual manner, and this season it was obviously earlier than the common sort; it had a tender and succulent appearance, and seems relished by the stock where the land is pastured; but it will require more extended experience to speak decisively on the subject. In the Corn Markets, oats, beans, and peas, have for some time past been comparatively scarce, and the same appears to be the case generally through the country. Fat cattle have lately sold better than for months previous, and the demand for sheep and lambs continues fair, and the prices reasonable, yet many of the young sheep or hogs, from being bought in when lambs were at high prices, will leave when fat, but little profit to the grazier.—May 30.

## AGRICULTURAL INTELLIGENCE, FAIRS, &c.

**CHELMSFORD WOOL FAIR AND PRIZE CATTLE SHOW.**—The first Wool Fair for Essex, was held here June 16, under the patronage of the "Chelmsford and Essex Agricultural Association," and was well attended, notwithstanding the unavoidable absence of many of the neighbouring gentry, whose engagements, and among others their Parliamentary duties, which demanded their presence, and could not be dispensed with. The sheep, cow kine, swine, and horses, were all admired. Among those which excited the greatest curiosity was a three-year-old Merino wether, that had never been shorn, the property of Lord Western. This animal, the fleece of which was of the most beautiful quality, has been a great object with his lordship to make equally desirable to the butcher and the consumer as the fleece is to the manufacturer, and in this endeavour his lordship has in a great measure succeeded. A very considerable quantity of wool was disposed of, part produced in the bulk, and some by sample only. The prices varied from 15d to 16d for ewe, and 19d to 22d per lb for teg. The principal buyers were Messrs. Johns, Chelmsford; Unwin, Coggeshall; Matthews, Witham; Oram, Fyfield; Page, Manningtree, &c. &c. These gentlemen are required to send to Mr. Gilson, the Secretary, on or before Monday next, certificates of the quantities purchased by them, in order to determine to whom the silver cup offered by the Society, shall be awarded. The new Market House was open for the reception of the wool, and also of the company had the weather proved unfavourable. The sheep shearing attracted a large concourse of spectators. In this department, the skill exhibited by the competitors was various, but commendable in all.

The Prizes in the different classes were adjudged as follow:

### SHEEP.

Judges: Messrs. T. Seabrook, James Christy, and C. Matson.

**DOWN RAMS.**—1st prize of 2l 2s to Mr. I. Belcher, of Danbury.—2nd prize of 1l 1s to T. W. Bramston, Esq. M. P.—For these prizes there was no competition.

**LONG WOOL LAMBS.**—1st prize of 2l 2s to Mr. W. F. Hobbs, of Marks Hall.—2d prize of 1l 1s to Mr. S. Bridge, of Halstead, for a ram teg.—The other competitors were: Mr. T. Bridge, who showed a long wool ram hogget—much commended; Mr. Wm. Steele, a shearing ram; Mr. Henry Cleve; Mrs. Douglas, of Great Baddow, three Leicester rams, one, two, and three years old; and Mr. Wm. Gale, a Kent ram.

**DOWN HOGGETS.**—1st prize of 2l 2s to T. W. Bramston, Esq., M. P., whose pen of four ewe hoggets was the only one shown,

**LONG WOOL HOGGETS.**—1st prize 2l 2s to Mr. W. F. Hobbs.—2d prize of 1l 1s to Mr. Henry Cleve, of Rottendon.—The other competitors were: Mrs. Douglas, four Leicesters; Mr. Wm. Gale, four Kents; Mr. Thomas Bridge, four ewe hoggets, fourteen months old.

C. T. Tower, Esq., showed four beautiful hoggets, but being Merinos, the Judges did not consider them qualified. (The sheep generally were greatly admired.)

### STOCK.

Judges: C. C. Parker, Esq., and Messrs. W. Pavitt and J. Buttle.

**FOR THE BEST BULL.**—Mr. I. Blythe received a prize of 2l 2s for a short-horned two-year old bull, of beautiful symmetry; Mr. Bramston a prize of 30s for a yearling of the same stock.

**TWO YEAR-OLD HEIFERS.**—Mr. T. W. Crooks, a prize of 30s for a Durham.—The prize of 30s for the best Yearling Heifer was also awarded to Mr. Crooks.

Mr. R. Baker, of Writtle, obtained the prize of 30s for the best milch Cow, a Durham.

### HORSES.

Judges: Messrs. Robert Baker, William Crush, Philip Dowsett, and John Smith.

**CART STALLIONS.**—1st prize of 3l 3s to Mr. John

Upson, of Rivenhall, for a Suffolk stallion.—2d prize of 2l 2s to Mr. Wm. Simmons, of Little Baddow, for a home-bred.—Mr. Simmons exhibited two stallions in this class.

**CART MARES.**—1st prize of 2l 2s to Mr. William Seabrook, of Boreham, for a home-bred.—2d ditto of 1l 1s to Mr. Wm. Wright of East Hanningfield, for a home-bred.

### SWINE.

Judges: Messrs. M. Mason, Thomas Bridge, and T. W. Crooks.

**FOR THE BEST BOAR.**—Mr. Charles Milburn, of Great Baddow, a prize of 1l 1s for a very handsome boar of the Sussex breed.

**FOR THE BEST SOW.**—Sir John Tyrell, a prize of 1l 1s for a fine Neapolitan sow.

### WOOL.

Judges: Messrs. Thomas Johns, R. Oram, and Stephen Unwin, jun.

A prize of 2ls for the best down fleece—Mr. Isaac Belcher.

A similar prize for the best long fleece.—Mr. W. F. Hobbs.

### SHEARERS.

1st prize of 1l 1s for the best sheep shearers, clipping any of the sheep shown—Richard Jarvis, recommended by Mr. T. W. Crooks.

2d prizes of 10s 6d to Josiah Kemp, recommended by Mr. W. F. Hobbs.

3d prize of 5s Wm. Neale, recommended by Mr. T. Bridge.

At four o'clock, about 120 gentlemen, members of the Society and their friends, sat down to an excellent dinner at the Saracen's Head Inn, John Disney, Esq. the President, in the Chair.

## WISBEACH HORSE AND CATTLE FAIR.

—It is with great pleasure we announce that the regulations made for the improvement of this fair are attended with the most flattering prospects of success. On Thursday, June 11, a greater quantity of stock was exhibited than has been known for a number of years; the increase of company was very considerable; and, on the whole, there is no doubt but that the hopes of the most sanguine of its projectors will be realised. The stock shown for the premiums were in fine condition, and gave general satisfaction. The umpires, Mr. Isaac Mears, of Gedney Hill, and Mr. John Hall, of St. Mary's, near Lynn, having attentively viewed the horses, beasts, and sheep, retired to the White Hart Inn, where an excellent dinner was provided. The town bailiff, (Mr. Henry Leach,) with upwards of forty of the principal graziers in Wisbech and the neighbourhood, attended. After the customary toasts had been given, the chairman, Samuel Jealous, Esq., of Parson Drove, distributed the following premiums:—

Five Sovereigns to Mr. George Chapel, of Melbourn, in this county, for the best two-year-old cart gelding.

Five Sovs. to Mr. Freeman, of Spalding, for the best two-year-old filly.

Three Sovs. to Mr. Cork, of Tydd St. Giles, for the best yearling cart colt.

Three Sovs. to Wm. Ullett, Esq., of Wiltsthorpe, Lincolnshire, for the best yearling filly,

Five Sovs. to Mr. Charles Oldham, of Wisbech St. Mary, for the best half-score short-horned beasts.

Five Sovs. to Mr. John Murley, of Walsoken, for the best score of shearing wethers; and

Five Sovs. to Mr. Wm. Smith, of Tydd St. Mary's, for the best score of lambhogs.

Great praise is due to the umpires in making their award, selecting from many excellent animals those that were truly superior.—John Johnson, Esq., of Leverington, and Mr. Wm. Dow, of Needham Hall, showed some beasts which were generally admired. Some extra stock were exhibited, not with a view of

obtaining premiums, but to show the improved breed of animals in the neighbourhood; particularly a fine young short-horned bull, the property of Mr. John Peck, of Parson Drove; and a very superior ram lambbrog, bred by Mr. Porter, of West Walton, which for symmetry of frame, covered by an extraordinary fleece of wool, claimed much attention. A discussion took place respecting the utility of establishing a fat stock market at Wisbech. The town bailiff explained the views and wishes of several of the inhabitants, and it is contemplated to call an early meeting to forward so desirable an object. A considerable sum of money was collected in the room to continue the premiums next year. Many loyal and agricultural toasts were drunk, and the company separated highly gratified with the business of the day.

**THE DENVER SHEEP SHOW.**—It is not generally known that the Messrs. Brown of Denver and Wimbotsham, near Downham, have for many years turned their attention to rearing tups of the pure Leicester breed; and that they have established an annual meeting, open to all agriculturists for the disposal of these animals. The meeting for the present year took place on Wednesday the 10th of June, and was attended (besides many of the neighbouring farmers) by several friends from a distance, who, if not all practical farmers, were warmly interested in the success of agricultre. The sheep were exhibited with and without their fleeces (these were of remarkable length of staple and fine fibre, one measuring nearly 15 inches long,) and all the stages, from a hogget to a three, four, and even five year sheep, and were greatly admired for their symmetry, weight of wool, and for those various points which, in the estimation of good judges, go to make up a perfect animal. One thing respecting this excellent breed of sheep not a little staggered us, and that is, they have been bred in and in for the last forty years—in other words, neither male nor female of any other flock have been resorted to, to keep up the breed. We were assured of this fact by Mr. Chester, who had known the flock during the whole of that period. After viewing the sheep, the company set down to an excellent dinner, which had been prepared under an awning in front of the house. A variety of appropriate toasts were drunk, and the afternoon passed in conversation suitable to the occasion; in the course of which Mr. Cline's little treatise on the form of animals was adverted to by Messrs. Hunter, R. Childs, and others, as containing what may be termed the golden rules of breeding. Mr. Childs, who last year reprinted this work for distribution amongst his agricultural friends, very liberally offered copies of it to all who would accept the same and read it with attention. Having enjoyed the good things so plentifully provided by their worthy hosts and their fair relations, the company once more adjourned to the sheep-yard, where much business was done—by which it would appear they saw double the beauties in the stock after, than they did before dinner. We only hope the day passed off as profitably for the Messrs. Brown, as it did for their respective guests.

At **DERBY FAIR**, there was a tolerable good show of milking cows and store cattle; for the former there was a good attendance of buyers, but owing to the dry weather business was unusually dull, except in very fresh barren cows. In the sheep market there were only a few shown, and very little done. Horses were not numerous; a string or two of useful ones were exhibited, and good hacks, as well as smart ponies, were looked for, and might have reached improved prices.

#### LEWES COLT SHOW AND HORSE FAIR.

—On Tuesday last a meeting of the subscribers to the above Show and Fair was holden at the Star Inn, and we are gratified to learn that it was determined, that the exhibition shall again take place in the spring, which is decidedly the most preferable season of the year for the sale of riding and carriage horses, it being a period when the London dealers are generally in the market, although the cattle may not be in the condition in the spring, that they would be at the latter end of the summer. It is necessary, however, in order that colts may be bred to be profitable to the owners, that they should be well kept through the winter, and the fair being held in the spring, will, no doubt, be an inducement to the breeders to be particular in this respect.

**ROSS FAIR.**—The fat sheep at this fair were as plentiful as usual; small weights sold readily at full 5½d per lb, heavy sheep fetched only 5d, with a dull sale. There were few steers, but they sold at better prices than of late. A small supply of fat cows, which did not sell so well as at the last fair. Very few hack horses; good ones sold readily. Cart horses met with a dull sale.

**MONMOUTH FAIR** was not very numerously attended, but the business transacted was of a more lively description than of late, and there was a visible improvement in price. Fat cattle, of which description very few were brought to the fair, sold from 5½d to 6d per lb; cows and calves, steers and bullocks, full ten per cent. higher than at the monthly market. Sheep fetched 5½d to 6d; lambs, 6d to 6½d per lb; couples were in demand. Pigs experienced rather a dull sale. The horse fair was well attended, and a good deal of business was done.

**NORTHAMPTON WOOL FAIR** will be held on the 4th July. We take this opportunity of reminding shepherds who propose to become candidates for the premiums offered by the Farming and Grazing Society to the Shepherd who shall rear the largest number of lambs, that their certificates must be sent in on or before the day appointed for the wool fair.

**ROWELL ANNUAL FAIR** exhibited a large stock of store beasts, but few of good quality. All the latter were sold at high prices, as well as a great part of the inferior. This fair is usually supplied with large numbers of Scots. It is remarkable that on the present occasion not one was to be seen.

At **WHITTLESEY HORSE FAIR** there was a tolerable show of cart colts, which went off rather slowly at late prices. For nags the demand was better, and more might have been sold. A few short-horned steers were shown, but the prices demanded seemed too high.—At the show-yard for cart colts and fillies there was considerable competition; the prizes were awarded to—Thos. Bowker, Esq., of Whittlesey, for the best two-year-old cart gelding, 5 sovs.; to Mr. John Freeman, of Spalding, for the best two-year-old cart filly, 5 sovs.; to Mr. Wm. Nix, of Somersham, for the best yearling cart colt, 5 sovs.; to Mr. Chas. Boyce, of Whittlesey, for the best yearling cart filly, 5 sovs.

At **TURRET MARKET**, held at Crief, the supply of cattle, which consisted chiefly of lean stock, was large, for which there was but little demand, and prices considerably on the decline. Stots of two years old brought from 3l 10s to 5l 10s, being a reduction since last year of 15s a-head. Good fat, which was scarce, sold readily, and may be quoted at from 4s 6d to 5s 3d per imp. stone. The best in the market was four three-year-old stots, belonging to Sir Patrick Murray, Bart. Ochfortyre, which were sold at 15l each.

**NORTHAMPTON FAIR** presented a very poor show of store beasts. There was very little beef and not a great quantity of either mutton or lamb, but the greater part of what there was of the two latter sold at fair prices.

At **BIRMINGHAM WHITSUN FAIR**, there was a large show of horses, though but few were disposed of. In the cattle market pigs were not so numerous as they have been on former occasions. The prices of meat were as follow:—Beef averaging from 5d to 5½d per lb. of which there was a large supply, but the sale exceedingly dull; Mutton from 4½d to 5d; Veal, 5½d to 6d; Lamb, 6½d to 7d.

**MELTON WHIT FAIR** was but thinly attended, there were but few sheep and cows, horses and ponies more plentiful, some of which fetched good prices. The pleasure fair was not so well attended as might have been expected from the preparations that were previously made.

**TRINITY MUIR FAIR**.—At this great market the sale of sheep was good, and nearly all sold. Black-faced hill wethers brought from 15l to 21l; ewes and lambs, 12l to 18l; and hogs, from 10l to 12l per score. There was a fair show of cattle yesterday, for which the demand was rather slack, with the exception of prime fat, which sold briskly at 7s to 7s 3d per stone, and nearly all sold. Three-year-old stots brought from 8l to 13l; two-year-olds ditto, from 5l to 8l; year-olds ditto, 3l to 5l. Good fresh farrow cows and queys brought about 4s 6d to 5s per Dutch stone, estimated at what they will weigh when fat. The north country cattle stood long, and the dealers complain on the prices. Upon the whole, the market may be termed good for the best fat, but all other sorts were in slow request.

At **OSWESTRY FAIR**, live stock "looked up," fat cattle fetched from a penny to three half-pence per lb. more than a month ago, and all were sold. Calves sold well, and there was a great demand for sheep at improved prices; and all sold. Pigs also were on the rise. As to horses, the general observation is applicable here: "Good ones sold well, but for ordinary ones no demand."

**CHEAP PROVISIONS**.—At Gloucester market, on Saturday se'nnight, prime dry home cured bacon was retailed at 5d per lb. In the same city, the 4lb loaf of excellent bread is selling at 5d. In 1812 the bacon sold in Gloucester at 1s 2d, and the loaf of 4lbs 5½ ounces, at 1s 5d.

**BRESLAU WOOL FAIR**.—The German wool fairs have commenced, and we have been favoured with extracts from letters received in this town from Breslau, where the first fair is held. They concur in stating that the wools fetched prices fully as high as those of last year, and that the English manufacturers have bought largely. The following is an extract:—

"Breslau, June 7, 1835.

"This great wool fair has gone full higher in prices than I expected, and though the proportion brought to market has been larger than usual, it is nearly all sold at last year's prices.

"The English manufacturers and the Netherlanders are the greatest buyers, and have all bought largely; the dealers have mostly held off and bought little, on account of the high prices.

"The wools, generally speaking, have been but very indifferently washed at this fair, owing to the cold weather prior to the fair, and few buyers have pleased themselves as well as usual on that account.

"Some few of the clips that I purchased last year, and which were this year greasy and ill-washed, I could have purchased five per cent. cheaper than last year, but all wools that were clean washed, have gone full as high as last year."

**NORTH CLAY HOPS**.—During the early part of the season, good judges were of opinion that the crop in the Clays would be a decided failure. The recent seasonable rains have, however, materially changed the face of things within the last few days. The bine has assumed a more healthy appearance, and in some yards is six feet high. The late easterly winds had brought a considerable quantity of filth, which the heavy rain has washed away, so that many growers anticipate an average crop.—*Lincolnshire Chronicle*.

**THE CROPS**.—The appearance of the country is truly gratifying; the corn crops in general present prospects indicative of an abundant harvest—the agriculturist may now behold with gratitude signs of sample recompense for his past industry. The Wheat is already in ear in several places in this county, and as far of the county of Waterford as we have seen; and meadows exhibit such luxuriance that an ample supply of fodder may be anticipated. Potatoes present an anti-cobbett appearance. *Clonmell Advertiser*.

**THE CROPS**.—Hay harvest has already commenced in several of the southern counties. The grass, though later than usual, is well-bottomed, and the produce is abundant. The grain crops almost every where present a very luxuriant appearance: the wheat crops look particularly healthy. The apple and pear trees look well; the fruit has set, and an abundant produce is now expected.—*Colchester Gazette*.

**EARLY HARVEST**.—The late genial rains have been of immense service in bringing forward the young crops. A field of wheat, after fallow, in the parish of Gladsmuir, the property of John Veitch, Esq., Woodside, is already in ear, and promises shortly to be ready for the sickle.

**SINGULAR OCCURRENCE**.—Last week, a mare, the property of Mr. Lancaster, of Matherby Grange, near Thirsk, dropped a foal all perfect except one of its fore legs, which is divided at the knee, and from thence proceeds two feet, hoofs, &c. This curiosity is living and doing well.

**HARVEST PROSPECTS**.—The genial weather which we have had for some weeks past has effected a rapid and remarkable improvement in the crops in this part of the country. Specimens of wheat and oats, grown by Samuel Parsons, Esq., on the lands of Temple Gowran—and of oats, sown in September, on a light exhausted soil, by Mr. Thomas Crothers, of Glassdrummond—have been left at this office; they are pretty full in the ear, heavy, and healthy—the wheat particularly so. From these and other evidences of the fertility of the season, we are led to anticipate, under Providence, an early and what is still better—a plentiful harvest.—*Newry Telegraph*.

**WOOL**.—The weight as well as quality of the present year's clip is the subject of general remark, but the following circumstance it is believed is almost unprecedented. A few days since Mr. Hewett of Land Farm, Silverton, Devon, sheared a two year old ram, which gave the extraordinary quantity of 22½lbs. of wool, of 14 inches in length. This animal was sheared as a hog last year, and gave 18½lbs. of wool.

Haymaking has commenced extensively throughout the neighbouring counties, and the crops are considered heavy both in grass and clover. The apple trees promise abundance, but the appearance of the pears is not so good.—*Western Luminary*.

Mr. T. Falcon, of Workington, had a five acre field of grass cut on the 4th inst., and housed in capital condition on the 13th. This is the first of the hay harvest of the present season, in the neighbourhood of Workington.

## REVIEW OF THE CORN TRADE IN MARK LANE DURING THE MONTH OF JUNE.

During the past month, the malting season having entirely terminated, and all excitement in favour of barley having subsided, the consumptive as well as the speculative attention of the corn trade has been directed towards oats, and appears likely to be the only article that will command any interest on the market until harvest, "provided the weather continues favourable for the crops; indeed the opinion prevails, that the price of oats before the new produce can be brought into the consumption, will so far advance, as to cause a decline in the duties to a point, that will enable the importers of foreign qualities to pay the duties; which, however, unless any unforeseen casualties should arise, are not likely to decline lower than to 10s 9d for at least the next six weeks or two months. For though the deficiency both in the growth and produce of the last growth has been considerable in this country, and the consequent exports from Scotland and Ireland have greatly exceeded the shipments of any other season during a similar period, having received from the former country upwards of 125,000 qrs., and from the latter 150,000 qrs., yet the low price of wheat throughout England, Scotland, and Ireland, comparatively weight for weight, with that of Oats, has forced an increased demand, to an unusual extent, for the former article. In England, the mixture of inferior wheat in the food for horses, has been most successfully resorted to; in one instance, we know that a party, who is extensively concerned, as a proprietor of horses, and who feeds his cattle by *weight* instead of *quantity*, has, by the substitution of wheat, inferior barley, &c., effected a saving in his outlay of as much as 20l. per week, which is readily accounted for, when taken into the calculation, that the consumption is about 60 qrs. weekly, and the saving 3d in every 14lbs. For distilling purposes also less oats have been consumed, so that the demand, though more extensive than customary in Mark Lane, is yet proportionably less, than would otherwise have ensued, had the currency of wheat not been so depressed. In Scotland, flour has materially superseded the consumption of oatmeal, and it is even *subject of complaint*, that dealers in meal use a proportion of wheat with the oats, when being ground into meal, by which means they are enabled to undersell the fair trader, as oats are getting scarce, and prices improving, while the supplies of wheat are more than commensurate to the demand, and the prices uncommonly depressed. In Ireland, the grinding of oats into meal, has been diminished to a considerable extent, and more flour consumed than ever before experienced. Under these circumstances, the exports from both countries, but particularly the latter, may, and no doubt will, be this year augmented to an unprecedented amount. But, notwithstanding the various substitutions for oats, and

the extent of the imports into London, the period of sixteen to seventeen weeks must elapse before the new crop can be made available, and as the resources of Ireland are not inexhaustible, but on the contrary; at many of the principal ports the shipments in future to be expected are extremely limited, and as in Scotland, the exportations have been so excessive, that a re-import is, and will be required from Ireland, there is every reason to believe that recourse must be had to foreign supplies, though perhaps not to the extent, nor so soon, as has been anticipated by sanguine speculators.

The supplies of wheat during the commencement of the month having been limited, and the weather up to the 6th continuing cold and ungenial, the trade assumed more firmness, and prices advanced 1s to 2s per qr. The millers, however, very reluctantly submitted to higher demands. After the above period, the weather set in extremely warm and favourable for the crops, and the currencies receded fully 2s per qr. with a very heavy trade; towards, however, the close of the month we experienced one of those vicissitudes in the weather, for which our climate is remarkable, a glowing sunny atmosphere being exchanged for stormy wind and rain; and as the crops from their over-exuberance are rendered more liable to casualties from the weather, prices of the finer qualities of wheat evinced a tendency to improve, and 1s more money was realized.

Little interest has existed in bonded wheat, as the only chance left the speculator in foreign corn entirely depends on the state of the weather; for though the previous harvest was unusually early, and the ensuing is likely to be protracted to a later period, say three weeks or a month, by the cold and unfavourable temperature until the beginning of the month, added to the fact, that the consumption of wheat, both in its raw and manufactured state, is more extensive, than perhaps ever before experienced, yet the stocks are still so large throughout the kingdom, that no fluctuation of any moment can be expected from a falling off in the supply. At the close, however, of the month, owing to the rapid advance in the price of wheat in the United States, in consequence of the reported failures of the crops, some inquiry existed for wheat under lock at low prices, and holders were making shipments to America.

Flour has sustained little alteration in value, but the heat of the weather has rendered the sale heavy, purchasers only taking the quantity requisite to meet their immediate wants. The advices from New York having reported a sudden rise in the flour trade in America, and best brands being noted at 31s 6d per barrel, the bonded article has attracted some attention, sour quality being held at 17s to 19s, sweet at 22s to 24s. At Liverpool, large parcels of sour flour have been taken at 18s to 18s 6d; old sweet at 22s; fine, 24s.

The alterations in the duties consist of a decline of 1s per qr on wheat, making the duty at the close of the month 47s 8d, an advance of 1s 6d per qr on

barley, a decline of 3s per qr on beans, and 1s 3d per qr on peas.

The receipts of barley, both British and foreign, have been extremely limited, and as the malting season had closed at the commencement of the month, the prices of malting barley have remained perfectly nominal; Chevalier qualities being quoted at 34s to 35s, Norfolk and Suffolk 30s to 33s, distilling 29s to 32s. For grinding purposes, there exists a steady consumptive demand, which is principally met by the free foreign parcels in warehouse; stout Irish qualities realising 25s to 25s 6d; good English 27s to 28s. The better descriptions of foreign being worth 30s to 32s.

The malt trade has continued in a dull and inactive state, and with the exception of choice qualities, made from Chevalier barley, of which the samples offering form a very small proportion, sales could only be effected by submitting to a decline of 1s to 2s per qr.

The supplies of oats from Scotland and Ireland have been extensive, and exceeded those of the foregoing month by 17,185 qrs, but the arrivals from our own coast have been 1400 qrs less. The continued influx of oats, principally from the sister kingdom, has caused a depression in the prices, and though an extensive country, as well as speculative demand, has been experienced, yet sales could not be effected without submitting to a decline throughout the month of 1s 6d to 2s per qr, principally of Scotch and Irish samples. The trade however latterly has become more firm, with a tendency, on any diminution of the supplies taking place, to rally and regain the previous currency. The amount returned as sold in Mark Lane, comprises 114,721 qrs, but these accounts, from which the consumption is estimated, does not at any time, but more particularly during an excited period of the market, afford any just criterion of the fact, as many and the same parcels are purchased on speculation by different parties, and returned as sold to the inspector over and over again. In Ireland the leading houses at the principal shipping ports agree in stating, that they consider the exports for the present season fast drawing to a conclusion; and in fact the shipments during the last fortnight have been very limited to London, though they are increasing to some of the Scotch ports. The prospects therefore are improving as to the probable advance in value of the article, and the realisation of the anxious hopes of speculators. The free on board Irish sales have been partial; Galway qualities have obtained 12s 4d to 12s 9d per barrel; Derry do, 13s 3d; Limerick and Waterford do, 13s 4d to 14s. Owing to the increased supplies, oats in bond have rather receded in price; the late arrivals from Denmark, Jutland and Friesland having been stored in granary, as the prices demanded are higher than speculators at present feel inclined to accede to: fresh feed are held at 12s to 14s; brew, 16s to 17s.

The only article exclusive of oats which has created any speculative attention, is that of beans; and

as the crops have proved deficient in this country, recourse is had to foreign imports. The prices being almost always actuated by those of oats, the currency has latterly rather given way in value, and must be noted 1s per qr lower than in the early part of June. In Holstein, Mecklenburg, Hanover and Friesland, the ports of which countries are the nearest from whence we draw our supplies, have also had a crop much below an average produce, and prices have in consequence advanced with the demand, having ruled from 21s to 24s 6d and 25s, and the stock now almost exhausted. The duties have of late declined to 12s 6d. Tick qualities in bond are at present held at 26s to 28s; small, 27s to 28s; fine 30s.

Owing to the advance in the price of beans, old white peas have continued to meet enquiry, and sales to be effected for horse feed, which has caused prices to remain steady at the improvement of 1s to 2s per qr for the finest English qualities, and 1s per qr on foreign, of which the principal portion of the samples offering consist.

During the month of June the following quantity of grain and flour has arrived in the port of London.

|              | Wheat.<br>Qrs. | Barley.<br>Qrs. | Oats,<br>Qrs.    |
|--------------|----------------|-----------------|------------------|

In France the crops continue to hold forth the most promising appearances, though the thickness of the wheat on the ground has caused apprehensions for the result, as the grain is thus rendered very susceptible of injury from the weather, indeed the rains and hail have in some places already had the effect of laying it. Prices, however, are not yet affected by these circumstances, the highly favourable appearance of the produce still checking all speculative enterprise. In many districts the rain has been extremely heavy, and the inundations of several rivers have ensued, particularly of the Garonne and neighbouring streams, which have caused severe local loss. The quotations of wheat at Toulouse, Bordeaux, and adjacent markets, have in consequence advanced. In the vicinity, however, of Dunkirk, Bergues, Bourbourg, &c., the drought on the contrary, is beginning to prove detrimental to the summer grain, tares and linseed; the crop of the latter article having been almost entirely destroyed. At Paris the currencies remained steady of the better qualities of wheat, finest parcels being noted at 35s 10d to 38s 2d; secondary, 32s 8d to 35s: oats also were firm, heaviest samples obtaining 21s 4d to 21s 10d; prime parcels, 22s 1d to 22s 10d; secondary, 19s to 19s 11d. Wheat was not expected to undergo much further depression, as it was considered the crops were still liable to many accidents. From Marseille the reports state that the crops are excessively promising on the Rhine and in Provence and Languedoc, though the wet experienced would retard the harvest. Prices were languid, and nothing

passing in bonded wheat; owing to the closing of the Spanish ports. Rape plants are generally stated as being strong, and the yield likely to be productive.

The harvest in Italy will be rather later than usual, though the crops generally are satisfactory, and as the Spanish ports were closed, all incitement to speculation had for the present subsided. At Naples the stock of Barletta wheat was large, and prices declining. At Leghorn the supplies of foreign wheat were extensive, and should further arrivals be received from the Levant as well as the Neapolitan and Roman states, prices will further recede; Hamburg and Danzig wheats were not worth more than 25s free of all expenses. In Sicily the harvest was expected to be late, but the crops on the north and east coast promised very favourably.

At Odessa hard wheat continues to maintain a high currency, being quoted at 23s 7d to 28s 9d; soft qualities obtaining 22s 11d to 25s 6d; oats, 11s 10d to 13s 2d. The weather was favourable for the harvest, and the hopes were well founded for an abundant produce.

Considerable excitement has existed in the markets of the United States, owing to the failure of the crops and the quotations of flour and wheat, as well as other grain, and in fact provisions of all kinds are on the advance, and the former articles maintaining already a high range of price. At New York some Illinois wheat, which had arrived, via New Orleans, had realized 51s 4d. Rye was selling at 33s 6d; Indian corn at 33s to 36s; New York flour at 29s 3d; Western Canal and Baltimore, Howard-street, ditto., 31s 6d; rye flour, 18s per barrel. In Philadelphia the currencies are proportionably high, and the reports as to the wheat crop are unfavourable. At Baltimore the best brands were obtaining 27s 7d per barrel, and both flour and wheat were improving, owing to the statements as to the failure in the crops of wheat in the south. At Richmond the same articles had risen in value, in consequence of the gloomy prospect of the growing wheats, and the unfavourable character of the weather which had been experienced until the middle of May.

By the latest advices from Australia, the market at Sydney was well supplied with agricultural produce, and the prices low, as the harvest promised well. There had, however, been a failure in the vine plantations throughout the colony. At Van Diemen's Land flour was selling at 16l per ton, and the supply of the article, together with wheat, expected to be most abundant, the crops throughout the island being extremely satisfactory.

At St. Petersburg and Riga few transactions of any interest have taken place in grain. At Riga, rye, owing to the demand from the interior, had attained a higher range of price than wheat, being noted at 27s to 29s, and wheat 23s 6d to 27s 10d. Linseed, however, has continued to meet attention; Morschansky qualities realizing 44s 9d; and Riga, ditto., 40s 10d to 44s 3d and 46s 5d. At Danzig, the trade, though firm in price, has been dull, but prices steady at 29s to 31s for high-mixed qualities. The supplies have continued limited, and which are not likely to be much augmented, as the rates paid in the provinces are considerably higher than at Danzig; and such was the exhausted state of the stocks in the southern districts, that orders had been received for oats, barley, and rye, but of these articles there was little warehoused in the City. The resources also of the nearer places on the Vistula were greatly exhausted, and it was estimated, that the supplies of the country as well as

Poland were more limited than at any period since the year 1816. Petitions had been presented to government for a reduction in the excise duties on wheaten flour, which it appears are, in the towns, nearly four times as high as on rye. The weather had become extremely warm, which vegetation required. At Königsberg the currencies have remained firm, in consequence of the demand experienced from the interior, where, owing to the failures in the potato crop, great dearth of provisions existed. The Mecklenberg markets have sustained an improvement in the rates of wheat, in consequence of the steadiness of the prices in Holland, and the sales effected at Danzig on Prussian, Silesian, and Pomeranian account, best samples having obtained 24s. Latterly, however, the fine weather had rendered the quotations dull, and rather lower; barley, of 51 to 52 lbs, obtained 14s to 15s; the heaviest oats offering did not exceed 37 lbs, and which were noted at 12s to 13s. At Lübeck and Kiel, wheat remained at 22s 6d; barley, 15s; oats, 12s to 13s, as in weight. At Copenhagen the trade has been generally firm, a few sales of wheat had been made on Swedish account; a demand had also existed for rye to ship to Finland, and old barley to Norway; oats were held at 11s 6d to 12s 9d, as in quality. In Sweden, oats were realising the same rates. The weather had become favourable for the growth of the rape plants which had consequently much improved in their appearance, and the speculative purchasers of seed on delivery had been checked. At Copenhagen, as well as in Holstein and Schleswick, offers had declined to 26l 10s to 27l 10s. At Hamburg, the trade in wheat has not been animated, but oats and beans have both found purchasers: the former article, on the west coast of Holstein, was noted at 11s 6d to 12s, for quality of 34 to 35lbs. In Jeverland, the quotations were the same, freights varying from 2s to 2s 3d. In Jutland, oats of 38lbs have been bought at 11s 8d to 12s 4d, and on the west coast of Sweden, at 11s 10d to 12s 6d, weighing 38 to 39lbs. The stock of beans was nearly exhausted; small qualities on the Elbe and Jahde were held at 24s 6d to 25s; middling sized, 23s to 23s 6d. On the east coast of Holstein, the young rape plants are represented as looking very promising, but on the west coast, and in Jeverland, great numbers of insects, which have been brought to life by the very hot weather that had been experienced during the past week, had made their appearance, which, it was stated, would not only considerably diminish the quantity, but, it was feared, injure the quality of the seed. The Dutch have already begun their purchases, and a parcel of new Jutland seed has been sold on contract for delivery, at 7l 10s.

## THE FARMER'S MAGAZINE.

### POOR LAW STRUGGLE.

(From Cobbett's Register.)

"For it really appears to be another 'Rural War,' and threatens to be much more durable and mischievous than the last rural war; and there is this circumstance in addition, in this case; that is to say, that this new scene of trouble, of turmoil, and of boiling blood, has been caused by the Parliament itself; that Parliament duly warned by me of all the consequences. In this respect it is another Peel's-Bill affair. The proposition is made in the year 1833; the projectors are then warned, and are besought not to adopt the measure; they persevere a great deal more eagerly on account of the warning and the prediction, as if for the express purpose of making the prophet a liar. Half a dozen counties are in a state of partial commotion; the jails are opening the doors to receive those who are called the rebels against the Poor-law Bill. No matter as to any other thing relative to this measure; here is the country disturbed; here are the jails filling; here are wives and children screaming after their fathers; here are these undeniable facts, and what is the cause? Not a desire to overturn the Government on the part of the people; not a desire to disobey the settled laws of the country; not any revolutionary desire; not any desire to touch any one of the institutions of the country. What is it then? Why a desire and a resolution, as far as they are able to adhere to it, to maintain the laws of their country, as they were settled at the time when the present church of the country was established; to maintain those laws which form the foundation, the very fundamental principles of the Government; and which are of two hundred and forty years standing.

\* \* \* We shall bye-and-bye see the Duke of Richmond selling off from divers workhouses all the utensils for brewing, for grinding malt, for killing and preserving meat; we shall bye-and-bye see this Leviathan-pensioner at this amusing work; we shall bye-and-bye hear a poor law commissioner advising the guardians to look upon and treat poor persons coming for relief as 'beggars'; we shall bye-and-bye hear a peer chairman complaining of the destruction of cattle, and of fires being set; we shall bye-and-bye have to take a sort of survey of the blood boiling in Buckinghamshire, Bedfordshire, Kent, Sussex, and Suffolk. But, just at present, let us say that every one knows that this is at present the great immediate cause of trouble to the government. When old Grey, who was all thunder and all vigour, as long as he had cunning Althorp's majority at his back, and who became all feebleness and old age and incapacity as soon as he had lost that; when old Grey went snivelling off (having first not wholly forgotten his family) he complained of the difficulties in which the Government was placed; and it was curious enough that he had vigour enough left to offer, at that very moment, to bring in the Poor-Law Bill, which had been passed by t'other place. That

is to say, to make a greater difficulty than any that already existed, or than any that could by any possibility exist, short of an open and notorious rebellion and civil war. \* \* \* I will explain what the authors of the bill meant by 'swallowing up the estates of the landlords.' This singular race of beggars, called English landlords, have, in fact, generally speaking, no estates; that is to say, they have no ownership in the rents of those estates. They have a great share in the taxes, generally speaking; they have it in military, naval, diplomatic, sinecure, pension, parsonship, something or another; but these, though enormous in aggregate amount, are principally grasped by a comparative few; and, upon the whole, the havings in this way do not at all equal the amount of the rents of the estates. The money-mongers take those rents almost entirely, whether in interest or mortgage, or in taxes. The money-mongers own more than half the estates as mortgagees: they are every day bundling out the old stinking aristocracy, who have basely abandoned the working people. These old wretches, not able to sell and alienate for ever, first get away out of their mansions and sell their goods to get a ready penny; turn graziers, and, as carcass-butchers, send their venison to London to be eaten by the Jews, who have got the mortgages on their estates. They next think of the Game! All ideas of feudal honour fly from their minds. No longer the old pretence that the game is kept for sport, and that none but gentlemen ought to possess the game. After punishing men for two hundred years for selling or buying game, they pass a law to enable themselves to sell game, or to buy it, while they pass another law to transport a poor man, if he be in pursuit of it in the night-time. This trade of carcass-butcher and poulterer brings them a little relief; and enables them to live at Boulogne, or amongst the 'enchanted beauties' of the Swiss Cantons, and the 'high state' of morals there existing amongst the peasantry. Still the carcass-butcher and the poulterer do not yield enough to satisfy their wives, who probably have brought them a good supply. They resort to marriages with the daughters of contracting butchers, millionaire loan-mongers, old miser-jewellers, and the stock-jobbing crew, to say nothing of play-actresses in high feather, on whom they very frequently live until their voices get cracked; and then they abandon them to be buried by subscription; though it now and then happens that one of these women has the spirit to abandon them, and leave them to the enjoyment of their titles and their empty pockets. — The reformed parliament having, at any rate, blasted the hopes of getting at new heaps of spoil from the public purse; and the beggars finding that they have overdrawn with the poulterer and the retail butcher of their carcasses, look back again at the estates; and we will suppose my Lord Lump-skull sitting down with his steward to see if nothing is to be got out of the estate, and finally coming to the necessity of a Poor Law Bill. There has

been a run upon the shabby tawdry goods in town : my lady has almost been routed : down he comes to the village of Starve-gut ; squats himself down in a rage in a broken-bottomed rush chair, in a cob-webbed room where the servants used to be, and sends away for the steward some skeleton that he finds chopping about among the weeds in that garden where his grandfather had one gentleman employed with a dozen men under him, and two or three boys apprenticed to him, all of which the 'heddekated' son has discovered to have been excessively extravagant and foolish. Comes the steward upon a horse worth a hundred pounds ; and his servant in gay and rich livery, having taken away his horse, in he walks. \* \* Lumpskull. Oh ! as to reducing the taxes that is impossible. Althorp could not spare the malt-tax, and Peel could not spare it ; that Cobbett might talk as long as he likes, but we must keep 'national faith.'—Scut. Keeping faith is a very good thing to be sure, my lord ; but has 'national faith' been kept with you, whose estates has to pay interest for three times the sum that was borrowed ?—Lumpskull. That's very true, Mr. Scut ; as far as that goes you are right enough ; but there are other things besides the interest of the debt.—Scut. To be sure there are other things, but that is nothing to you. Make this deduction from the interest of the debt, at any rate.—Lumpskull. Ah ! Mr. Scut ; you do not seem to know what we may come to if we once begin. That amiable and excellent man, Sir James Graham ; that great statesman, so beautifully described by Harriet Wilson ; he proposed to take thirty per cent. from the interest of the debt at once ; and all of us landlords were delighted at the proposal ; when all at once, what does that d—m—d fellow Cobbett do ! You know the fellow, I suppose ?—Scut. Oh yes, my lord ! If we don't know him it is not the fault of his enemies, at any rate.—Lumpskull. Well ; what does that rascal do, think you. He sees what relief the proposition would bring us ; he pretends to be our friend : he is always bawling for the land, and against the funds ; and what now do you think this wicked devil did ?—Scut. 'Pon my word I cannot guess.—Lumpskull. Why, he said that the proposition of Graham was just, provided (now do mark this promise) that all unmerited pensions, sinecures, grants, retired allowances, useless places, military and naval half-pay, were clean lopped off at the same time : and that unless that were done, to reduce the interest of the debt would be an act of enormous injustice.—Scut. Well really my lord, I—Lumpskull. Really ! What do you agree with him then ? And so then you want my brother Tom to lose his half pay because he never saw a shot fired. You want my uncle Ned to lose his pension, which Pitt gave him for having lost his estate in a contested election. You want my uncle, The Rev. R. Lumpskull, to lose his place as chaplain and librarian ; you want my sister Sally's husband to lose his snug retired allowance, after a service of five years, and the abolition of his office. You want my brother Henry—in short, you want my whole family to be ruined.—Scut. Indeed I do not my lord. I want you to have an estate which you have not now ; and out of that estate to provide in proper manner for all your younger brothers and your sisters ; and to be what an English gentleman formerly was, the independent head of a family, living on his estate ; respected and beloved by all around ; and not the miserable dependant on whatever gabbling adventurer gets the handling of the public wealth into his power. By the present system of taxation you may be totally ruined and beggared, in spite of all your efforts to save yourself ; but without making such efforts you will rich-

ly merit your ruin ; in the one case, you will sink amidst the applause of all good men ; in the other case you will sink covered with their contempt ; and, as to your project for putting the wages of labour into your pocket by compelling Englishmen to submit to Irish treatment and Irish fare, all the reward you will receive will be the execration of the millions whom you vainly imagine you can succeed in oppressing. Now, stupid loggerheads of Saint George's Hanover-square, here are the true objects of the bill. This is the light in which the people all over the kingdom view it ; and everything that they see done towards the execution of the bill, convinces them that these reasons are here truly stated and described. There is as much of folly as of savage baseness in the supporters of this bill ; for, if they could bring the people to Irish fare, by the means of stipendiary magistrates and police, which they have always had in contemplation, where would they then find a market for their wheat at all ? And if this family of pensioned Lumpskulls could see the English labourers reduced from six shillings to two shillings a day, where would the taxes come from to pay their pensions ? Lumpskulls never think of this ; and they are carrying on a war (which is only just begun) from mere motives of greediness unparalleled, conjoined with ignorance unparalleled."

#### SPAIN.—THE QUADRUPLE TREATY.

(From the Morning Chronicle.)
